CHAPTER 1
**PROBLEM 1.1**

Two solid cylindrical rods $AB$ and $BC$ are welded together at $B$ and loaded as shown. Knowing that the average normal stress must not exceed 175 MPa in rod $AB$ and 150 MPa in rod $BC$, determine the smallest allowable values of $d_1$ and $d_2$.

![Diagram of rods AB and BC](image)

**SOLUTION**

(a) Rod $AB$

\[ P = 40 + 30 = 70 \text{ kN} = 70 \times 10^3 \text{ N} \]

\[ \sigma_{AB} = \frac{P}{A_{AB}} = \frac{P}{\frac{\pi}{4}d_1^2} = \frac{4P}{\pi d_1^2} \]

\[ d_1 = \sqrt[3]{\frac{4P}{\pi \sigma_{AB}}} = \sqrt[3]{\frac{(4)(70 \times 10^3)}{\pi(175 \times 10^6)}} = 22.6 \times 10^{-3} \text{ m} \quad d_1 = 22.6 \text{ mm} \]

(b) Rod $BC$

\[ P = 30 \text{ kN} = 30 \times 10^3 \text{ N} \]

\[ \sigma_{BC} = \frac{P}{A_{BC}} = \frac{P}{\frac{\pi}{4}d_2^2} = \frac{4P}{\pi d_2^2} \]

\[ d_2 = \sqrt[3]{\frac{4P}{\pi \sigma_{BC}}} = \sqrt[3]{\frac{(4)(30 \times 10^3)}{\pi(150 \times 10^6)}} = 15.96 \times 10^{-3} \text{ m} \quad d_2 = 15.96 \text{ mm} \]
Problem 1.2

Two solid cylindrical rods $AB$ and $BC$ are welded together at $B$ and loaded as shown. Knowing that $d_1 = 50 \text{ mm}$ and $d_2 = 30 \text{ mm}$, find the average normal stress at the midsection of (a) rod $AB$, (b) rod $BC$.

Solution

(a) Rod $AB$

\[
P = 40 + 30 = 70 \text{ kN} = 70 \times 10^3 \text{ N}
\]

\[
A = \frac{\pi}{4} d_1^2 = \frac{\pi}{4} (50)^2 = 1.9635 \times 10^3 \text{ mm}^2 = 1.9635 \times 10^{-3} \text{ m}^2
\]

\[
\sigma_{AB} = \frac{P}{A} = \frac{70 \times 10^3}{1.9635 \times 10^{-3}} = 35.7 \times 10^6 \text{ Pa}
\]

$\sigma_{AB} = 35.7 \text{ MPa}$

(b) Rod $BC$

\[
P = 30 \text{ kN} = 30 \times 10^3 \text{ N}
\]

\[
A = \frac{\pi}{4} d_2^2 = \frac{\pi}{4} (30)^2 = 706.86 \text{ mm}^2 = 706.86 \times 10^{-6} \text{ m}^2
\]

\[
\sigma_{BC} = \frac{P}{A} = \frac{30 \times 10^3}{706.86 \times 10^{-6}} = 42.4 \times 10^6 \text{ Pa}
\]

$\sigma_{BC} = 42.4 \text{ MPa}$
PROBLEM 1.3

Two solid cylindrical rods $AB$ and $BC$ are welded together at $B$ and loaded as shown. Determine the magnitude of the force $P$ for which the tensile stress in rod $AB$ is twice the magnitude of the compressive stress in rod $BC$.

SOLUTION

\[
A_{AB} = \frac{\pi}{4} (2)^2 = 3.1416 \text{ in}^2
\]

\[
\sigma_{AB} = \frac{P}{A_{AB}} = \frac{P}{3.1416} = 0.31831P
\]

\[
A_{BC} = \frac{\pi}{4} (3)^2 = 7.0686 \text{ in}^2
\]

\[
\sigma_{BC} = \frac{(2)(30) - P}{A_{AB}} = \frac{60 - P}{7.0686} = 8.4883 - 0.14147P
\]

Equating $\sigma_{AB}$ to $2\sigma_{BC}$

\[
0.31831P = 2(8.4883 - 0.14147P)
\]

\[
P = 28.2 \text{ kips}
\]
PROBLEM 1.4

In Prob. 1.3, knowing that \( P = 40 \) kips, determine the average normal stress at the midsection of \((a)\) rod \(AB\), \((b)\) rod \(BC\).

PROBLEM 1.3 Two solid cylindrical rods \(AB\) and \(BC\) are welded together at \(B\) and loaded as shown. Determine the magnitude of the force \(P\) for which the tensile stress in rod \(AB\) is twice the magnitude of the compressive stress in rod \(BC\).

SOLUTION

\((a)\) Rod \(AB\)

\[ P = 40 \text{ kips (tension)} \]

\[ A_{AB} = \frac{\pi d_{AB}^2}{4} = \frac{\pi (2)^2}{4} = 3.1416 \text{ in}^2 \]

\[ \sigma_{AB} = \frac{P}{A_{AB}} = \frac{40}{3.1416} \]

\[ \sigma_{AB} = 12.73 \text{ ksi} \uparrow \]

\((b)\) Rod \(BC\)

\[ F = 40 - (2)(30) = -20 \text{ kips, i.e., 20 kips compression.} \]

\[ A_{BC} = \frac{\pi d_{BC}^2}{4} = \frac{\pi (3)^2}{4} = 7.0686 \text{ in}^2 \]

\[ \sigma_{BC} = \frac{F}{A_{BC}} = \frac{-20}{7.0686} \]

\[ \sigma_{BC} = -2.83 \text{ ksi} \uparrow \]
PROBLEM 1.5

Two steel plates are to be held together by means of 16-mm-diameter high-strength steel bolts fitting snugly inside cylindrical brass spacers. Knowing that the average normal stress must not exceed 200 MPa in the bolts and 130 MPa in the spacers, determine the outer diameter of the spacers that yields the most economical and safe design.

SOLUTION

At each bolt location the upper plate is pulled down by the tensile force $P_b$ of the bolt. At the same time, the spacer pushes that plate upward with a compressive force $P_s$ in order to maintain equilibrium.

For the bolt,

$$P_b = P_s$$

For the bolt,

$$\sigma_b = \frac{F_b}{A_b} = \frac{4P_b}{\pi d_b^2} \quad \text{or} \quad P_b = \frac{\pi}{4} \sigma_b d_b^2$$

For the spacer,

$$\sigma_s = \frac{P_s}{A_s} = \frac{4P_s}{\pi (d_s^2 - d_b^2)} \quad \text{or} \quad P_s = \frac{\pi}{4} \sigma_s (d_s^2 - d_b^2)$$

Equating $P_b$ and $P_s$,

$$\frac{\pi}{4} \sigma_b d_b^2 = \frac{\pi}{4} \sigma_s (d_s^2 - d_b^2)$$

$$d_s = \sqrt{1 + \frac{\sigma_b}{\sigma_s}} d_b = \sqrt{1 + \frac{200}{130}} (16) \quad \Rightarrow \quad d_s = 25.2 \text{ mm}$$
PROBLEM 1.6

Two brass rods $AB$ and $BC$, each of uniform diameter, will be brazed together at $B$ to form a nonuniform rod of total length 100 m, which will be suspended from a support at $A$ as shown. Knowing that the density of brass is 8470 kg/m$^3$, determine $(a)$ the length of rod $AB$ for which the maximum normal stress in $ABC$ is minimum, $(b)$ the corresponding value of the maximum normal stress.

SOLUTION

Areas:

$A_{AB} = \frac{\pi}{4}(15 \text{ mm})^2 = 176.71 \text{ mm}^2 = 176.71 \times 10^{-6} \text{ m}^2$

$A_{BC} = \frac{\pi}{4}(10 \text{ mm})^2 = 78.54 \text{ mm}^2 = 78.54 \times 10^{-6} \text{ m}^2$

From geometry, $b = 100 - a$

Weights:

$W_{AB} = \rho g A_{AB} \ell_{AB} = (8470)(9.81)(176.71 \times 10^{-6})a = 14.683a$

$W_{BC} = \rho g A_{BC} \ell_{BC} = (8470)(9.81)(78.54 \times 10^{-6})(100 - a) = 652.59 - 6.526a$

Normal stresses:

At $A$,

$P_A = W_{AB} + W_{BC} = 652.59 + 8.157a$

$\sigma_A = \frac{P_A}{A_{AB}} = 3.6930 \times 10^6 + 46.160 \times 10^3a$

At $B$,

$P_B = W_{BC} = 652.59 - 6.526a$

$\sigma_B = \frac{P_B}{A_{BC}} = 8.3090 \times 10^6 - 83.090 \times 10^3a$

$(a)$ Length of rod $AB$. The maximum stress in $ABC$ is minimum when $\sigma_A = \sigma_B$ or

$4.6160 \times 10^6 - 129.25 \times 10^3a = 0$

$a = 35.71 \text{ m}$

$\ell_{AB} = a = 35.7 \text{ m}$

$(b)$ Maximum normal stress.

$\sigma_A = 3.6930 \times 10^6 + (46.160 \times 10^3)(35.71)$

$\sigma_B = 8.3090 \times 10^6 - (83.090 \times 10^3)(35.71)$

$\sigma_A = \sigma_B = 5.34 \times 10^6 \text{ Pa}$

$\sigma = 5.34 \text{ MPa}$
PROBLEM 1.7

Each of the four vertical links has an 8 × 36-mm uniform rectangular cross section and each of the four pins has a 16-mm diameter. Determine the maximum value of the average normal stress in the links connecting (a) points B and D, (b) points C and E.

SOLUTION

Use bar \(ABC\) as a free body.

\[
\Sigma M_B = 0 : \quad (0.040) F_{BD} - (0.025 + 0.040)(20 \times 10^3) = 0
\]

\[F_{BD} = 32.5 \times 10^3 \text{ N} \quad \text{Link } BD \text{ is in tension.}\]

\[
\Sigma M_B = 0 : \quad -(0.040) F_{CE} - (0.025)(20 \times 10^3) = 0
\]

\[F_{CE} = -12.5 \times 10^3 \text{ N} \quad \text{Link } CE \text{ is in compression.}\]

Net area of one link for tension = \((0.008)(0.036 - 0.016) = 160 \times 10^{-6} \text{ m}^2\).

For two parallel links, \(A_{\text{net}} = 320 \times 10^{-6} \text{ m}^2\)

\[(a) \quad \sigma_{BD} = \frac{F_{BD}}{A_{\text{net}}} = \frac{32.5 \times 10^3}{320 \times 10^{-6}} = 101.56 \times 10^6 \]

\[\sigma_{BD} = 101.6 \text{ MPa} \quad \nabla\]

Area for one link in compression = \((0.008)(0.036) = 288 \times 10^{-6} \text{ m}^2\).

For two parallel links, \(A = 576 \times 10^{-6} \text{ m}^2\)

\[(b) \quad \sigma_{CE} = \frac{F_{CE}}{A} = \frac{-12.5 \times 10^3}{576 \times 10^{-6}} = -21.70 \times 10^{-6} \]

\[\sigma_{CE} = -21.7 \text{ MPa} \quad \nabla\]
PROBLEM 1.8

Knowing that the link $DE$ is $\frac{1}{8}$ in. thick and 1 in. wide, determine the normal stress in the central portion of that link when 

(a) $\theta = 0^\circ$,  
(b) $\theta = 90^\circ$.

SOLUTION

Use member $CEF$ as a free body.

\[ \sum M_C = 0: \quad -12 F_{DE} - (8)(60 \sin \theta) - (16)(60 \cos \theta) = 0 \]

\[ F_{DE} = -40 \sin \theta - 80 \cos \theta \text{ lb.} \]

\[ A_{DE} = (1) \left( \frac{1}{8} \right) = 0.125 \text{ in.}^2 \]

\[ \sigma_{DE} = \frac{F_{DE}}{A_{DE}} \]

(a) $\theta = 0^\circ$: $F_{DE} = -80$ lb.

\[ \sigma_{DE} = \frac{-80}{0.125} = -640 \text{ psi} \]

(b) $\theta = 90^\circ$: $F_{DE} = -40$ lb.

\[ \sigma_{DE} = \frac{-40}{0.125} = -320 \text{ psi} \]
PROBLEM 1.9

Link $AC$ has a uniform rectangular cross section $\frac{1}{16}$ in. thick and $\frac{1}{4}$ in. wide. Determine the normal stress in the central portion of the link.

SOLUTION

Free Body Diagram of Plate

Note that the two 240-lb forces form a couple of moment

$$(240 \text{ lb})(6 \text{ in.}) = 1440 \text{ lb} \cdot \text{in.}$$

$$+ \Sigma M_B = 0 : \quad 1440 \text{ lb} \cdot \text{in} - (F_{AC} \cos 30^\circ)(10 \text{ in.}) = 0$$

$$F_{AC} = 166.277 \text{ lb.}$$

Area of link:

$$A_{AC} = \left(\frac{1}{16}\right) \text{ in.} \cdot \left(\frac{1}{4}\right) \text{ in.} = 0.015625 \text{ in.}^2$$

Stress:

$$\sigma_{AC} = \frac{F_{AC}}{A_{AC}} = \frac{166.277}{0.015625} = 10640 \text{ psi}$$

$$\sigma_{AC} = 10.64 \text{ ksi}$$
PROBLEM 1.10

Three forces, each of magnitude $P = 4$ kN, are applied to the mechanism shown. Determine the cross-sectional area of the uniform portion of rod $BE$ for which the normal stress in that portion is $+100$ MPa.

SOLUTION

Draw free body diagrams of $AC$ and $CD$.

Free Body $CD$:

$\Sigma M_C = 0: \ 0.150P - 0.250C = 0$

$C = 0.6P$

Free Body $AC$:

$M_A = 0: \ 0.150F_{BE} - 0.350P - 0.450P - 0.450C = 0$

$F_{BE} = \frac{1.07}{0.150} = 7.1333 \ P = (7.133)(4 \text{ kN}) = 28.533 \text{ kN}$

Required area of $BE$:

$\sigma_{BE} = \frac{F_{BE}}{A_{BE}}$

$A_{BE} = \frac{F_{BE}}{\sigma_{BE}} = \frac{28.533 \times 10^3}{100 \times 10^6} = 285.33 \times 10^{-6} \text{ m}^2$

$A_{BE} = 285 \text{ mm}^2 \blacktriangle$
**PROBLEM 1.11**

The frame shown consists of four wooden members, \(ABC\), \(DEF\), \(BE\), and \(CF\). Knowing that each member has a 2 \(\times\) 4-in. rectangular cross section and that each pin has a 1/2-in. diameter, determine the maximum value of the average normal stress \((a)\) in member \(BE\), \((b)\) in member \(CF\).

**SOLUTION**

Add support reactions to figure as shown.

Using entire frame as free body,

\[
\Sigma M_A = 0: \quad 40 D_x - (45 + 30)(480) = 0
\]

\[D_x = 900 \text{ lb.}\]

Use member \(DEF\) as free body.

Reaction at \(D\) must be parallel to \(BE\) and \(CF\).

\[
\Sigma M_D = 0:\quad - (30) \left( \frac{4}{5} F_{BE} \right) - (30 + 15) D_y = 0
\]

\[F_{BE} = -2250 \text{ lb.}\]

\[
\Sigma M_E = 0:\quad (30) \left( \frac{4}{5} F_{CE} \right) - (15) D_y = 0
\]

\[F_{CE} = 750 \text{ lb.}\]

Stress in compression member \(BE\)

Area: \(A = 2 \text{ in} \times 4 \text{ in} = 8 \text{ in}^2\)

\[(a) \quad \sigma_{BE} = \frac{F_{BE}}{A} = \frac{-2250}{8} = -281 \text{ psi} \quad \triangleleft\]

Minimum section area occurs at pin.

\[A_{\text{min}} = (2)(4.0 - 0.5) = 7.0 \text{ in}^2\]

\[(b) \quad \sigma_{CF} = \frac{F_{CF}}{A_{\text{min}}} = \frac{750}{7.0} = 107.1 \text{ psi} \quad \triangleleft\]
**PROBLEM 1.12**

For the Pratt bridge truss and loading shown, determine the average normal stress in member $BE$, knowing that the cross-sectional area of that member is 5.87 in$^2$.

**SOLUTION**

Use entire truss as free body.

$$+\sum M_H = 0: \quad (9)(80) + (18)(80) + (27)(80) - 36A_y = 0$$

$$A_y = 120 \text{ kips}$$

Use portion of truss to the left of a section cutting members $BD$, $BE$, and $CE$.

$$+\sum F_y = 0: \quad 120 - 80 - \frac{12}{15}F_{BE} = 0 \quad \therefore F_{BE} = 50 \text{ kips}$$

$$\sigma_{BE} = \frac{F_{BE}}{A} = \frac{50 \text{ kips}}{5.87 \text{ in}^2}$$

$$\sigma_{BE} = 8.52 \text{ ksi}$$
PROBLEM 1.13

An aircraft tow bar is positioned by means of a single hydraulic cylinder connected by a 25-mm-diameter steel rod to two identical arm-and-wheel units DEF. The mass of the entire tow bar is 200 kg, and its center of gravity is located at G. For the position shown, determine the normal stress in the rod.

SOLUTION

FREE BODY – ENTIRE TOW BAR:

\[ W = (200 \text{ kg})(9.81 \text{ m/s}^2) = 1962.00 \text{ N} \]
\[ + \sum M_A = 0: \quad 850R - 1150(1962.00 \text{ N}) = 0 \]
\[ R = 2654.5 \text{ N} \]

FREE BODY – BOTH ARM & WHEEL UNITS:

\[ \tan \alpha = \frac{100}{675} \quad \alpha = 8.4270^\circ \]
\[ + \sum M_E = 0: \quad (F_{CD} \cos \alpha)(550) - R(500) = 0 \]
\[ F_{CD} = \frac{500}{550 \cos 8.4270^\circ}(2654.5 \text{ N}) \]
\[ = 2439.5 \text{ N} \quad \text{(comp.)} \]
\[ \sigma_{CD} = \frac{F_{CD}}{A_{CD}} = -\frac{2439.5 \text{ N}}{\pi(0.0125 \text{ m})^2} \]
\[ = -4.9697 \times 10^6 \text{ Pa} \quad \sigma_{CD} = -4.97 \text{ MPa} \]
PROBLEM 1.14

A couple $\mathbf{M}$ of magnitude 1500 N $\cdot$ m is applied to the crank of an engine. For the position shown, determine (a) the force $\mathbf{P}$ required to hold the engine system in equilibrium, (b) the average normal stress in the connecting rod $BC$, which has a 450-mm$^2$ uniform cross section.

SOLUTION

Use piston, rod, and crank together as free body. Add wall reaction $H$ and bearing reactions $A_x$ and $A_y$.

$$
\sum M_A = 0 : (0.280 \text{ m})H - 1500 \text{ N} \cdot \text{m} = 0
\
H = 5.3571 \times 10^3 \text{N}
$$

Use piston alone as free body. Note that rod is a two-force member; hence the direction of force $F_{BC}$ is known. Draw the force triangle and solve for $P$ and $F_{BE}$ by proportions.

$$
l = \sqrt{200^2 + 60^2} = 208.81 \text{ mm}
\
\frac{P}{H} = \frac{200}{60} \quad \therefore \quad P = 17.86 \times 10^3 \text{N}
$$

(a) $P = 17.86 \text{kN}$

$$
\frac{F_{BC}}{H} = \frac{208.81}{60} \quad \therefore \quad F_{BC} = 18.643 \times 10^3 \text{N}
$$

Rod $BC$ is a compression member. Its area is

$$
450 \text{ mm}^2 = 450 \times 10^{-6} \text{m}^2
$$

Stress,

$$
\sigma_{BC} = \frac{-F_{BC}}{A} = \frac{-18.643 \times 10^5}{450 \times 10^{-6}} = -41.4 \times 10^6 \text{Pa}
$$

(b) $\sigma_{BC} = -41.4 \text{ MPa}$
PROBLEM 1.15

When the force $P$ reached 8 kN, the wooden specimen shown failed in shear along the surface indicated by the dashed line. Determine the average shearing stress along that surface at the time of failure.

SOLUTION

Area being sheared: $A = 90 \text{ mm} \times 15 \text{ mm} = 1350 \text{ mm}^2 = 1350 \times 10^{-6} \text{ m}^2$

Force: $P = 8 \times 10^3 \text{ N}$

Shearing stress: $\tau = \frac{P}{A} - \frac{8 \times 10^3}{1350 \times 10^{-6}} = 5.93 \times 10^6 \text{ Pa}$

$\tau = 5.93 \text{ MPa}$
PROBLEM 1.16

The wooden members $A$ and $B$ are to be joined by plywood splice plates, that will be fully glued on the surfaces in contact. As part of the design of the joint, and knowing that the clearance between the ends of the members is to be $\frac{1}{4}$ in., determine the smallest allowable length $L$ if the average shearing stress in the glue is not to exceed 120 psi.

SOLUTION

There are four separate areas that are glued. Each of these areas transmits one half the 5.8 kip force. Thus

$$F = \frac{1}{2} P = \frac{1}{2} (5.8) = 2.9 \text{ kips} = 2900 \text{ lb}.$$  

Let $l =$ length of one glued area and $w = 4 \text{ in.}$ be its width.

For each glued area, $A = lw$

Average shearing stress:

$$\tau = \frac{F}{A} = \frac{F}{lw}$$

The allowable shearing stress is $\tau = 120 \text{ psi}$

Solving for $l$,

$$l = \frac{F}{\tau w} = \frac{2900}{(120)(4)} = 6.0417 \text{ in.}$$

Total length $L$:

$$L = l + \text{(gap)} + l = 6.0417 + \frac{1}{4} + 6.0417$$

$$L = 12.33 \text{ in.}$$
PROBLEM 1.17

A load \( P \) is applied to a steel rod supported as shown by an aluminum plate into which a 0.6-in.-diameter hole has been drilled. Knowing that the shearing stress must not exceed 18 ksi in the steel rod and 10 ksi in the aluminum plate, determine the largest load \( P \) that can be applied to the rod.

SOLUTION

For steel:

\[
A_1 = \pi dt = \pi(0.6)(0.4) = 0.7540 \text{ in}^2
\]

\[
\tau_1 = \frac{P}{A_1} \therefore P = A_1\tau_1 = (0.7540)(18) = 13.57 \text{ kips}
\]

For aluminum:

\[
A_2 = \pi dt = \pi(1.6)(0.25) = 1.2566 \text{ in}^2
\]

\[
\tau_2 = \frac{P}{A_2} \therefore P = A_2\tau_2 = (1.2566)(10) = 12.57 \text{ kips}
\]

Limiting value of \( P \) is the smaller value, so \( P = 12.57 \text{ kips} \)
PROBLEM 1.18

Two wooden planks, each 22 mm thick and 160 mm wide, are joined by the glued mortise joint shown. Knowing that the joint will fail when the average shearing stress in the glue reaches 820 kPa, determine the smallest allowable length $d$ of the cuts if the joint is to withstand an axial load of magnitude $P = 7.6$ kN.

SOLUTION

Seven surfaces carry the total load $P = 7.6$ kN = $7.6 \times 10^3$.

Let $t = 22$ mm.

Each glue area is $A = dt$

$$\tau = \frac{P}{7A} \quad A = \frac{P}{7\tau} = \frac{7.6 \times 10^3}{(7)(820 \times 10^3)} = 1.32404 \times 10^{-3} \text{ m}^2$$

$$= 1.32404 \times 10^3 \text{ mm}^2$$

$$d = \frac{A}{t} = \frac{1.32404 \times 10^3}{22} = 60.2 \quad d = 60.2 \text{ mm}$$
PROBLEM 1.19

The load $P$ applied to a steel rod is distributed to a timber support by an annular washer. The diameter of the rod is 22 mm and the inner diameter of the washer is 25 mm, which is slightly larger than the diameter of the hole. Determine the smallest allowable outer diameter $d$ of the washer, knowing that the axial normal stress in the steel rod is 35 MPa and that the average bearing stress between the washer and the timber must not exceed 5 MPa.

SOLUTION

Steel rod: $A = \frac{\pi}{4}(0.022)^2 = 380.13 \times 10^{-6}$ m$^2$

\[ \sigma = 35 \times 10^6 \text{Pa} \]

\[ P = \sigma A = (35 \times 10^6)(380.13 \times 10^{-6}) \]

\[ = 13.305 \times 10^3 \text{N} \]

Washer: $\sigma_b = 5 \times 10^6 \text{Pa}$

Required bearing area:

\[ A_b = \frac{P}{\sigma_b} = \frac{13.305 \times 10^3}{5 \times 10^6} = 2.6609 \times 10^{-3} \text{m}^2 \]

But, $A_b = \frac{\pi}{4}(d^2 - d_i^2)$

\[ d^2 = d_i^2 + \frac{4A_b}{\pi} \]

\[ = (0.025)^2 + \frac{(4)(2.6609 \times 10^{-3})}{\pi} \]

\[ = 4.013 \times 10^{-3} \text{m}^2 \]

\[ d = 63.3 \times 10^{-3} \text{m} \]

$d = 63.3 \text{ mm}$
PROBLEM 1.20

The axial force in the column supporting the timber beam shown is $P = 20$ kips. Determine the smallest allowable length $L$ of the bearing plate if the bearing stress in the timber is not to exceed 400 psi.

SOLUTION

Bearing area: $A_b = Lw$

$$\sigma_b = \frac{P}{A_b} = \frac{P}{Lw}$$

$$L = \frac{P}{\sigma_b w} = \frac{20 \times 10^3}{(400)(6)} = 8.33 \text{ in.}$$

$L = 8.33 \text{ in.}$
PROBLEM 1.21

An axial load \( P \) is supported by a short W8 × 40 column of cross-sectional area \( A = 11.7 \text{ in.}^2 \) and is distributed to a concrete foundation by a square plate as shown. Knowing that the average normal stress in the column must not exceed 30 ksi and that the bearing stress on the concrete foundation must not exceed 3.0 ksi, determine the side \( a \) of the plate that will provide the most economical and safe design.

SOLUTION

For the column \( \sigma = \frac{P}{A} \) or

\[
P = \sigma A = (30)(11.7) = 351 \text{ kips}
\]

For the \( a \times a \) plate, \( \sigma = 3.0 \text{ ksi} \)

\[
A = \frac{P}{\sigma} = \frac{351}{3.0} = 117 \text{ in}^2
\]

Since the plate is square, \( A = a^2 \)

\[
a = \sqrt{A} = \sqrt{117}
\]

\[
a = 10.82 \text{ in.}
\]

PROBLEM 1.22

A 40-kN axial load is applied to a short wooden post that is supported by a concrete footing resting on undisturbed soil. Determine (a) the maximum bearing stress on the concrete footing, (b) the size of the footing for which the average bearing stress in the soil is 145 kPa.

SOLUTION

(a) Bearing stress on concrete footing.

\[ P = 40 \, \text{kN} = 40 \times 10^3 \, \text{N} \]
\[ A = (100)(120) = 12 \times 10^3 \, \text{mm}^2 = 12 \times 10^{-3} \, \text{m}^2 \]
\[ \sigma = \frac{P}{A} = \frac{40 \times 10^3}{12 \times 10^{-3}} = 3.333 \times 10^6 \, \text{Pa} \]
\[ 3.33 \, \text{MPa} \]

(b) Footing area. \[ P = 40 \times 10^3 \, \text{N} \quad \sigma = 145 \, \text{kPa} = 45 \times 10^3 \, \text{Pa} \]

\[ \sigma = \frac{P}{A} \quad A = \frac{P}{\sigma} = \frac{40 \times 10^3}{145 \times 10^3} = 0.27586 \, \text{m}^2 \]

Since the area is square, \[ A = b^2 \]
\[ b = \sqrt{A} = \sqrt{0.27586} = 0.525 \, \text{m} \]
\[ b = 525 \, \text{mm} \]
PROBLEM 1.23

A $\frac{5}{8}$-in.-diameter steel rod $AB$ is fitted to a round hole near end $C$ of the wooden member $CD$. For the loading shown, determine (a) the maximum average normal stress in the wood, (b) the distance $b$ for which the average shearing stress is 100 psi on the surfaces indicated by the dashed lines, (c) the average bearing stress on the wood.

**SOLUTION**

(a) Maximum normal stress in the wood

\[
A_{net} = (1) \left( 4 - \frac{5}{8} \right) = 3.375 \text{ in.}^2
\]

\[
\sigma = \frac{P}{A_{net}} = \frac{1500}{3.375} = 444 \text{ psi}
\]

$\sigma = 444 \text{ psi}$

(b) Distance $b$ for $\tau = 100$ psi

For sheared area see dotted lines.

\[
\tau = \frac{P}{A} = \frac{P}{2bt}
\]

\[
b = \frac{P}{2\tau} = \frac{1500}{(2)(1)(100)} = 7.50 \text{ in.}
\]

$b = 7.50 \text{ in.}$

(c) Average bearing stress on the wood

\[
\sigma_b = \frac{P}{A_b} = \frac{P}{d} = \frac{1500}{\left( \frac{5}{8} \right)(1)} = 2400 \text{ psi}
\]

$\sigma_b = 2400 \text{ psi}$
PROBLEM 1.24

Knowing that $\theta = 40^\circ$ and $P = 9$ kN, determine (a) the smallest allowable diameter of the pin at $B$ if the average shearing stress in the pin is not to exceed 120 MPa, (b) the corresponding average bearing stress in member $AB$ at $B$, (c) the corresponding average bearing stress in each of the support brackets at $B$.

SOLUTION

Geometry: Triangle $ABC$ is an isoseles triangle with angles shown here.

Use joint A as a free body.

Law of sines applied to force triangle

\[
\frac{P}{\sin 20^\circ} = \frac{F_{AB}}{\sin 110^\circ} = \frac{F_{AC}}{\sin 50^\circ}
\]

\[
F_{AB} = \frac{P \sin 110^\circ}{\sin 20^\circ} = \frac{(9) \sin 110^\circ}{\sin 20^\circ} = 24.73 \text{ kN}
\]
PROBLEM 1.24 (Continued)

(a) Allowable pin diameter.

\[ \tau = \frac{F_{AB}}{2A_p} = \frac{F_{AB}}{2 \frac{\pi}{4} d^2} = \frac{2F_{AB}}{\pi d^2} \]

where \( F_{AB} = 24.73 \times 10^3 \) N

\[ d^2 = \frac{2F_{AB}}{\pi \tau} = \frac{(2)(24.73 \times 10^3)}{\pi(120 \times 10^6)} = 131.18 \times 10^{-6} \text{m}^2 \]

\[ d = 11.45 \times 10^{-3} \text{m} \quad 11.45 \text{ mm} \]

(b) Bearing stress in \( AB \) at \( A \).

\[ A_b = td = (0.016)(11.45 \times 10^{-3}) = 183.26 \times 10^{-6} \text{m}^2 \]

\[ \sigma_b = \frac{F_{AB}}{A_b} = \frac{24.73 \times 10^3}{183.26 \times 10^{-6}} = 134.9 \times 10^6 \quad 134.9 \text{ MPa} \]

(c) Bearing stress in support brackets at \( B \).

\[ A = td = (0.012)(11.45 \times 10^{-3}) = 137.4 \times 10^{-6} \text{m}^2 \]

\[ \sigma_b = \frac{\frac{1}{2} F_{AB}}{A} = \frac{(0.5)(24.73 \times 10^3)}{137.4 \times 10^{-6}} = 90.0 \times 10^6 \quad 90.0 \text{ MPa} \]
PROBLEM 1.25

Determine the largest load $P$ which may be applied at $A$ when $\theta = 60^\circ$, knowing that the average shearing stress in the 10-mm-diameter pin at $B$ must not exceed 120 MPa and that the average bearing stress in member $AB$ and in the bracket at $B$ must not exceed 90 MPa.

SOLUTION

Geometry: Triangle $ABC$ is an isosceles triangle with angles shown here.

Law of sines applied to force triangle

\[
\frac{P}{\sin 30^\circ} = \frac{F_{AB}}{\sin 120^\circ} = \frac{F_{AC}}{\sin 30^\circ}
\]

\[
P = \frac{F_{AB} \sin 30^\circ}{\sin 120^\circ} = 0.57735 \times F_{AB}
\]

\[
P = \frac{F_{AC} \sin 30^\circ}{\sin 30^\circ} = F_{AC}
\]
PROBLEM 1.25 (Continued)

If shearing stress in pin at B is critical,

\[
A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(0.010)^2 = 78.54 \times 10^{-6} \text{ m}^2
\]

\[
F_{AB} = 2A\tau = (2)(78.54 \times 10^{-6})(120 \times 10^6) = 18.850 \times 10^3 \text{ N}
\]

If bearing stress in member AB at bracket at A is critical,

\[
A_b = td = (0.016)(0.010) = 160 \times 10^{-6} \text{ m}^2
\]

\[
F_{AB} = A_b\sigma_b = (160 \times 10^{-6})(90 \times 10^6) = 14.40 \times 10^3 \text{ N}
\]

If bearing stress in the bracket at B is critical,

\[
A_b = 2td = (2)(0.012)(0.010) = 240 \times 10^{-6} \text{ m}^2
\]

\[
F_{AB} = A_b\sigma_b = (240 \times 10^{-6})(90 \times 10^6) = 21.6 \times 10^3 \text{ N}
\]

Allowable \( F_{AB} \) is the smallest, i.e., 14.40 \( \times 10^3 \text{ N} \)

Then from Statics

\[
P_{\text{allow}} = (0.57735)(14.40 \times 10^3)
\]

\[
= 8.31 \times 10^3 \text{ N}
\]

\[
\therefore 8.31 \text{ kN}

PROBLEM 1.26

Link $AB$, of width $b = 50$ mm and thickness $t = 6$ mm, is used to support the end of a horizontal beam. Knowing that the average normal stress in the link is $-140$ MPa, and that the average shearing stress in each of the two pins is $80$ MPa, determine (a) the diameter $d$ of the pins, (b) the average bearing stress in the link.

SOLUTION

Rod $AB$ is in compression.

$$ A = bt \quad \text{where} \quad b = 50 \text{ mm} \quad \text{and} \quad t = 6 \text{ mm} $$

$$ A = (0.050)(0.006) = 300 \times 10^{-6} \text{ m}^2 $$

$$ P = -\sigma A = -(140 \times 10^6)(300 \times 10^{-6}) $$

$$ = 42 \times 10^3 \text{ N} $$

For the pin,

$$ A_p = \frac{\pi d^2}{4} \quad \text{and} \quad \tau = \frac{P}{A_p} $$

$$ A_p = \frac{P}{\tau} = \frac{42 \times 10^3}{80 \times 10^6} = 525 \times 10^{-6} \text{ m}^2 $$

(a) Diameter $d$

$$ d = \sqrt{\frac{4A_p}{\pi}} = \sqrt{\frac{(4)(525 \times 10^{-6})}{\pi}} = 2.585 \times 10^{-3} \text{ m} \quad d = 25.9 \text{ mm} $$

(b) Bearing stress

$$ \sigma_b = \frac{P}{dt} = \frac{42 \times 10^3}{(25.85 \times 10^{-3})(0.006)} = 271 \times 10^6 \text{ Pa} \quad \sigma_b = 271 \text{ MPa} $$

SOLUTION
Use bar ABC as a free body.

\[ \sum M_C = 0 : \quad (0.040)F_{BD} - (0.025 + 0.040)(20 \times 10^3) = 0 \]

\[ F_{BD} = 32.5 \times 10^3 \text{N} \]

(a) Shear pin at B

\[ \tau = \frac{F_{BD}}{2A} \text{ for double shear,} \]

where

\[ A = \frac{\pi}{4} d^2 = \frac{\pi}{4} (0.016)^2 = 201.06 \times 10^{-6} \text{m}^2 \]

\[ \tau = \frac{32.5 \times 10^3}{(2)(201.06 \times 10^{-6})} = 80.8 \times 10^6 \]

\[ \tau = 80.8 \text{ MPa} \]

(b) Bearing: link BD

\[ A = dt = (0.016)(0.008) = 128 \times 10^{-6} \text{m}^2 \]

\[ \sigma_b = \frac{\frac{1}{2}F_{BD}}{A} = \frac{(0.5)(32.5 \times 10^3)}{128 \times 10^{-6}} = 126.95 \times 10^6 \]

\[ \sigma_b = 127.0 \text{ MPa} \]

(c) Bearing in ABC at B

\[ A = dt = (0.016)(0.010) = 160 \times 10^{-6} \text{m}^2 \]

\[ \sigma_b = \frac{F_{BD}}{A} = \frac{32.5 \times 10^3}{160 \times 10^{-6}} = 203 \times 10^6 \]

\[ \sigma_b = 203 \text{ MPa} \]
PROBLEM 1.28

The hydraulic cylinder \( Cf \), which partially controls the position of rod \( De \), has been locked in the position shown. Member \( Bd \) is \( \frac{5}{8} \) in. thick and is connected to the vertical rod by a \( \frac{3}{8} \)-in.-diameter bolt. Determine (a) the average shearing stress in the bolt, (b) the bearing stress at \( C \) in member \( Bd \).

SOLUTION

Use member \( BCD \) as a free body, and note that \( AB \) is a two force member.

\[
I_{AB} = \sqrt{8^2 + 1.8^2} = 8.2 \text{ in.}
\]

\[

\]

\[
3.36678 F_{AB} - 2789.35 = 0 \quad \therefore F_{AB} = 828.49 \text{ lb}
\]

\[
\sum F_x = 0: \quad -\frac{1.8}{8.2} F_{AB} + C_x + 400 \cos 75^\circ = 0
\]

\[
C_x = \frac{(1.8)(828.49)}{8.2} - 400 \cos 75^\circ = 78.34 \text{ lb}
\]

\[
\sum F_y = 0: \quad -\frac{8}{8.2} F_{AB} + C_y - 400 \sin 75^\circ = 0
\]

\[
C_y = \frac{(8)(828.49)}{8.2} + 400 \sin 75^\circ = 1194.65 \text{ lb}

\[
C = \sqrt{C_x^2 + C_y^2} = 1197.2 \text{ lb}

(b) Bearing stress at \( C \) in member \( BCD \): \( P = 1197.2 \text{ lb} \)

\[

**SOLUTION**

\[ A_0 = (5.0)(3.0) = 15 \text{ in}^2 \]
\[ \theta = 90^\circ - 60^\circ = 30^\circ \]
\[ \sigma = \frac{P \cos^2 \theta}{A_0} \]

(a)
\[ P = \frac{\sigma A_0}{\cos^2 \theta} = \frac{(75)(15)}{\cos^2 30^\circ} = 1500 \text{ lb} \]

PROBLEM 1.31

Two wooden members of uniform rectangular cross section are joined by the simple glued scarf splice shown. Knowing that \( P = 11 \text{ kN} \), determine the normal and shearing stresses in the glued splice.

SOLUTION

\[ \theta = 90^\circ - 45^\circ = 45^\circ \]
\[ P = 11 \text{ kN} = 11 \times 10^3 \text{ N} \]
\[ A_0 = (150)(75) = 11.25 \times 10^3 \text{ mm}^2 = 11.25 \times 10^{-3} \text{ m}^2 \]
\[ \sigma = \frac{P \cos^2 \theta}{A_0} = \frac{(11 \times 10^3) \cos^2 45^\circ}{11.25 \times 10^{-3}} = 489 \times 10^3 \text{ Pa} \]
\[ \sigma = 489 \text{ kPa} \]  
\[ \tau = \frac{P \sin 2\theta}{2A_0} = \frac{(11 \times 10^3)(\sin 90^\circ)}{2(11.25 \times 10^{-3})} = 489 \times 10^3 \text{ Pa} \]
\[ \tau = 489 \text{ kPa} \]
PROBLEM 1.32

Two wooden members of uniform rectangular cross section are joined by the simple glued scarf splice shown. Knowing that the maximum allowable shearing stress in the glued splice is 620 kPa, determine (a) the largest load $P$ that can be safely applied, (b) the corresponding tensile stress in the splice.

SOLUTION

\[
\theta = 90^\circ - 45^\circ = 45^\circ \\
A_0 = (150)(75) = 11.25 \times 10^3 \text{mm}^2 = 11.25 \times 10^{-3} \text{m}^2 \\
\tau = 620 \text{ kPa} = 620 \times 10^3 \text{Pa} \\

(a) $P = \frac{2A_0\tau}{\sin 2\theta} = \frac{(2)(11.25 \times 10^{-3})(620 \times 10^3)}{\sin 90^\circ}$ 

\[= 13.95 \times 10^3 \text{N} \quad P = 13.95 \text{ kN} \uparrow\]

(b) $\sigma = \frac{P \cos^2 \theta}{A_0} = \frac{(13.95 \times 10^3)(\cos 45^\circ)^2}{11.25 \times 10^{-3}}$

\[= 620 \times 10^3 \text{Pa} \quad \sigma = 620 \text{ kPa} \uparrow\]
PROBLEM 1.33

A steel pipe of 12-in. outer diameter is fabricated from \( \frac{1}{4} \)-in.-thick plate by welding along a helix that forms an angle of 25° with a plane perpendicular to the axis of the pipe. Knowing that the maximum allowable normal and shearing stresses in the directions respectively normal and tangential to the weld are \( \sigma = 12 \text{ ksi} \) and \( \tau = 7.2 \text{ ksi} \), determine the magnitude \( P \) of the largest axial force that can be applied to the pipe.

SOLUTION

\[
d_o = 12 \text{ in.} \quad r_o = \frac{1}{2} d_o = 6 \text{ in.} \\
r_i = r_o - t = 6 - 0.25 = 5.75 \text{ in.} \\
A_0 = \pi (r_o^2 - r_i^2) = \pi (6^2 - 5.75^2) = 9.228 \text{ in}^2 \\
\theta = 25^\circ
\]

Based on \( |\sigma| = 12 \text{ ksi} \):

\[
\sigma = \frac{P}{A_0} \cos^2 \theta \\
\sigma = \frac{P}{9.228} \cos^2 25^\circ = \frac{(9.228)(12 \times 10^3)}{\cos^2 25^\circ} = 134.8 \times 10^3 \text{ lb}
\]

Based on \( |\tau| = 7.2 \text{ ksi} \):

\[
\tau = \frac{P}{2A_0} \sin 2\theta \\
\tau = \frac{P}{2 \times 9.228} \sin 2 \times 25^\circ = \frac{(2)(9.288)(7.2 \times 10^3)}{\sin 50^\circ} = 174.5 \times 10^3 \text{ lb}

P = 134.8 \times 10^3 \text{ lb} \\
P = 134.8 \text{ kips}

Knowing that a 66 kip axial force $P$ is applied to the pipe, determine the normal and shearing stresses in directions respectively normal and tangential to the weld.

SOLUTION

\[ d_o = 12 \text{ in.} \quad r_o = \frac{1}{2} d_o = 6 \text{ in.} \]
\[ r_i = r_o - t = 6 - 0.25 = 5.75 \text{ in.} \]
\[ A_0 = \pi (r_o^2 - r_i^2) = \pi (6^2 - 5.75^2) = 9.228 \text{ in}^2 \]
\[ \theta = 25^\circ \]

Normal stress:
\[ \sigma = \frac{P \cos^2 \theta}{A_0} = \frac{(66 \times 10^3) \cos^2 25^\circ}{9.228} = 5875 \text{ psi} \]
\[ \sigma = 5.87 \text{ ksi} \]

Shearing stress:
\[ \tau = \frac{P \sin 2\theta}{2A_0} = \frac{(66 \times 10^3) \sin 50^\circ}{(2)(9.228)} = 2739 \text{ psi} \]

\[ \sigma = 18.00 \text{ MPa} \]

(d) **Maximum normal stress:**

\[ \sigma_{\text{max}} = \frac{P}{A_0} \]

\[ \sigma_{\text{max}} = \frac{705.8 \times 10^3}{19.6 \times 10^{-3}} = 36.0 \times 10^6 \text{ Pa} \]

\[ \sigma_{\text{max}} = 36.0 \text{ MPa (compression)} \]
PROBLEM 1.37

Link $BC$ is 6 mm thick, has a width $w = 25$ mm, and is made of a steel with a 480-MPa ultimate strength in tension. What was the safety factor used if the structure shown was designed to support a 16-kN load $P$?

SOLUTION

Use bar $ACD$ as a free body and note that member $BC$ is a two-force member.

\[ \Sigma M_A = 0: \]
\[ (480)F_{BC} - (600)P = 0 \]
\[ F_{BC} = \frac{600}{480} \times P = \left(\frac{600}{480}\right)(16 \times 10^3) = 20 \times 10^3 \, \text{N} \]

Ultimate load for member $BC$:
\[ F_U = \sigma_U A \]
\[ F_U = (480 \times 10^6)(0.006)(0.025) = 72 \times 10^3 \, \text{N} \]

Factor of safety:
\[ \text{FS.} = \frac{F_U}{F_{BC}} = \frac{72 \times 10^3}{20 \times 10^3} \]
\[ \text{FS.} = 3.60 \]

PROBLEM 1.38

Link BC is 6 mm thick and is made of a steel with a 450-MPa ultimate strength in tension. What should be its width $w$ if the structure shown is being designed to support a 20-kN load $P$ with a factor of safety of 3?

SOLUTION

Use bar $ACD$ as a free body and note that member $BC$ is a two-force member.

$\Sigma M_A = 0$:

$$(480)F_{BC} - 600P = 0$$

$$F_{BC} = \frac{600P}{480} = \frac{(600)(20 \times 10^3)}{480} = 25 \times 10^3 \text{N}$$

For a factor of safety F.S. = 3, the ultimate load of member $BC$ is

$$F_U = (\text{F.S.})(F_{BC}) = (3)(25 \times 10^3) = 75 \times 10^3 \text{N}$$

But $F_U = \sigma_U A$  $\therefore A = \frac{F_U}{\sigma_U} = \frac{75 \times 10^3}{450 \times 10^6} = 166.67 \times 10^{-6} \text{m}^2$

For a rectangular section $A = wt$ or $w = \frac{A}{t} = \frac{166.67 \times 10^{-6}}{0.006}$

$$w = 27.8 \times 10^{-3} \text{m or 27.8 mm}$$
PROBLEM 1.39

A \( \frac{3}{4} \)-in.-diameter rod made of the same material as rods \( AC \) and \( AD \) in the truss shown was tested to failure and an ultimate load of 29 kips was recorded. Using a factor of safety of 3.0, determine the required diameter (a) of rod \( AC \), (b) of rod \( AD \).

SOLUTION

Forces in \( AC \) and \( AD \).

Joint \( C \):

\[ + \sum F_y = 0: \quad \frac{1}{\sqrt{5}} F_{AC} - 10 \text{ kips} = 0 \]

\[ F_{AC} = 22.36 \text{ kips T} \]

Joint \( D \):

\[ + \sum F_y = 0: \quad \frac{1}{\sqrt{17}} F_{AD} - 10 \text{ kips} = 0 \]

\[ F_{AD} = 41.23 \text{ kips T} \]

Ultimate stress. From test on \( \frac{3}{4} \)-in. rod:

\[ \sigma_U = \frac{P_U}{A} = \frac{29 \text{ kips}}{\frac{\pi}{4}(\frac{3}{4})^2} = 65.64 \text{ ksi} \]

Allowable stress:

\[ \sigma_{all} = \frac{\sigma_U}{F.S.} = \frac{65.64 \text{ ksi}}{3.0} = 21.88 \text{ ksi} \]

(a) Diameter of rod \( AC \).

\[ \sigma_{all} = \frac{F_{AC}}{\frac{4}{\pi}d^2} \quad d^2 = \frac{4F_{AC}}{\pi \sigma_{all}} = \frac{4(22.36)}{\pi(21.88)} = 1.301 \quad d = 1.141 \text{ in.} \]

(b) Diameter of rod \( AD \).

\[ d^2 = \frac{4F_{AD}}{\pi \sigma_{all}} = \frac{4(41.23)}{\pi(21.88)} = 2.399 \quad d = 1.549 \text{ in.} \]
**PROBLEM 1.40**

In the truss shown, members $AC$ and $AD$ consist of rods made of the same metal alloy. Knowing that $AC$ is of 1-in. diameter and that the ultimate load for that rod is 75 kips, determine $(a)$ the factor of safety for $AC$, $(b)$ the required diameter of $AD$ if it is desired that both rods have the same factor of safety.

**SOLUTION**

Forces in $AC$ and $AD$.

Joint C:

\[ \Sigma F_y = 0: \quad \frac{1}{\sqrt{5}} F_{AC} - 10 \text{ kips} = 0 \]

\[ F_{AC} = 22.36 \text{ kips} \quad T \]

Joint D:

\[ \Sigma F_y = 0: \quad \frac{1}{\sqrt{17}} F_{AD} - 10 \text{ kips} = 0 \]

\[ F_{AD} = 41.23 \text{ kips} \quad T \]

$(a)$ Factor of safety for $AC$.

\[ \text{F.S.} = \frac{P_u}{F_{AC}} \quad \text{F.S.} = \frac{75 \text{ kips}}{22.36 \text{ kips}} \quad \text{F.S.} = 3.35 \]

$(b)$ For the same factor of safety in $AC$ and $AD$, $\sigma_{AD} = \sigma_{AC}$.

\[ \frac{F_{AD}}{A_{AD}} = \frac{F_{AC}}{A_{AC}} \]

\[ A_{AD} = \frac{F_{AD}}{F_{AC}} A_{AC} = \frac{41.23 \pi (1)^2}{22.36 \pi} = 1.4482 \text{ in}^2 \]

Required diameter:

\[ d_{AD} = \sqrt{ \frac{A_{AD}}{\pi} } = \sqrt{ \frac{(4)(1.4482)}{\pi} } \quad d_{AD} = 1.358 \text{ in} \]
PROBLEM 1.41

Link $AB$ is to be made of a steel for which the ultimate normal stress is 450 MPa. Determine the cross-sectional area for $AB$ for which the factor of safety will be 3.50. Assume that the link will be adequately reinforced around the pins at $A$ and $B$.

SOLUTION

$P = (1.2)(8) = 9.6 \text{kN}$

$\sum M_D = 0 : \quad -(0.8)(F_{AB}\sin 35^\circ) + (0.2)(9.6) + (0.4)(20) = 0$

$F_{AB} = 21.619 \text{kN} = 21.619 \times 10^3 \text{N}$

$\sigma_{AB} = \frac{F_{AB}}{A_{AB}} = \frac{\sigma_{ult}}{F.S.}$

$A_{AB} = \frac{(F.S.)F_{AB}}{\sigma_{ult}} = \frac{(3.50)(21.619 \times 10^3)}{450 \times 10^6}$

$= 168.1 \times 10^{-6} \text{m}^2$

$A_{AB} = 168.1 \text{mm}^2$
**PROBLEM 1.42**

A steel loop $ABCD$ of length 1.2 m and of 10-mm diameter is placed as shown around a 24-mm-diameter aluminum rod $AC$. Cables $BE$ and $DF$, each of 12-mm diameter, are used to apply the load $Q$. Knowing that the ultimate strength of the steel used for the loop and the cables is 480 MPa and that the ultimate strength of the aluminum used for the rod is 260 MPa, determine the largest load $Q$ that can be applied if an overall factor of safety of 3 is desired.

**SOLUTION**

Using joint $B$ as a free body and considering symmetry,

$$2 \cdot \frac{3}{5} F_{AB} - Q = 0 \quad Q = \frac{6}{5} F_{AB}$$

Using joint $A$ as a free body and considering symmetry,

$$2 \cdot \frac{4}{5} F_{AB} - F_{AC} = 0$$

$$\frac{8}{5} \cdot \frac{5}{6} Q - F_{AC} = 0 \quad : \quad Q = \frac{3}{4} F_{AC}$$

Based on strength of cable $BF$:

$$Q_U = \sigma_U A = \sigma_U \frac{\pi}{4} d^2 = (480 \times 10^6) \frac{\pi}{4} (0.012)^2 = 54.29 \times 10^3 \text{N}$$

Based on strength of steel loop:

$$Q_U = \frac{6}{5} F_{AB,U} = \frac{6}{5} \sigma_U A = \frac{6}{5} \sigma_U \frac{\pi}{4} d^2$$

$$= \frac{6}{5} (480 \times 10^6) \frac{\pi}{4} (0.010)^2 = 45.24 \times 10^3 \text{N}$$

Based on strength of rod $AC$:

$$Q_U = \frac{3}{4} F_{AC,U} = \frac{3}{4} \sigma_U A = \frac{3}{4} \sigma_U \frac{\pi}{4} d^2 = \frac{3}{4} (260 \times 10^6) \frac{\pi}{4} (0.024)^2 = 88.22 \times 10^3 \text{N}$$

Actual ultimate load $Q_U$ is the smallest, : $Q_U = 45.24 \times 10^3 \text{N}$

Allowable load:

$$Q = \frac{Q_U}{F.S.} = \frac{45.24 \times 10^3}{3} = 15.08 \times 10^3 \text{N} \quad Q = 15.08 \text{kN} \blacktriangleleft$$
**PROBLEM 1.43**

Two wooden members shown, which support a 3.6 kip load, are joined by plywood splices fully glued on the surfaces in contact. The ultimate shearing stress in the glue is 360 psi and the clearance between the members is $\frac{1}{4}$ in. Determine the required length $L$ of each splice if a factor of safety of 2.75 is to be achieved.

**SOLUTION**

There are 4 separate areas of glue. Let $l$ be the length of each area and $w = 5$ in. its width. Then the area is $A = lw$.

Each glue area transmits one half of the total load.

$$F = \left(\frac{1}{2}\right)(3.6 \text{ kips}) = 1.8 \text{ kips}$$

Required ultimate load for each glue area:

$$F_U = (F.S.) F = (2.75)(1.8) = 4.95 \text{ kips}$$

Required length of each glue area:

$$l = \frac{F_U}{\tau_U w} = \frac{4.95 \times 10^3}{(360)(5)} = 2.75 \text{ in.}$$

Total length of splice:

$$L = l + \frac{1}{4} \text{ in.} + l$$

$$L = 2.75 + 0.25 + 2.75$$

$$L = 5.75 \text{ in.}$$
**PROBLEM 1.44**

Two plates, each $\frac{1}{8}$ in. thick, are used to splice a plastic strip as shown. Knowing that the ultimate shearing stress of the bonding between the surface is 130 psi, determine the factor of safety with respect to shear when $P = 325$ lb.

**SOLUTION**

Bond area: (See figure)

$$A = \frac{1}{2}(2.25)(0.75) + (2.25)(0.625) = 2.25 \text{ in}^2$$

$$P_U = 2A\tau_U = (2)(2.25)(130) = 585 \text{ lb.}$$

$$F.S. = \frac{P_U}{P} = \frac{585}{325} = 1.800$$
PROBLEM 1.45

A load $P$ is supported as shown by a steel pin that has been inserted in a short wooden member hanging from the ceiling. The ultimate strength of the wood used is 60 MPa in tension and 7.5 MPa in shear, while the ultimate strength of the steel is 145 MPa in shear. Knowing that $b = 40$ mm, $c = 55$ mm, and $d = 12$ mm, determine the load $P$ if an overall factor of safety of 3.2 is desired.

SOLUTION

Based on double shear in pin:

$$P_U = 2A	au_U = 2\frac{\pi}{4}d^2\tau_U$$

$$= \frac{\pi}{4}(2)(0.012)^2(145 \times 10^6) = 32.80 \times 10^3 \text{N}$$

Based on tension in wood:

$$P_U = A\sigma_U = w(b - d)\sigma_U$$

$$= (0.040)(0.040 - 0.012)(60 \times 10^6)$$

$$= 67.2 \times 10^3 \text{N}$$

Based on double shear in the wood:

$$P_U = 2A	au_U = 2wc\tau_U = (2)(0.040)(0.055)(7.5 \times 10^6)$$

$$= 33.0 \times 10^3 \text{N}$$

Use smallest $P_U = 32.8 \times 10^3 \text{N}$

Allowable:

$$P = \frac{P_U}{F.S.} = \frac{32.8 \times 10^3}{3.2} = 10.25 \times 10^3 \text{N}$$

$10.25 \text{kN}$
PROBLEM 1.46

For the support of Prob. 1.45, knowing that the diameter of the pin is \( d = 16 \text{ mm} \) and that the magnitude of the load is \( P = 20 \text{ kN} \), determine (a) the factor of safety for the pin, (b) the required values of \( b \) and \( c \) if the factor of safety for the wooden members is the same as that found in part \( a \) for the pin.

PROBLEM 1.45 A load \( P \) is supported as shown by a steel pin that has been inserted in a short wooden member hanging from the ceiling. The ultimate strength of the wood used is 60 MPa in tension and 7.5 MPa in shear, while the ultimate strength of the steel is 145 MPa in shear. Knowing that \( b = 40 \text{ mm} \), \( c = 55 \text{ mm} \), and \( d = 12 \text{ mm} \), determine the load \( P \) if an overall factor of safety of 3.2 is desired.

SOLUTION

\( P = 20 \text{kN} = 20 \times 10^3 \text{N} \)

(a) Pin:

\[ A = \frac{\pi}{4} d^2 = \frac{\pi}{4} (0.016)^2 = 2.016 \times 10^{-6} \text{m}^2 \]

Double shear:

\[ \tau = \frac{P}{2A}, \quad \tau_U = \frac{P_U}{2A} \]

\[ P_U = 2A\tau_U = (2)(201.16 \times 10^{-6})(145 \times 10^6) = 58.336 \times 10^3 \text{N} \]

\[ F.S. = \frac{P_U}{P} = \frac{58.336 \times 10^3}{20 \times 10^3} = 2.92 \]

(b) Tension in wood:

\[ P_U = 58.336 \times 10^3 \text{N} \text{ for same F.S.} \]

\[ \sigma_U = \frac{P_U}{A} = \frac{P_U}{w(b - d)} \text{ where } w = 40 \text{ mm} = 0.040 \text{ m} \]

\[ b = d + \frac{P_U}{w\sigma_U} = 0.016 + \frac{58.336 \times 10^3}{(0.040)(60 \times 10^6)} = 40.3 \times 10^{-3} \text{ m} \]

\( b = 40.3 \text{ mm} \)

Shear in wood:

\[ P_U = 58.336 \times 10^3 \text{N} \text{ for same F.S.} \]

Double shear; each area is \( A = wc \)

\[ \tau_U = \frac{P_U}{2A} = \frac{P_U}{2wc} \]

\[ c = \frac{P_U}{2w\tau_U} = \frac{58.336 \times 10^3}{(2)(0.040)(7.5 \times 10^6)} = 97.2 \times 10^{-3} \text{ m} \]

\( c = 97.2 \text{ mm} \)
PROBLEM 1.47

Three steel bolts are to be used to attach the steel plate shown to a wooden beam. Knowing that the plate will support a 110-kN load, that the ultimate shearing stress for the steel used is 360 MPa, and that a factor of safety of 3.35 is desired, determine the required diameter of the bolts.

SOLUTION

For each bolt, 

\[ P = \frac{110}{3} = 36.667 \text{ kN} \]

Required: 

\[ P_U = (F.S.)P = (3.35)(36.667) = 122.83 \text{ kN} \]

\[ \tau_U = \frac{P_U}{A} = \frac{P_U}{\frac{\pi}{4}d^2} = \frac{4P_U}{\pi d^2} \]

\[ d = \sqrt[4]{\frac{4P_U}{\pi \tau_U}} = \sqrt[4]{\frac{(4)(122.83 \times 10^3)}{\pi(360 \times 10^6)}} = 20.8 \times 10^{-3} \text{ m} \]

\[ d = 20.8 \text{ mm} \]
**PROBLEM 1.48**

Three 18-mm-diameter steel bolts are to be used to attach the steel plate shown to a wooden beam. Knowing that the plate will support a 110-kN load and that the ultimate shearing stress for the steel used is 360 MPa, determine the factor of safety for this design.

**SOLUTION**

For each bolt, 

\[ A = \frac{\pi d^2}{4} = \frac{\pi}{4}(18)^2 = 254.47 \text{ mm}^2 = 254.47 \times 10^{-6} \text{ m}^2 \]

\[ P_U = A\tau_U = (254.47 \times 10^{-6})(360 \times 10^6) \]

\[ = 91.609 \times 10^3 \text{ N} \]

For the three bolts, 

\[ P_U = (3)(91.609 \times 10^3) = 274.83 \times 10^3 \text{ N} \]

Factor of safety:

\[ F.S. = \frac{P_U}{P} = \frac{274.83 \times 10^3}{110 \times 10^3} \]

\[ F.S. = 2.50 \]

PROBLEM 1.49

A steel plate $\frac{5}{16}$ in. thick is embedded in a horizontal concrete slab and is used to anchor a high-strength vertical cable as shown. The diameter of the hole in the plate is $\frac{3}{4}$ in., the ultimate strength of the steel used is 36 ksi, and the ultimate bonding stress between plate and concrete is 300 psi. Knowing that a factor of safety of 3.60 is desired when $P = 2.5$ kips, determine (a) the required width $a$ of the plate, (b) the minimum depth $b$ to which a plate of that width should be embedded in the concrete slab. (Neglect the normal stresses between the concrete and the lower end of the plate.)

SOLUTION

Based on tension in plate:

\[ P = \sigma_U A \]
\[ F.S. = \frac{P_U}{P} = \frac{\sigma_U (a - d)t}{P} \]

Solving for $a$,

\[ a = d + \frac{F.S. P}{\sigma_U t} = \frac{3}{4} + \frac{(3.6)(2.5)}{(36)(\frac{5}{16})} \]

(a) $a = 1.550$ in.

Based on shear between plate and concrete slab,

\[ A = \text{perimeter} \times \text{depth} = 2(a + t)b \quad \tau_U = 0.300 \text{ ksi} \]
\[ P_U = \tau_U A = 2\tau_U (a + t)b \quad F.S. = \frac{P_U}{P} \]

Solving for $b$,

\[ b = \frac{F.S. P}{2(a + t)\tau_U} = \frac{(3.6)(2.5)}{(2)(1.550 + \frac{5}{16})(0.300)} \]

(b) $b = 8.05$ in.
PROBLEM 1.50

Determine the factor of safety for the cable anchor in Prob. 1.49 when \( P = 3 \) kips, knowing that \( a = 2 \) in. and \( b = 7.5 \) in.

PROBLEM 1.49 A steel plate \( \frac{5}{16} \) in. thick is embedded in a horizontal concrete slab and is used to anchor a high-strength vertical cable as shown. The diameter of the hole in the plate is \( \frac{3}{4} \) in., the ultimate strength of the steel used is 36 ksi, and the ultimate bonding stress between plate and concrete is 300 psi. Knowing that a factor of safety of 3.60 is desired when \( P = 2.5 \) kips, determine \( a \) the required width of the plate, \( b \) the minimum depth to which a plate of that width should be embedded in the concrete slab. (Neglect the normal stresses between the concrete and the lower end of the plate.)

SOLUTION

Based on tension in plate:

\[
A = (a - d)t = \left(2 - \frac{3}{4}\right)\left(\frac{5}{16}\right) = 0.3906 \text{ in}^2
\]

\[
P_U = \sigma_U A = (36)(0.3906) = 14.06 \text{ kips}
\]

\[
F.S. = \frac{P_U}{P} = \frac{14.06}{3} = 4.69
\]

Based on shear between plate and concrete slab:

\[
A = \text{perimeter \times depth} = 2(a + t)b = 2\left(2 + \frac{5}{16}\right)(7.5)
\]

\[
A = 34.69 \text{ in}^2 \quad \tau_U = 0.300 \text{ ksi}
\]

\[
P_U = \tau_U A = (0.300)(34.69) = 10.41 \text{ kips}
\]

\[
F.S. = \frac{P_U}{P} = \frac{10.41}{3} = 3.47
\]

Actual factor of safety is the smaller value. \( F.S. = 3.47 \)
PROBLEM 1.51

In the steel structure shown, a 6-mm-diameter pin is used at C and 10-mm-diameter pins are used at B and D. The ultimate shearing stress is 150 MPa at all connections, and the ultimate normal stress is 400 MPa in link BD. Knowing that a factor of safety of 3.0 is desired, determine the largest load \( P \) that can be applied at A. Note that link BD is not reinforced around the pin holes.

SOLUTION

Use free body \( ABC \).

\[ \Sigma M_C = 0 : \quad 0.280P - 0.120F_{BD} = 0 \]
\[ P = \frac{3}{7}F_{BD} \quad (1) \]

\[ \Sigma M_B = 0 : \quad 0.160P - 0.120C = 0 \]
\[ P = \frac{3}{4}C \quad (2) \]

Tension on net section of link BD.

\[ F_{BD} = \sigma A_{\text{net}} = \frac{\sigma_U}{F.S.}A_{\text{net}} = \left(\frac{400 \times 10^6}{3}\right)(6 \times 10^{-3})(18 - 10)(10^{-3}) = 6.40 \times 10^3 \text{ N} \]

Shear in pins at B and D.

\[ F_{BD} = \tau A_{\text{pin}} = \frac{\tau_U \pi d^2}{F.S.} = \left(\frac{150 \times 10^6}{3}\right) \left(\frac{\pi}{4}\right)(10 \times 10^{-3})^2 = 3.9270 \times 10^3 \text{ N} \]

Smaller value of \( F_{BD} \) is \( 3.9270 \times 10^3 \text{ N} \).

From (1)

\[ P = \left(\frac{3}{7}\right)(3.9270 \times 10^3) = 1.683 \times 10^3 \text{ N} \]

Shear in pin at C.

\[ C = 2\tau A_{\text{pin}} = 2\frac{\tau_U \pi d^2}{F.S.} = \left(\frac{150 \times 10^6}{3}\right) \left(\frac{\pi}{4}\right)(6 \times 10^{-3})^2 = 2.8274 \times 10^3 \text{ N} \]

From (2)

\[ P = \left(\frac{3}{4}\right)(2.8274 \times 10^3) = 2.12 \times 10^3 \text{ N} \]

Smaller value of \( P \) is allowable value.

\[ P = 1.683 \times 10^3 \text{ N} \]

\[ P = 1.683 \text{ kN} \]
**PROBLEM 1.52**

Solve Prob. 1.51, assuming that the structure has been redesigned to use 12-mm-diameter pins at B and D and no other change has been made.

**PROBLEM 1.51** In the steel structure shown, a 6-mm-diameter pin is used at C and 10-mm-diameter pins are used at B and D. The ultimate shearing stress is 150 MPa at all connections, and the ultimate normal stress is 400 MPa in link BD. Knowing that a factor of safety of 3.0 is desired, determine the largest load \( P \) that can be applied at A. Note that link BD is not reinforced around the pin holes.

**SOLUTION**

Use free body \( ABC \).

**Tension on net section of link BD.**

\[
F_{BD} = \sigma_{net} A_{net} = \frac{\sigma_{U}}{F.S.} A_{net} = \left( \frac{400 \times 10^6}{3} \right) \left( 6 \times 10^{-3} \right) (18 - 12)(10^{-3}) = 4.80 \times 10^3 \text{ N}
\]

**Shear in pins at B and D.**

\[
F_{BD} = \tau_{pin} = \frac{\tau_{U} \pi d^2}{F.S. 4} = \left( \frac{150 \times 10^6}{3} \right) \left( \frac{\pi}{4} \right) (12 \times 10^{-3})^2 = 5.6549 \times 10^3 \text{ N}
\]

Smaller value of \( F_{BD} \) is \( 4.80 \times 10^3 \text{ N} \).

From (1),

\[
P = \left( \frac{3}{7} \right) (4.80 \times 10^3) = 2.06 \times 10^3 \text{ N}

**Shear in pin at C.**

\[
C = 2\tau_{pin} = 2 \frac{\tau_{U} \pi d^2}{F.S. 4} = \left( \frac{150 \times 10^6}{3} \right) \left( \frac{\pi}{4} \right) (6 \times 10^{-3})^2 = 2.8274 \times 10^3 \text{ N}
\]

From (2),

\[
P = \left( \frac{3}{4} \right) (2.8274 \times 10^3) = 2.12 \times 10^3 \text{ N}
\]

Smaller value of \( P \) is the allowable value. \( P = 2.06 \times 10^3 \text{ N} \)

\( P = 2.06 \text{ kN} \)
PROBLEM 1.53

Each of the two vertical links $CF$ connecting the two horizontal members $AD$ and $EG$ has a uniform rectangular cross section $\frac{1}{4}$ in. thick and 1 in. wide, and is made of a steel with an ultimate strength in tension of 60 ksi. The pins at $C$ and $F$ each have a $\frac{1}{2}$-in. diameter and are made of a steel with an ultimate strength in shear of 25 ksi. Determine the overall factor of safety for the links $CF$ and the pins connecting them to the horizontal members.

SOLUTION

Use member EFG as free body.

\[ \sum M_E = 0 : \quad 16F_{CF} - (26)(2) = 0 \]
\[ F_{CF} = 3.25 \text{ kips} \]

Failure by tension in links $CF$. (2 parallel links)

Net section area for 1 link: \( A = (b - d)t = (1 - \frac{1}{2})(\frac{1}{4}) = 0.125 \text{ in}^2 \)
\[ F_U = 2A\sigma_U = (2)(0.125)(60) = 15 \text{ kips} \]

Failure by double shear in pins.

\[ A = \frac{\pi d^2}{4} = \frac{\pi \left( \frac{1}{2} \right)^2}{4} = 0.196350 \text{ in}^2 \]
\[ F_U = 2A\tau_U = (2)(0.196350)(25) = 9.8175 \text{ kips} \]

Actual ultimate load is the smaller value. \( F_U = 9.8175 \text{ kips} \)

Factor of safety:

\[ F.S. = \frac{F_U}{F_{CF}} = \frac{9.8175}{3.25} \]
\[ F.S. = 3.02 \]
PROBLEM 1.54

Solve Prob. 1.53, assuming that the pins at C and F have been replaced by pins with a $\frac{3}{4}$-in diameter.

PROBLEM 1.53 Each of the two vertical links CF connecting the two horizontal members AD and EG has a uniform rectangular cross section $\frac{1}{4}$ in. thick and 1 in. wide, and is made of a steel with an ultimate strength in tension of 60 ksi. SOLUTION

Use member EFG as free body.

\[ F_{CF} = 3.25 \text{ kips} \]

Failure by tension in links CF. (2 parallel links)

Net section area for 1 link:
\[ A = (b - d)t = (1 - \frac{3}{4})(\frac{1}{4}) = 0.0625 \text{ in}^2 \]
\[ F_U = 2A\sigma_U = (2)(0.0625)(60) = 7.5 \text{ kips} \]

Failure by double shear in pins.
\[ A = \frac{\pi}{4}d^2 = \frac{\pi}{4} \left(\frac{3}{4}\right)^2 = 0.44179 \text{ in}^2 \]
\[ F_U = 2A\tau_U = (2)(0.44179)(25) = 22.09 \text{ kips} \]

Actual ultimate load is the smaller value. $F_U = 7.5$ kips

Factor of safety:
\[ F.S. = \frac{F_U}{F_{CF}} = \frac{7.5}{3.25} \]
\[ F.S. = 2.31 \]
PROBLEM 1.55

In the structure shown, an 8-mm-diameter pin is used at \(A\), and 12-mm-diameter pins are used at \(B\) and \(D\). Knowing that the ultimate shearing stress is 100 MPa at all connections and that the ultimate normal stress is 250 MPa in each of the two links joining \(B\) and \(D\), determine the allowable load \(P\) if an overall factor of safety of 3.0 is desired.

SOLUTION

Statics: Use \(ABC\) as free body.

\[
\begin{align*}
\sum M_B &= 0: \quad 0.20 F_A - 0.18 P = 0 \\
\therefore F_A &= \frac{9}{10} P \\
\sum M_A &= 0: \quad 0.20 F_{BD} - 0.38 P = 0 \\
\therefore F_{BD} &= \frac{19}{10} P
\end{align*}
\]

Based on double shear in pin \(A\):

\[
F_A = \frac{2\tau_U A}{F.S.} = \frac{(2)(100 \times 10^6)(50.266 \times 10^{-6})}{3.0} = 3.351 \times 10^3 \text{N}
\]

\[
P = \frac{10}{9} F_A = 3.72 \times 10^3 \text{N}
\]

Based on double shear in pins at \(B\) and \(D\):

\[
F_{BD} = \frac{2\tau_U A}{F.S.} = \frac{(2)(100 \times 10^6)(113.10 \times 10^{-6})}{3.0} = 7.54 \times 10^3 \text{N}
\]

\[
P = \frac{10}{19} F_{BD} = 3.97 \times 10^3 \text{N}
\]

Based on compression in links \(BD\): For one link, \(A = (0.020)(0.008) = 160 \times 10^{-6} \text{m}^2\)

\[
F_{BD} = \frac{2\sigma_U A}{F.S.} = \frac{(2)(250 \times 10^6)(160 \times 10^{-6})}{3.0} = 26.7 \times 10^3 \text{N}
\]

\[
P = \frac{10}{19} F_{BD} = 14.04 \times 10^3 \text{N}

Allowable value of \(P\) is smallest, \(\therefore P = 3.72 \times 10^3 \text{N} \quad P = 3.72 \text{kN}\)

PROBLEM 1.57

The Load and Resistance Factor Design method is to be used to select the two cables that will raise and lower a platform supporting two window washers. The platform weighs 160 lb and each of the window washers is assumed to weigh 195 lb with equipment. Since these workers are free to move on the platform, 75% of their total weight and the weight of their equipment will be used as the design live load of each cable. (a) Assuming a resistance factor \( \phi = 0.85 \) and load factors \( \gamma_D = 1.2 \) and \( \gamma_L = 1.5 \), determine the required minimum ultimate load of one cable. (b) What is the conventional factor of safety for the selected cables?

SOLUTION

\[ \gamma_D P_D + \gamma_L P_L = \phi P_U \]

(a) \[ P_U = \frac{\gamma_D P_D + \gamma_L P_L}{\phi} = \frac{(1.2) \left( \frac{1}{2} \times 160 \right) + (1.5) \left( \frac{3}{4} \times 2 \times 195 \right)}{0.85} \]

\[ P_U = 629 \text{ lb} \]

Conventional factor of safety.

\[ P = P_D + P_L = \frac{1}{2} \times 160 + 0.75 \times 2 \times 195 = 372.5 \text{ lb} \]

(b) \[ F.S. = \frac{P_U}{P} = \frac{629}{372.5} \]

\[ F.S. = 1.689 \]
PROBLEM 1.58

A 40-kg platform is attached to the end $B$ of a 50-kg wooden beam $AB$, which is supported as shown by a pin at $A$ and by a slender steel rod $BC$ with a 12-kN ultimate load. (a) Using the Load and Resistance Factor Design method with a resistance factor $\phi = 0.90$ and load factors $\gamma_D = 1.25$ and $\gamma_L = 1.6$, determine the largest load that can be safely placed on the platform. (b) What is the corresponding conventional factor of safety for rod $BC$?

SOLUTION

For dead loading, $W_1 = (40)(9.81) = 392.4 \text{ N}$, $W_2 = (50)(9.81) = 490.5 \text{ N}$

$$P_D = \left(\frac{5}{3}\right)(392.4) + \left(\frac{5}{6}\right)(490.5) = 1.0628 \times 10^3 \text{ N}$$

For live loading, $W_1 = mg$, $W_2 = 0$, $P_L = \frac{5}{3}mg$

From which $m = \frac{3}{5} \frac{P_L}{g}$

Design criterion. $\gamma_D P_D + \gamma_L P_L = \phi P_U$

$$P_L = \frac{\phi P_U - \gamma_D P_D}{\gamma_L} = \frac{(0.90)(12 \times 10^3) - (1.25)(1.0628 \times 10^3)}{1.6}$$

$$= 5.920 \times 10^3 \text{ N}$$

$(a)$ Allowable load. $m = \frac{3}{5} \frac{5.920 \times 10^3}{9.81}$

$m = 362 \text{ kg}$

Conventional factor of safety.

$$P = P_D + P_L = 1.0628 \times 10^3 + 5.920 \times 10^3 = 6.983 \times 10^3 \text{ N}$$

$(b)$ $F.S. = \frac{P_L}{P} = \frac{12 \times 10^3}{6.983 \times 10^3}$

$F.S. = 1.718$
PROBLEM 1.59

A strain gage located at $C$ on the surface of bone $AB$ indicates that the average normal stress in the bone is 3.80 MPa when the bone is subjected to two 1200-N forces as shown. Assuming the cross section of the bone at $C$ to be annular and knowing that its outer diameter is 25 mm, determine the inner diameter of the bone’s cross section at $C$.

SOLUTION

\[
\sigma = \frac{P}{A} \quad \therefore \quad A = \frac{P}{\sigma}
\]

Geometry: \( A = \frac{\pi}{4} (d_i^2 - d_o^2) \)

\[
d_o^2 = d_i^2 - \frac{4A}{\pi} = d_i^2 - \frac{4P}{\pi\sigma}
\]

\[
d_o^2 = (25 \times 10^{-3})^2 - \frac{(4)(1200)}{\pi(3.80 \times 10^6)}
\]

\[
= 222.9 \times 10^{-6} \text{m}^2
\]

\[
d_o = 14.93 \times 10^{-3} \text{m} \quad d_o = 14.93 \text{mm}

PROBLEM 1.60

Two horizontal 5-kip forces are applied to pin $B$ of the assembly shown. Knowing that a pin of 0.8-in. diameter is used at each connection, determine the maximum value of the average normal stress $(a)$ in link $AB$, $(b)$ in link $BC$.

SOLUTION

Use joint $B$ as free body.

Law of Sines

$$\frac{F_{AB}}{\sin 45^\circ} = \frac{F_{BC}}{\sin 60^\circ} = \frac{10}{\sin 95^\circ}$$

$$F_{AB} = 7.3205 \text{ kips}$$

$$F_{BC} = 8.9658 \text{ kips}$$

Link $AB$ is a tension member.

Minimum section at pin. $A_{net} = (1.8 - 0.8)(0.5) = 0.5 \text{ in}^2$

(a) Stress in $AB$ : $\sigma_{AB} = \frac{F_{AB}}{A_{net}} = \frac{7.3205}{0.5} = \sigma_{AB} = 14.64 \text{ ksi}$

(b) Stress in $BC$ : $\sigma_{BC} = \frac{-F_{BC}}{A} = \frac{-8.9658}{0.9} = \sigma_{BC} = -9.96 \text{ ksi}$
PROBLEM 1.61

For the assembly and loading of Prob. 1.60, determine (a) the average shearing stress in the pin at C, (b) the average bearing stress at C in member BC, (c) the average bearing stress at B in member BC.

PROBLEM 1.60

Two horizontal 5-kip forces are applied to pin B of the assembly shown. Knowing that a pin of 0.8-in. diameter is used at each connection, determine the maximum value of the average normal stress (a) in link AB, (b) in link BC.

SOLUTION

Use joint B as free body.

Law of Sines

\[ \frac{F_{AB}}{\sin 45^\circ} = \frac{F_{BC}}{\sin 60^\circ} = \frac{10}{\sin 95^\circ} \]

\[ F_{BC} = 8.9658 \text{ kips} \]

(a) Shearing stress in pin at C.

\[ \tau = \frac{F_{BC}}{2A_p} \]

\[ A_p = \frac{\pi}{4} d^2 = \frac{\pi}{4} (0.8)^2 = 0.5026 \text{ in}^2 \]

\[ \tau = \frac{8.9658}{(2)(0.5026)} = 8.92 \text{ ksi} \]

\[ \tau = 8.92 \text{ ksi} \]
PROBLEM 1.61 (Continued)

(b) Bearing stress at C in member BC.
\[ \sigma_b = \frac{F_{BC}}{A} \]
\[ A = td = (0.5)(0.8) = 0.4 \text{ in}^2 \]
\[ \sigma_b = \frac{8.9658}{0.4} = 22.4 \text{ ksi} \]
\[ \sigma_b = 22.4 \text{ ksi} \]

(c) Bearing stress at B in member BC.
\[ \sigma_b = \frac{F_{BC}}{A} \]
\[ A = 2td = 2(0.5)(0.8) = 0.8 \text{ in}^2 \]
\[ \sigma_b = \frac{8.9658}{0.8} = 11.21 \text{ ksi} \]
\[ \sigma_b = 11.21 \text{ ksi} \]
**PROBLEM 1.62**

In the marine crane shown, link $CD$ is known to have a uniform cross section of $50 \times 150 \text{ mm}$. For the loading shown, determine the normal stress in the central portion of that link.

**SOLUTION**

Weight of loading: 

$$W = (80 \text{ Mg})(9.81 \text{ m/s}^2) = 784.8 \text{ kN}$$

Free Body: Portion $ABC$

$$+\sum M_A = 0: \quad F_{CD}(15 \text{ m}) - W(28 \text{ m}) = 0$$

$$F_{CD} = \frac{28}{15} W = \frac{28}{15}(784.8 \text{ kN})$$

$$F_{CD} = +1465 \text{ kN}$$

Normal stress in $CD$:

$$\sigma_{CD} = \frac{F_{CD}}{A} = \frac{+1465 \times 10^3 \text{ N}}{(0.050 \text{ m})(0.150 \text{ m})} = +195.3 \times 10^6 \text{ Pa}$$

$$\sigma_{CD} = +195.3 \text{ MPa} \uparrow$$
PROBLEM 1.63

Two wooden planks, each $\frac{1}{2}$ in. thick and 9 in. wide, are joined by the dry mortise joint shown. Knowing that the wood used shears off along its grain when the average shearing stress reaches 1.20 ksi, determine the magnitude $P$ of the axial load that will cause the joint to fail.

SOLUTION

Six areas must be sheared off when the joint fails. Each of these areas has dimensions $\frac{5}{8}$ in. $\times \frac{1}{2}$ in., its area being

$$A = \frac{5}{8} \times \frac{1}{2} = \frac{5}{16} \text{ in}^2 = 0.3125 \text{ in}^2$$

At failure, the force carried by each area is

$$F = \tau A = (1.20 \text{ ksi})(0.3125 \text{ in}^2) = 0.375 \text{ kips}$$

Since there are six failure areas,

$$P = 6F = (6)(0.375) \quad P = 2.25 \text{ kips}$$
PROBLEM 1.64

Two wooden members of uniform rectangular cross section of sides \( a = 100 \text{ mm} \) and \( b = 60 \text{ mm} \) are joined by a simple glued joint as shown. Knowing that the ultimate stresses for the joint are \( \sigma_U = 1.26 \text{ MPa} \) in tension and \( \tau_U = 1.50 \text{ MPa} \) in shear, and that \( P = 6 \text{ kN} \), determine the factor of safety for the joint when (a) \( \alpha = 20^\circ \), (b) \( \alpha = 35^\circ \), (c) \( \alpha = 45^\circ \). For each of these values of \( \alpha \), also determine whether the joint will fail in tension or in shear if \( P \) is increased until rupture occurs.

Let \( \theta = 90^\circ - \alpha \) as shown.

From the text book:

\[
\sigma = \frac{P}{A_0} \cos^2 \theta \quad \tau = \frac{P}{A_0} \sin \theta \cos \theta
\]

or

\[
\sigma = \frac{P}{A_0} \sin^2 \alpha
\]

\[
\tau = \frac{P}{A_0} \sin \alpha \cos \alpha
\]  

(1)

\[
A_0 = ab = (100 \text{ mm})(60 \text{ mm}) = 6000 \text{ mm}^2 = 6 \times 10^{-3} \text{ m}^2
\]

\[
\sigma_U = 1.26 \times 10^6 \text{ Pa} \quad \tau_U = 1.50 \times 10^6 \text{ Pa}
\]

Ultimate load based on tension across the joint:

\[
(P_U)_\sigma = \frac{\sigma_U A_0}{\sin^2 \alpha} = \frac{(1.26 \times 10^6)(6 \times 10^{-3})}{\sin^2 \alpha}
\]

\[
= \frac{7560}{\sin^2 \alpha} = \frac{7.56}{\sin^2 \alpha} \text{ kN}
\]

Ultimate load based on shear across the joint:

\[
(P_U)_\tau = \frac{\tau_U A_0}{\sin \alpha \cos \alpha} = \frac{(1.50 \times 10^6)(6 \times 10^{-3})}{\sin \alpha \cos \alpha}
\]

\[
= \frac{9000}{\sin \alpha \cos \alpha} = \frac{9.00}{\sin \alpha \cos \alpha} \text{ kN}

(a) $\alpha = 20^\circ$: $(P_U)_\sigma = \frac{7.56}{\sin^2 20^\circ} = 64.63$ kN

$$= (P_U)_t = \frac{9.00}{\sin 20^\circ \cos 20^\circ} = 28.00$ kN

The smaller value governs. The joint will fail in shear and $P_U = 28.00$ kN.

$$F.S. = \frac{P_U}{P} = \frac{28.00}{6}$$

$b$ $\alpha = 35^\circ$: $(P_U)_\sigma = \frac{7.56}{\sin^2 35^\circ} = 22.98$ kN

$$(P_U)_t = \frac{9.00}{\sin 35^\circ \cos 35^\circ} = 19.155$ kN

Member ABC, which is supported by a pin and bracket at C and a cable BD, was designed to support the 16-kN load P as shown. Knowing that the ultimate load for cable BD is 100 kN, determine the factor of safety with respect to cable failure.

SOLUTION

Use member ABC as a free body, and note that member BD is a two-force member.

SOLUTION

Permitted member forces:

**PROBLEM 1.67**

Knowing that a force \( P \) of magnitude 750 N is applied to the pedal shown, determine (a) the diameter of the pin at \( C \) for which the average shearing stress in the pin is 40 MPa, (b) the corresponding bearing stress in the pedal at \( C \), (c) the corresponding bearing stress in each support bracket at \( C \).

**SOLUTION**

Draw free body diagram of \( BCD \). Since \( BCD \) is a 3-force member, the reaction at \( C \) is directed toward Point \( E \), the intersection of the lines of action of the other two forces.

From geometry, \( CE = \sqrt{300^2 + 125^2} = 325 \text{ mm} \)

\[ + \uparrow \sum F_y = 0 : \quad \frac{125}{325} C - P = 0 \quad C = 2.6 P = (2.6)(750) = 1950 \text{ N} \]

\[(a) \quad \tau_{\text{pin}} = \frac{\frac{1}{2} C}{A_{\text{pin}}} = \frac{\frac{1}{2} C}{\pi d^2} \quad d = \sqrt{\frac{2C}{\pi \tau_{\text{pin}}}} = \sqrt{\frac{(2)(1950)}{\pi (40 \times 10^6)}} = 5.57 \times 10^{-3} \text{ m} \]

\[d = 5.57 \text{ mm} \]

\[(b) \quad \sigma_b = \frac{C}{A_b} = \frac{C}{(5.57 \times 10^{-3})(9 \times 10^{-3})} = 38.9 \times 10^6 \text{ Pa} \quad \sigma_b = 38.9 \text{ MPa} \]

\[(c) \quad \sigma_b = \frac{\frac{1}{2} C}{A_b} = \frac{C}{2(5.57 \times 10^{-3})(5 \times 10^{-3})} = 35.0 \times 10^6 \text{ Pa} \quad \sigma_b = 35.0 \text{ MPa} \]
PROBLEM 1.68

A force \( P \) is applied as shown to a steel reinforcing bar that has been embedded in a block of concrete. Determine the smallest length \( L \) for which the full allowable normal stress in the bar can be developed. Express the result in terms of the diameter \( d \) of the bar, the allowable normal stress \( \sigma_{\text{all}} \) in the steel, and the average allowable bond stress \( \tau_{\text{all}} \) between the concrete and the cylindrical surface of the bar. (Neglect the normal stresses between the concrete and the end of the bar.)

SOLUTION

For shear, \[ A = \pi dL \]
\[ P = \tau_{\text{all}} A = \tau_{\text{all}} \pi dL \]

For tension, \[ A = \frac{\pi}{4} d^2 \]
\[ P = \sigma_{\text{all}} A = \sigma_{\text{all}} \left( \frac{\pi}{4} d^2 \right) \]

Equating, \[ \tau_{\text{all}} \pi dL = \sigma_{\text{all}} \frac{\pi}{4} d^2 \]

Solving for \( L \), \[ L_{\text{min}} = \frac{\sigma_{\text{all}} d/4}{\tau_{\text{all}}} \]
**PROBLEM 1.69**

The two portions of member $AB$ are glued together along a plane forming an angle $\theta$ with the horizontal. Knowing that the ultimate stress for the glued joint is 2.5 ksi in tension and 1.3 ksi in shear, determine the range of values of $\theta$ for which the factor of safety of the members is at least 3.0.

**SOLUTION**

\[ A_0 = (2.0)(1.25) = 2.50 \text{ in.}^2 \]
\[ P = 2.4 \text{ kips} \]
\[ P_U = (F.S.)P = 7.2 \text{ kips} \]

Based on tensile stress:

\[ \sigma_U = \frac{P_U}{A_0} \cos^2 \theta \]
\[ \cos^2 \theta = \frac{\sigma_U A_0}{P_U} = \frac{(2.5)(2.50)}{7.2} = 0.86806 \]
\[ \cos \theta = 0.93169 \quad \theta = 21.3^\circ \quad \theta > 21.3^\circ \]

Based on shearing stress:

\[ \tau_U = \frac{P_U}{A_0} \sin \theta \cos \theta = \frac{P_U}{2A_0} \sin 2\theta \]
\[ \sin 2\theta = \frac{2A_0 \tau_U}{P_U} = \frac{(2)(2.5)(1.3)}{7.2} = 0.90278 \]
\[ 2\theta = 64.52^\circ \quad \theta = 32.3^\circ \quad \theta < 32.3^\circ \]

Hence,\[ 21.3^\circ < \theta < 32.3^\circ \]
PROBLEM 1.70

The two portions of member $AB$ are glued together along a plane forming an angle $\theta$ with the horizontal. Knowing that the ultimate stress for the glued joint is 2.5 ksi in tension and 1.3 ksi in shear, determine $(a)$ the value of $\theta$ for which the factor of safety of the member is maximum, $(b)$ the corresponding value of the factor of safety. (Hint: Equate the expressions obtained for the factors of safety with respect to normal stress and shear.)

SOLUTION

At the optimum angle, 

$$(F.S.)_{\sigma} = (F.S.)_{\tau}$$

Normal stress: 

$$\sigma = \frac{P}{A_0} \cos^2 \theta \quad \therefore \quad P_{U,\sigma} = \frac{\sigma_U A_0}{\cos^2 \theta}$$

$$(F.S.)_{\sigma} = \frac{P_{U,\sigma}}{P} = \frac{\sigma_U A_0}{P \cos^2 \theta}$$

Shearing stress: 

$$\tau = \frac{P}{A_0} \sin \theta \cos \theta \quad \therefore \quad P_{U,\tau} = \frac{\tau_U A_0}{\sin \theta \cos \theta}$$

$$(F.S.)_{\tau} = \frac{P_{U,\tau}}{P} = \frac{\tau_U A_0}{P \sin \theta \cos \theta}$$

Equating: 

$$\frac{\sigma_U A_0}{P \cos^2 \theta} = \frac{\tau_U A_0}{P \sin \theta \cos \theta}$$

Solving: 

$$\frac{\sin \theta}{\cos \theta} = \tan \theta = \frac{\tau_U}{\sigma_U} = \frac{1.3}{2.5} = 0.520 \quad (a) \quad \theta_{\text{opt}} = 27.5^\circ$$

$$(b) \quad P_U = \frac{\sigma_U A_0}{\cos^2 \theta} = \frac{(12.5)(2.50)}{\cos^2 27.5^\circ} = 7.94 \text{ kips}$$

$$F.S. = \frac{P_U}{P} = \frac{7.94}{2.4} = 3.31$$

SOLUTION

(a) $\sigma_U = 400 \times 10^6$ Pa

$$A = \frac{\pi d^2}{4} = \frac{\pi (5)^2}{4} = 19.635 \text{ mm}^2 = 19.635 \times 10^{-6} \text{ m}^2$$

$$P_U = \sigma_U A = (400 \times 10^6)(19.635 \times 10^{-6}) = 7854 \text{ N}$$

$$P_{all} = \frac{P_U}{F.S} = \frac{7854}{3.2} = 2454 \text{ N}$$

$P_{all} = 2.45 \text{ kN}$

(b) $\delta = \frac{PL}{AE} = \frac{(2454)(80)}{(19.635 \times 10^{-6})(200 \times 10^6)} = 50.0 \times 10^{-3} \text{ m}$

$\delta = 50.0 \text{ mm}$
PROBLEM 2.2

A steel control rod is 5.5 ft long and must not stretch more than 0.04 in. when a 2-kip tensile load is applied to it. Knowing that $E = 29 \times 10^6$ psi, determine (a) the smallest diameter rod that should be used, (b) the corresponding normal stress caused by the load.

SOLUTION

(a) $\delta = \frac{PL}{AE}$ : $0.04 \text{ in.} = \frac{(2000 \text{ lb})(5.5 \times 12 \text{ in.})}{A(29 \times 10^6 \text{ psi})}$

$$A = \frac{1}{4} \pi d^2 = 0.11379 \text{ in}^2$$

$d = 0.38063 \text{ in.} \quad d = 0.381 \text{ in.}$

(b) $\sigma = \frac{P}{A} = \frac{2000 \text{ lb}}{0.11379 \text{ in}^2} = 17580 \text{ psi}$

$\sigma = 17.58 \text{ ksi}$
PROBLEM 2.3

Two gage marks are placed exactly 10 in. apart on a $\frac{1}{2}$-in.-diameter aluminum rod with $E = 10.1 \times 10^6$ psi and an ultimate strength of 16 ksi. Knowing that the distance between the gage marks is 10.009 in. after a load is applied, determine (a) the stress in the rod, (b) the factor of safety.

SOLUTION

(a) $\delta = 10.009 - 10.000 = 0.009$ in.

\[ \varepsilon = \frac{\delta}{L} = \frac{\sigma}{E} \quad \text{and} \quad \sigma = \frac{E \delta}{L} = \frac{(10.1 \times 10^6)(0.009)}{10} = 9.09 \times 10^3 \text{ psi} \]

$\sigma = 9.09$ ksi

(b) $F.S. = \frac{\sigma_U}{\sigma} = \frac{16}{9.09} = 1.760$
PROBLEM 2.4

An 18-m-long steel wire of 5-mm diameter is to be used in the manufacture of a prestressed concrete beam. It is observed that the wire stretches 45 mm when a tensile force $P$ is applied. Knowing that $E = 200$ GPa, determine $(a)$ the magnitude of the force $P$, $(b)$ the corresponding normal stress in the wire.

SOLUTION

(a) $\delta = \frac{PL}{AE}$, or $P = \frac{\delta AE}{L}$

with $A = \frac{1}{4} \pi d^2 = \frac{1}{4} \pi (0.005)^2 = 19.6350 \times 10^{-6} \text{m}^2$

$P = \frac{(0.045 \text{ m})(19.6350 \times 10^{-6} \text{m}^2)(200 \times 10^9 \text{N/m}^2)}{18 \text{ m}} = 9817.5 \text{ N}$

$P = 9.82 \text{ kN}$

(b) $\sigma = \frac{P}{A} = \frac{9817.5 \text{ N}}{19.6350 \times 10^{-6} \text{ m}^2} = 500 \times 10^6 \text{ Pa}$

$\sigma = 500 \text{ MPa}$
**PROBLEM 2.5**

**SOLUTION**

\[
A = \frac{\pi}{4} d^2 = \frac{\pi}{4} (0.5)^2 = 0.19635 \text{ in}^2
\]

(a) \[
\delta = \frac{PL}{AE} = \frac{(800)(12)}{(0.19635)(0.45 \times 10^6)} = 0.1086
\]

\( \delta = 0.1086 \text{ in.} \)

(b) \[
\sigma = \frac{P}{A} = \frac{800}{0.19635} = 4074 \text{ psi}
\]

\( \sigma = 4.07 \text{ ksi} \)
PROBLEM 2.6

A nylon thread is subjected to a 8.5-N tension force. Knowing that $E = 3.3 \text{ GPa}$ and that the length of the thread increases by 1.1%, determine (a) the diameter of the thread, (b) the stress in the thread.

SOLUTION

(a) Strain: $\varepsilon = \frac{\delta}{L} = \frac{1.1}{100} = 0.011$

Stress: $\sigma = E\varepsilon = (3.3 \times 10^9)(0.011) = 36.3 \times 10^6 \text{ Pa}$

Area: $A = \frac{P}{\sigma} = \frac{8.5}{36.3 \times 10^6} = 234.16 \times 10^{-6} \text{ m}^2$

Diameter: $d = \sqrt{\frac{4A}{\pi}} = \sqrt{\frac{(4)(234.16 \times 10^{-6})}{\pi}} = 546 \times 10^{-6} \text{ m} \implies d = 0.546 \text{ mm}$

(b) Stress: $\sigma = 36.3 \text{ MPa}$

SOLUTION

\[ \delta = \Delta L = L - L_0 = 250.18 - 250.00 = 0.18 \text{ mm} \]

\[ \varepsilon = \frac{\delta}{L_0} = \frac{0.18 \text{ mm}}{250 \text{ mm}} = 0.00072 \]

\[ A = \frac{\pi d^2}{4} = \frac{\pi}{4} (12)^2 = 113.097 \text{ mm}^2 = 113.097 \times 10^{-6} \text{ m}^2 \]

\[ \sigma = \frac{P}{A} = \frac{6000}{113.097 \times 10^{-6}} = 53.052 \times 10^6 \text{ Pa} \]

\[ E = \frac{\sigma}{\varepsilon} = \frac{53.052 \times 10^6}{0.00072} = 73.683 \times 10^9 \text{ Pa} \]

\[ E = 73.7 \text{ GPa} \]
PROBLEM 2.8

An aluminum pipe must not stretch more than 0.05 in. when it is subjected to a tensile load. Knowing that \( E = 10.1 \times 10^6 \) psi and that the maximum allowable normal stress is 14 ksi, determine \((a)\) the maximum allowable length of the pipe, \((b)\) the required area of the pipe if the tensile load is 127.5 kips.

SOLUTION

\[(a)\quad \delta = \frac{PL}{AE};\]

Thus,

\[
L = \frac{E A \delta}{P} = \frac{E \delta}{\sigma} = \frac{(10.1 \times 10^6)(0.05)}{14 \times 10^3}
\]

\[L = 36.1 \text{ in.} \uparrow\]

\[(b)\quad \sigma = \frac{P}{A};\]

Thus,

\[A = 9.11 \text{ in}^2 \uparrow\]
PROBLEM 2.9

An aluminum control rod must stretch 0.08 in. when a 500-lb tensile load is applied to it. Knowing that \( \sigma_{\text{all}} = 22 \text{ ksi} \) and \( E = 10.1 \times 10^6 \text{ psi} \), determine the smallest diameter and shortest length that can be selected for the rod.

SOLUTION

\[ P = 500 \text{ lb}, \quad \delta = 0.08 \text{ in.} \quad \sigma_{\text{all}} = 22 \times 10^3 \text{ psi} \]

\[
\sigma = \frac{P}{A} < \sigma_{\text{all}} \quad A > \frac{P}{\sigma_{\text{all}}} = \frac{500}{22 \times 10^3} = 0.022727 \text{ in}^2
\]

\[
A = \frac{\pi}{4} d^2 \quad d = \sqrt{\frac{4A}{\pi}} = \sqrt{(4)(0.022727)} = d_{\text{min}} = 0.1701 \text{ in.} \quad \blacksquare
\]

\[
\sigma = E \varepsilon = \frac{E \delta}{L} < \sigma_{\text{all}}

\[
L > \frac{E \delta}{\sigma_{\text{all}}} = \frac{(10.1 \times 10^6)(0.08)}{22 \times 10^3} = 36.7 \text{ in.} \quad L_{\text{min}} = 36.7 \text{ in.} \quad \blacksquare

PROBLEM 2.10

A square yellow-brass bar must not stretch more than 2.5 mm when it is subjected to a tensile load. Knowing that $E = 105 \text{ GPa}$ and that the allowable tensile strength is 180 MPa, determine (a) the maximum allowable length of the bar, (b) the required dimensions of the cross section if the tensile load is 40 kN.

SOLUTION

$\sigma = 180 \times 10^6 \text{ Pa} \quad P = 40 \times 10^3 \text{ N}$

$E = 105 \times 10^9 \text{ Pa} \quad \delta = 2.5 \times 10^{-3} \text{ m}$

(a) $\delta = \frac{PL}{AE} = \frac{\sigma L}{E}$

$L = \frac{E \delta}{\sigma} = \frac{(105 \times 10^9)(2.5 \times 10^{-3})}{180 \times 10^6} = 1.45833 \text{ m}$

$L = 1.458 \text{ m} \uparrow$

(b) $\sigma = \frac{P}{A}$

$A = \frac{P}{\sigma} = \frac{40 \times 10^3}{180 \times 10^6} = 222.22 \times 10^{-6} \text{ m}^2 = 222.22 \text{ mm}^2$

$A = a^2 \quad a = \sqrt{A} = \sqrt{222.22}$

$a = 14.91 \text{ mm} \uparrow
PROBLEM 2.11

A 4-m-long steel rod must not stretch more than 3 mm and the normal stress must not exceed 150 MPa when the rod is subjected to a 10-kN axial load. Knowing that $E = 200 \text{ GPa}$, determine the required diameter of the rod.

SOLUTION

$L = 4 \text{ m}$

$\delta = 3 \times 10^{-3} \text{ m}, \quad \sigma = 150 \times 10^6 \text{ Pa}$

$E = 200 \times 10^9 \text{ Pa}, \quad P = 10 \times 10^3 \text{ N}$

**Stress:**

$$\sigma = \frac{P}{A}$$

$$A = \frac{P}{\sigma} = \frac{10 \times 10^3}{150 \times 10^6} = 66.667 \times 10^{-6} \text{ m}^2 = 66.667 \text{ mm}^2$$

**Deformation:**

$$\delta = \frac{PL}{AE}$$

$$A = \frac{PL}{E\delta} = \frac{(10 \times 10^3)(4)}{(200 \times 10^9)(3 \times 10^{-3})} = 66.667 \times 10^{-6} \text{ m}^2 = 66.667 \text{ mm}^2$$

The larger value of $A$ governs:

$A = 66.667 \text{ mm}^2$

$A = \frac{\pi}{4} d^2$

$$d = \sqrt{\frac{4A}{\pi}} = \sqrt{\frac{4(66.667)}{\pi}}$$

$d = 9.21 \text{ mm}$
PROBLEM 2.12

A nylon thread is to be subjected to a 10-N tension. Knowing that $E = 3.2 \text{ GPa}$, that the maximum allowable normal stress is 40 MPa, and that the length of the thread must not increase by more than 1%, determine the required diameter of the thread.

SOLUTION

Stress criterion:

\[ \sigma = \frac{P}{A} \]
\[ A = \frac{P}{\sigma} = \frac{10 \text{ N}}{40 \times 10^6 \text{ Pa}} = 2.5 \times 10^{-9} \text{ m}^2 \]
\[ A = \frac{\pi d^2}{4} \]
\[ d = 2\sqrt{\frac{A}{\pi}} = 2\sqrt{\frac{2.5 \times 10^{-9}}{\pi}} = 564.19 \times 10^{-6} \text{ m} \]
\[ d = 0.564 \text{ mm} \]

Elongation criterion:

\[ \frac{\delta}{L} = 1\% = 0.01 \]
\[ \delta = \frac{PL}{AE} \]
\[ A = \frac{P/E}{\delta/L} = \frac{10 \text{ N}/3.2 \times 10^9 \text{ Pa}}{0.01} = 312.5 \times 10^{-9} \text{ m}^2 \]
\[ d = 2\sqrt{\frac{A}{\pi}} = 2\sqrt{\frac{312.5 \times 10^{-9}}{\pi}} = 630.78 \times 10^{-6} \text{ m} \]
\[ d = 0.631 \text{ mm} \]

The required diameter is the larger value: $d = 0.631 \text{ mm}$
PROBLEM 2.13

The 4-mm-diameter cable $BC$ is made of a steel with $E = 200$ GPa. Knowing that the maximum stress in the cable must not exceed 190 MPa and that the elongation of the cable must not exceed 6 mm, find the maximum load $P$ that can be applied as shown.

SOLUTION

$$L_{BC} = \sqrt{6^2 + 4^2} = 7.2111 \text{ m}$$

Use bar $AB$ as a free body.

$$\sum M_A = 0: \quad 3.5P - (6)\left(\frac{4}{7.2111}F_{BC}\right) = 0$$

$$P = 0.9509F_{BC}$$

Considering allowable stress: $\sigma = 190 \times 10^6 \text{ Pa}$

$$A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(0.004)^2 = 12.566 \times 10^{-6} \text{ m}^2$$

$$\sigma = \frac{F_{BC}}{A} \quad \therefore \quad F_{BC} = \sigma A = (190 \times 10^6)(12.566 \times 10^{-6}) = 2.388 \times 10^3 \text{ N}$$

Considering allowable elongation: $\delta = 6 \times 10^{-3} \text{ m}$

$$\delta = \frac{F_{BC}L_{BC}}{AE} \quad \therefore \quad F_{BC} = \frac{AE\delta}{L_{BC}} = \frac{(12.566 \times 10^{-6})(200 \times 10^9)(6 \times 10^{-3})}{7.2111} = 2.091 \times 10^3 \text{ N}$$

Smaller value governs. $F_{BC} = 2.091 \times 10^3 \text{ N}$

$$P = 0.9509F_{BC} = (0.9509)(2.091 \times 10^3) = 1.988 \times 10^3 \text{ N} \quad P = 1.988 \text{ kN}$$
PROBLEM 2.14

The aluminum rod $ABC$ ($E = 10.1 \times 10^6$ psi), which consists of two cylindrical portions $AB$ and $BC$, is to be replaced with a cylindrical steel rod $DE$ ($E = 29 \times 10^6$ psi) of the same overall length. Determine the minimum required diameter $d$ of the steel rod if its vertical deformation is not to exceed the deformation of the aluminum rod under the same load and if the allowable stress in the steel rod is not to exceed 24 ksi.

SOLUTION

Deformation of aluminum rod.

$$\delta_A = \frac{PL_{AB}}{A_{AB}E} + \frac{PL_{BC}}{A_{BC}E} = \frac{P}{E} \left( \frac{L_{AB}}{A_{AB}} + \frac{L_{BC}}{A_{BC}} \right)$$

$$\delta_A = \frac{28 \times 10^3}{10.1 \times 10^6} \left( \frac{12}{\frac{\pi}{4}(1.5)^2} + \frac{18}{\frac{\pi}{4}(2.25)^2} \right)$$

$$\delta_A = 0.031376 \text{ in.}$$

Steel rod.

$$\delta = 0.031376 \text{ in.}$$

$$\delta = \frac{PL}{EA} \therefore A = \frac{PL}{E \delta} = \frac{(28 \times 10^3)(30)}{(29 \times 10^6)(0.031376)} = 0.92317 \text{ in}^2$$

$$\sigma = \frac{P}{A} \therefore A = \frac{P}{\sigma} = \frac{28 \times 10^3}{24 \times 10^3} = 1.1667 \text{ in}^2$$

Required area is the larger value. $A = 1.1667 \text{ in}^2$

Diameter:

$$d = \sqrt{\frac{4A}{\pi}} = \sqrt{\frac{(4)(1.6667)}{\pi}}$$

$$d = 1.219 \text{ in.}$$
PROBLEM 2.15

A 4-ft section of aluminum pipe of cross-sectional area 1.75 in$^2$ rests on a fixed support at $A$. The $\frac{5}{8}$-in.-diameter steel rod $BC$ hangs from a rigid bar that rests on the top of the pipe at $B$. Knowing that the modulus of elasticity is $29 \times 10^6$ psi for steel, and $10.4 \times 10^6$ psi for aluminum, determine the deflection of point $C$ when a 15-kip force is applied at $C$.

SOLUTION

Rod $BC$:

$L_{BC} = 7 \text{ ft} = 84 \text{ in.}$  \hspace{1cm} $E_{BC} = 29 \times 10^6$ psi

$A_{BC} = \frac{\pi}{4} d^2 = \frac{\pi}{4} (0.625)^2 = 0.30680 \text{ in}^2$

$\delta_{C/B} = \frac{P L_{BC}}{E_{BC} A_{BC}} = \frac{(15 \times 10^3)(84)}{(29 \times 10^6)(0.30680)} = 0.141618 \text{ in.}$

Pipe $AB$:

$L_{AB} = 4 \text{ ft} = 48 \text{ in.}$  \hspace{1cm} $E_{AB} = 10.4 \times 10^6$ psi

$A_{AB} = 1.75 \text{ in}^2$

$\delta_{B/A} = \frac{P L_{AB}}{E_{AB} A_{AB}} = \frac{(15 \times 10^3)(48)}{(10.4 \times 10^6)(1.75)} = 39.560 \times 10^{-3} \text{ in.}$

Total:

$\delta_C = \delta_{B/A} + \delta_{C/B} = 39.560 \times 10^{-3} + 0.141618 = 0.181178 \text{ in.}$

$\delta_C = 0.1812 \text{ in.}$
PROBLEM 2.16

The brass tube $AB$ ($E = 105 \text{ GPa}$) has a cross-sectional area of 140 mm$^2$ and is fitted with a plug at $A$. The tube is attached at $B$ to a rigid plate that is itself attached at $C$ to the bottom of an aluminum cylinder ($E = 72 \text{ GPa}$) with a cross-sectional area of 250 mm$^2$. The cylinder is then hung from a support at $D$. In order to close the cylinder, the plug must move down through 1 mm. Determine the force $P$ that must be applied to the cylinder.

SOLUTION

Shortening of brass tube $AB$:

$L_{AB} = 375 + 1 = 376 \text{ mm} = 0.376 \text{ m}$  $A_{AB} = 140 \text{ mm}^2 = 140 \times 10^{-6} \text{ m}^2$  
$E_{AB} = 105 \times 10^9 \text{ Pa}$  
$\delta_{AB} = \frac{P L_{AB}}{E_{AB} A_{AB}} = \frac{P(0.376)}{(105 \times 10^9)(140 \times 10^{-6})} = 25.578 \times 10^{-9} P$

Lengthening of aluminum cylinder $CD$:

$L_{CD} = 0.375 \text{ m}$  $A_{CD} = 250 \text{ mm}^2 = 250 \times 10^{-6} \text{ m}^2$  $E_{CD} = 72 \times 10^9 \text{ Pa}$  
$\delta_{CD} = \frac{P L_{CD}}{E_{CD} A_{CD}} = \frac{P(0.375)}{(72 \times 10^9)(250 \times 10^{-6})} = 20.833 \times 10^{-9} P$

Total deflection:

$\delta_A = \delta_{AB} + \delta_{CD}$ where $\delta_A = 0.001 \text{ m}$

$0.001 = (25.578 \times 10^{-9} + 20.833 \times 10^{-9}) P$

$P = 21.547 \times 10^3 \text{ N}$  $P = 21.5 \text{ kN}$
PROBLEM 2.17

A 250-mm-long aluminum tube \((E = 70 \text{ GPa})\) of 36-mm outer diameter and 28-mm inner diameter can be closed at both ends by means of single-threaded screw-on covers of 1.5-mm pitch. With one cover screwed on tight, a solid brass rod \((E = 105 \text{ GPa})\) of 25-mm diameter is placed inside the tube and the second cover is screwed on. Since the rod is slightly longer than the tube, it is observed that the cover must be forced against the rod by rotating it one-quarter of a turn before it can be tightly closed. Determine \((a)\) the average normal stress in the tube and in the rod, \((b)\) the deformations of the tube and of the rod.

SOLUTION

\[
A_{\text{tube}} = \frac{\pi}{4}(d_o^2 - d_i^2) = \frac{\pi}{4}(36^2 - 28^2) = 402.12 \text{ mm}^2 = 402.12 \times 10^{-6} \text{ m}^2
\]

\[
A_{\text{rod}} = \frac{\pi}{4}d^2 = \frac{\pi}{4}(25)^2 = 490.87 \text{ mm}^2 = 490.87 \times 10^{-6} \text{ m}^2
\]

\[
\delta_{\text{tube}} = \frac{PL}{E_{\text{tube}}A_{\text{tube}}} = \frac{P(0.250)}{(70 \times 10^9)(402.12 \times 10^{-6})} = 8.8815 \times 10^{-9} P
\]

\[
\delta_{\text{rod}} = \frac{PL}{E_{\text{rod}}A_{\text{rod}}} = \frac{P(0.250)}{(105 \times 10^9)(490.87 \times 10^{-6})} = -4.8505 \times 10^{-9} P
\]

\[
\delta = \left(\frac{1}{4}\text{ turn}\right) \times 1.5 \text{ mm} = 0.375 \text{ mm} = 375 \times 10^{-6} \text{ m}
\]

\[
\delta_{\text{tube}} = \delta^* + \delta_{\text{rod}} \quad \text{or} \quad \delta_{\text{tube}} - \delta_{\text{rod}} = \delta^*
\]

\[
8.8815 \times 10^{-9} P + 4.8505 \times 10^{-9} P = 375 \times 10^{-6}
\]

\[
P = \frac{0.375 \times 10^{-3}}{(8.8815 + 4.8505) \times 10^{-9}} = 27.308 \times 10^3 \text{ N}
\]

\(a) \quad \sigma_{\text{tube}} = \frac{P}{A_{\text{tube}}} = \frac{27.308 \times 10^3}{402.12 \times 10^{-6}} = 67.9 \times 10^6 \text{ Pa} \quad \sigma_{\text{tube}} = 67.9 \text{ MPa} \uparrow
\]

\(\sigma_{\text{rod}} = \frac{-P}{A_{\text{rod}}} = \frac{-27.308 \times 10^3}{490.87 \times 10^{-6}} = -55.6 \times 10^6 \text{ Pa} \quad \sigma_{\text{rod}} = -55.6 \text{ MPa} \uparrow

\(b) \quad \delta_{\text{tube}} = (8.8815 \times 10^{-9})(27.308 \times 10^3) = 242.5 \times 10^{-6} \text{ m} \quad \delta_{\text{tube}} = 0.2425 \text{ mm} \uparrow
\]

\[
\delta_{\text{rod}} = -(4.8505 \times 10^{-9})(27.308 \times 10^3) = -132.5 \times 10^{-6} \text{ m} \quad \delta_{\text{rod}} = -0.1325 \text{ mm} \uparrow

PROBLEM 2.18

The specimen shown is made from a 1-in.-diameter cylindrical steel rod with two 1.5-in.-outer-diameter sleeves bonded to the rod as shown. Knowing that \( E = 29 \times 10^6 \) psi, determine (a) the load \( P \) so that the total deformation is 0.002 in., (b) the corresponding deformation of the central portion \( BC \).

SOLUTION

(a) \[ \delta = \sum \frac{P L_i}{A_i E_i} = \frac{P}{E} \sum \frac{L_i}{A_i} \]

\[ P = E \delta \left( \sum \frac{L_i}{A_i} \right)^{-1} = \frac{\pi}{4} d_i^2 \]

\text{BC} & 3 & 1.0 & 0.7854 & 3.8197 \\
\text{CD} & 2 & 1.5 & 1.7671 & 1.1318 \\

\end{array}
\]

\[ P = (29 \times 10^6)(0.002)(6.083)^{-1} = 9.353 \times 10^3 \text{lb} \]

\[ P = 9.53 \text{ kips} \]

(b) \[ \delta_{BC} = \frac{P L_{BC}}{A_{BC} E} = \frac{P}{E} \frac{L_{BC}}{A_{BC}} = \frac{9.535 \times 10^3}{29 \times 10^6}(3.8197) \]

PROBLEM 2.19

Both portions of the rod $ABC$ are made of an aluminum for which $E = 70$ GPa. Knowing that the magnitude of $P$ is 4 kN, determine (a) the value of $Q$ so that the deflection at $A$ is zero, (b) the corresponding deflection of $B$.

SOLUTION

(a) $A_{AB} = \frac{\pi}{4}d_{AB}^2 = \frac{\pi}{4}(0.020)^2 = 314.16 \times 10^{-6} \text{ m}^2$

$A_{BC} = \frac{\pi}{4}d_{BC}^2 = \frac{\pi}{4}(0.060)^2 = 2.8274 \times 10^{-3} \text{ m}^2$

Force in member $AB$ is $P$ tension.

Elongation:

$$\delta_{AB} = \frac{PL_{AB}}{EA_{AB}} = \frac{(4 \times 10^3)(0.4)}{(70 \times 10^3)(314.16 \times 10^{-6})} = 72.756 \times 10^{-6} \text{ m}$$

Force in member $BC$ is $Q - P$ compression.

Shortening:

$$\delta_{BC} = \frac{(Q - P)L_{BC}}{EA_{BC}} = \frac{(Q - P)(0.5)}{(70 \times 10^3)(2.8274 \times 10^{-3})} = 2.5263 \times 10^{-9}(Q - P)$$

For zero deflection at $A$, $\delta_{BC} = \delta_{AB}$

$$2.5263 \times 10^{-9}(Q - P) = 72.756 \times 10^{-6} \quad : \quad Q - P = 28.8 \times 10^3 \text{ N}$$

$$Q = 28.3 \times 10^3 + 4 \times 10^3 = 32.8 \times 10^3 \text{ N} \quad Q = 32.8 \text{ kN}$$

(b) $\delta_{AB} = \delta_{BC} = 72.756 \times 10^{-6} \text{ m} \quad \delta_{AB} = 0.0728 \text{ mm}$

SOLUTION

Statics: Reactions are 114 kN upward at \( A \) and \( C \).

Member \( BD \) is a zero force member.

\[ L_{AB} = \sqrt{4.0^2 + 2.5^2} = 4.717 \text{ m} \]

Use joint \( A \) as a free body.

\[ +\sum F_x = 0 : F_{AD} + \frac{4}{4.717} F_{AB} = 0 \]

\[ F_{AD} = -\frac{4(-215.10)}{4.717} = 182.4 \text{ kN} \]

Knowing that \( E = 29 \times 10^6 \) psi, determine where a 50-lb block should be placed on the beam in order to cause contact between \( B \) and \( E \).

SOLUTION

Rigid beam \( ACB \) rotates through angle \( \theta \) to close gap.

\[

Point \( C \) moves downward.

\[
\delta_C = 4\theta = 4(3.125 \times 10^{-3}) = 12.5 \times 10^{-3} \text{ in.}

Knowing that they support rigid member $ABC$ determine the maximum force $P$ that can be applied vertically at point $A$ if the deflection of $A$ is not to exceed 0.35 mm.

SOLUTION

Free body member $AC$:

$$\sum M_C = 0: \quad 0.350P - 0.225F_{BD} = 0$$

From geometry,
\[
\tan \alpha = \frac{b - a}{h}
\]

\[
a_1 = \frac{a}{\tan \alpha}, \quad b_1 = \frac{b}{\tan \alpha}, \quad r = y \tan \alpha
\]

At coordinate point \( y \), \( A = \pi r^2 \)

Deformation of element of height \( dy \):
\[
d\delta = \frac{Pdy}{AE}
\]

\[
d\delta = \frac{P}{E\pi r^2} dy = \frac{P}{\pi E \tan^2 \alpha} \frac{dy}{y^2}
\]

Total deformation.
\[
\delta_A = \frac{P}{\pi E \tan^2 \alpha} \int_a^{b_1} \frac{dy}{y^2} = \frac{P}{\pi E \tan^2 \alpha} \left( \int_1^{b_1} \frac{1}{y} dy \right) = \frac{P}{\pi E \tan^2 \alpha} \left( \frac{1}{a_1} - \frac{1}{b_1} \right)
\]

\[
\delta_A = \frac{P(h - a_1)}{\pi E a b_1}
\]

\[
\delta_A = \frac{P h}{\pi E a b} \downarrow \blacktriangle

PROBLEM 2.30

A homogeneous cable of length $L$ and uniform cross section is suspended from one end. (a) Denoting by $\rho$ the density (mass per unit volume) of the cable and by $E$ its modulus of elasticity, determine the elongation of the cable due to its own weight. (b) Show that the same elongation would be obtained if the cable were horizontal and if a force equal to half of its weight were applied at each end.

SOLUTION

(a) For element at point identified by coordinate $y$,

$$P = \text{weight of portion below the point} = \rho g A (L - y)$$

$$d \delta = \frac{P dy}{EA} = \frac{\rho g A (L - y) dy}{EA} = \frac{\rho g (L - y) dy}{E}$$

$$\delta = \int_{0}^{L} \frac{\rho g (L - y)}{E} dy = \frac{\rho g}{E} \left( Ly - \frac{1}{2} y^2 \right)_{0}^{L}$$

$$\delta = \frac{1}{2} \frac{\rho g L^2}{E}$$

(b) Total weight:

$$W = \rho g A L$$

$$F = \frac{EA \delta}{L} = \frac{EA}{L} \cdot \frac{1}{2} \frac{\rho g L^2}{E} = \frac{1}{2} \rho g A L$$

$$F = \frac{1}{2} W$$

$$F = \frac{1}{2} W$$
PROBLEM 2.31

The volume of a tensile specimen is essentially constant while plastic deformation occurs. If the initial diameter of the specimen is \( d_1 \), show that when the diameter is \( d \), the true strain is \( \varepsilon_t = 2 \ln(d_1/d) \).

SOLUTION

If the volume is constant, \( \frac{\pi}{4} d^2 L = \frac{\pi}{4} d_1^2 L_0 \)

\[
\frac{L}{L_0} = \frac{d_1^2}{d^2} = \left( \frac{d_1}{d} \right)^2
\]

\( \varepsilon_t = \ln \frac{L}{L_0} = \ln \left( \frac{d_1}{d} \right)^2 \)

\( \varepsilon_t = 2 \ln \left( \frac{d_1}{d} \right) \) \hfill \blacktriangle
PROBLEM 2.32

Denoting by $\varepsilon$ the “engineering strain” in a tensile specimen, show that the true strain is $\varepsilon_t = \ln(1 + \varepsilon)$.

SOLUTION

\[ \varepsilon_t = \ln \frac{L}{L_0} = \ln \frac{L_0 + \delta}{L_0} = \ln \left( 1 + \frac{\delta}{L_0} \right) = \ln (1 + \varepsilon) \]

Thus $\varepsilon_t = \ln (1 + \varepsilon)$.
PROBLEM 2.33
An axial force of 200 kN is applied to the assembly shown by means of rigid end plates. Determine (a) the normal stress in the aluminum shell, (b) the corresponding deformation of the assembly.

SOLUTION
Let \( P_a \) = Portion of axial force carried by shell
\( P_b \) = Portion of axial force carried by core.

\[
\delta = \frac{P_a L}{E_a A_a}, \quad \text{or} \quad \delta = \frac{E_a A_a}{L} \delta
\]

\[
\delta = \frac{P_b L}{E_b A_b}, \quad \text{or} \quad \delta = \frac{E_b A_b}{L} \delta
\]

Thus,
\[
P = P_a + P_b = \left( E_a A_a + E_b A_b \right) \frac{\delta}{L}
\]

with
\[
A_a = \frac{\pi}{4} \left[ (0.060)^2 - (0.025)^2 \right] = 2.3366 \times 10^{-3} \text{ m}^2
\]
\[
A_b = \frac{\pi}{4} (0.025)^2 = 0.49087 \times 10^{-3} \text{ m}^2
\]

\[
P = \left[ (70 \times 10^9) (2.3366 \times 10^{-3}) + (105 \times 10^9) (0.49087 \times 10^{-3}) \right] \frac{\delta}{L}
\]

\[
P = 215.10 \times 10^6 \frac{\delta}{L}
\]

Strain:
\[
\varepsilon = \frac{\delta}{L} = \frac{P}{215.10 \times 10^6} = \frac{200 \times 10^3}{215.10 \times 10^6} = 0.92980 \times 10^{-3}
\]

\[(a) \quad \sigma_a = E_a \varepsilon = (70 \times 10^9)(0.92980 \times 10^{-3}) = 65.1 \times 10^6 \text{ Pa} \quad \sigma_a = 65.1 \text{ MPa} \]

\[(b) \quad \delta = \varepsilon L = (0.92980 \times 10^{-3})(300 \text{ mm}) \quad \delta = 0.279 \text{ mm} \]
PROBLEM 2.34

The length of the assembly shown decreases by 0.40 mm when an axial force is applied by means of rigid end plates. Determine (a) the magnitude of the applied force, (b) the corresponding stress in the brass core.

SOLUTION

Let \( P_a \) = Portion of axial force carried by shell and \( P_b \) = Portion of axial force carried by core.

\[
\delta = \frac{P_a L}{E_a A_a}, \quad \text{or} \quad P_a = \frac{E_a A_a}{L} \delta
\]

\[
\delta = \frac{P_b L}{E_b A_b}, \quad \text{or} \quad P_b = \frac{E_b A_b}{L} \delta
\]

Thus, \( P = P_a + P_b = \left( \frac{E_a A_a}{L} + \frac{E_b A_b}{L} \right) \delta \)

with

\[
A_a = \frac{\pi}{4} [(0.060)^2 - (0.025)^2] = 2.3366 \times 10^{-3} \text{ m}^2
\]

\[
A_b = \frac{\pi}{4} (0.025)^2 = 0.49087 \times 10^{-3} \text{ m}^2
\]

\[
P = \left[ (70 \times 10^9)(2.3366 \times 10^{-3}) + (105 \times 10^9)(0.49087 \times 10^{-3}) \right] \frac{\delta}{L} = 215.10 \times 10^6 \frac{\delta}{L}
\]

with \( \delta = 0.40 \text{ mm}, \ L = 300 \text{ mm} \)

(a) \( P = \left( 215.10 \times 10^6 \right) \frac{0.40}{300} = 286.8 \times 10^3 \text{ N} \)

\( P = 287 \text{ kN} \)

(b) \( \sigma_b = \frac{P_b}{A_b} \frac{E_b \delta}{L} = \frac{(105 \times 10^9)(0.40 \times 10^{-3})}{300 \times 10^{-3}} = 140 \times 10^6 \text{ Pa} \)

\( \sigma_b = 140.0 \text{ MPa} \)
PROBLEM 2.35

A 4-ft concrete post is reinforced with four steel bars, each with a $\frac{3}{4}$-in. diameter. Knowing that $E_s = 29 \times 10^6$ psi and $E_c = 3.6 \times 10^6$ psi, determine the normal stresses in the steel and in the concrete when a 150-kip axial centric force $P$ is applied to the post.

SOLUTION

\[ A_s = 4 \left[ \pi \left( \frac{3}{4} \right)^2 \right] = 1.76715 \text{ in}^2 \]

\[ A_c = 8^2 - A_s = 62.233 \text{ in}^2 \]

\[ \delta_s = \frac{P_L}{AE_s} = \frac{P_s(48)}{(1.76715)(29 \times 10^6)} = 0.93663 \times 10^{-6} P_s \]

\[ \delta_c = \frac{P_L}{AE_c} = \frac{P_c(48)}{(62.233)(3.6 \times 10^6)} = 0.21425 \times 10^{-6} P_c \]

But $\delta_s = \delta_c$: $0.93663 \times 10^{-6} P_s = 0.21425 \times 10^{-6} P_c$

\[ P_s = 0.22875 P_c \quad (1) \]

Also:

\[ P_s + P_c = P = 150 \text{ kips} \quad (2) \]

Substituting (1) into (2):

\[ 1.22875 P_c = 150 \text{ kips} \]

\[ P_c = 122.075 \text{ kips} \]

From (1):

\[ P_s = 0.22875(122.075) = 27.925 \text{ kips} \]

\[ \sigma_s = \frac{-P_s}{A_s} = -\frac{27.925}{1.76715} \quad \sigma_s = -15.80 \text{ ksi} \]

\[ \sigma_c = \frac{-P_c}{A_c} = -\frac{122.075}{62.233} \quad \sigma_c = -1.962 \text{ ksi} \]

If it is subjected to centric forces of magnitude $P = 30$ kN, and knowing that $E_a = 70$ GPa and $E_b = 105$ GPa, determine the normal stress ($a$) in the aluminum layers, ($b$) in the brass layer.

SOLUTION

For each layer,

$$A = (30)(5) = 150 \text{ mm}^2 = 150 \times 10^{-6} \text{ m}^2$$

Let $P_a = \text{load on each aluminum layer}$

$$P = 2P_a + P_b = 3.5 \ P_a$$

Solving for $P_a$ and $P_b$,

$$P_a = \frac{2}{7} P \quad P_b = \frac{3}{7} P$$

(a) $\sigma_a = -\frac{P_a}{A} = -\frac{2}{7} \frac{P}{150 \times 10^{-6}} = -57.1 \times 10^6 \text{ Pa}$

$$\sigma_a = -57.1 \text{ MPa}$$

(b) $\sigma_b = -\frac{P_b}{A} = -\frac{3}{7} \frac{P}{150 \times 10^{-6}} = -85.7 \times 10^6 \text{ Pa}$

$$\sigma_b = -85.7 \text{ MPa}$$

$$P_a = \frac{2}{7} P$$

$$P_b = \frac{E_b}{E_a} P_a = \frac{105}{70} P_a = 1.5 P_a$$

$$\delta = -\frac{P_aL}{E_aA} = -\frac{2}{7} \frac{PL}{E_aA}$$

$$= -\frac{2}{7} \frac{(45 \times 10^3)(250 \times 10^{-3})}{(70 \times 10^9)(150 \times 10^{-6})}$$

SOLUTION

Let $P_a =$ portion of axial force carried by shell

$P_s =$ portion of axial force carried by core

$$\delta = \frac{P_a L}{E_a A_a} \quad P_a = \frac{E_a A_a}{L} \delta$$

$$\delta = \frac{P_s L}{E_s A_s} \quad P_s = \frac{E_s A_s}{L} \delta$$

Total force:

$$P = P_a + P_s = (E_a A_a + E_s A_s) \frac{\delta}{L}$$

$$\frac{\delta}{L} = \varepsilon = \frac{P}{E_a A_a + E_s A_s}$$

Data:

$P = 40 \times 10^3$ lb

$A_a = \frac{\pi}{4} (d_0^2 - d_i^2) = \frac{\pi}{4} (2.5^2 - 1.0)^2 = 4.1233$ in$^2$

$A_s = \frac{\pi}{4} d_i^2 = \frac{\pi}{4} (1)^2 = 0.7854$ in$^2$

$$\varepsilon = \frac{-40 \times 10^3}{(10.1 \times 10^6)(4.1233) + (29 \times 10^6)(0.7854)} = -620.91 \times 10^{-6}$$

(a) $\sigma_s = E_s \varepsilon = (29 \times 10^6)(-620.91 \times 10^{-6}) = -18.01 \times 10^3$ psi $\quad -18.01$ ksi $\blacktriangle$

(b) $\delta = L \varepsilon = (10)(620.91 \times 10^{-6}) = -6.21 \times 10^{-3}$ $\delta = -6.21 \times 10^{-3}$ in. $\blacktriangle$
PROBLEM 2.39

Three wires are used to suspend the plate shown. Aluminum wires of $\frac{1}{8}$-in. diameter are used at A and B while a steel wire of $\frac{1}{12}$-in. diameter is used at C. Knowing that the allowable stress for aluminum \((E_a = 10.4 \times 10^6 \text{ psi})\) is 14 ksi and that the allowable stress for steel \((E_s = 29 \times 10^6 \text{ psi})\) is 18 ksi, determine the maximum load \(P\) that can be applied.

SOLUTION

By symmetry, \(P_A = P_B\), and \(\delta_A = \delta_B\). Also, \(\delta_C = \delta_A = \delta_B = \delta\).

Strain in each wire:

\[ \epsilon_A = \frac{\delta}{2L}, \quad \epsilon_C = \frac{\delta}{L} = 2 \epsilon_A \]

Determine allowable strain.

Wires A&B:

\[ \epsilon_A = \frac{\sigma_A}{E_A} = \frac{14 \times 10^3}{10.4 \times 10^6} = 1.3462 \times 10^{-3} \]

\[ \epsilon_C = 2 \epsilon_A = 2.6924 \times 10^{-4} \]

Wire C:

\[ \epsilon_C = \frac{\sigma_C}{E_C} = \frac{18 \times 10^3}{29 \times 10^6} = 0.6207 \times 10^{-3} \]

\[ \epsilon_A = \epsilon_B = \frac{1}{2} \epsilon_C = 0.3103 \times 10^{-6} \]

Allowable strain for wire C governs, \(\therefore \sigma_C = 18 \times 10^3 \text{ psi}\)

\[ \sigma_A = E_A \epsilon_A \]

\[ P_A = A_A \sigma_A = \pi \left( \frac{1}{8} \right)^2 (10.4 \times 10^6)(0.3103 \times 10^{-6}) = 39.61 \text{ lb} \]

\[ P_B = 39.61 \text{ lb} \]

\[ \sigma_C = E_C \epsilon_C \]

\[ P_C = A_C \sigma_C = \pi \left( \frac{1}{12} \right)^2 (18 \times 10^3) = 98.17 \text{ lb} \]

For equilibrium of the plate,

\[ P = P_A + P_B + P_C = 177.4 \text{ lb} \]

\( P = 177.4 \text{ lb \hspace{1cm} } \)
PROBLEM 2.40

A polystyrene rod consisting of two cylindrical portions \( AB \) and \( BC \) is restrained at both ends and supports two 6-kip loads as shown. Knowing that \( E = 0.45 \times 10^6 \) psi, determine \((a)\) the reactions at \( A \) and \( C \), \((b)\) the normal stress in each portion of the rod.

**SOLUTION**

\((a)\) We express that the elongation of the rod is zero:

\[
\delta = \frac{P_{AB} L_{AB}}{\frac{\pi}{4} d_{AB}^2 E} + \frac{P_{BC} L_{BC}}{\frac{\pi}{4} d_{BC}^2 E} = 0
\]

But \( P_{AB} = +R_A \) \( P_{BC} = -R_C \)

Substituting and simplifying:

\[
R_A L_{AB} d_{AB}^2 - R_C L_{BC} d_{BC}^2 = 0
\]

\[
R_C = \frac{L_{AB}}{L_{BC}} \left( \frac{d_{BC}}{d_{AB}} \right)^2 \frac{25}{15} \left( \frac{2}{1.25} \right)^2 R_A
\]

\[
R_C = 4.2667 R_A
\] \((1)\)

From the free body diagram: \( R_A + R_C = 12 \) kips \((2)\)

Substituting \((1)\) into \((2)\):

\[
5.2667 R_A = 12
\]

\[
R_A = 2.2785 \text{ kips}
\]

\[
R_A = 2.28 \text{ kips} \uparrow \blacktriangle
\]

From \((1)\):

\[
R_C = 4.2667(2.2785) = 9.7217 \text{ kips}
\]

\[
R_C = 9.72 \text{ kips} \uparrow \blacktriangle
\]

\((b)\) 

\[
\sigma_{AB} = \frac{P_{AB}}{A_{AB}} = \frac{R_A}{A_{AB}} = \frac{2.2785}{\frac{\pi}{4}(1.25)^2} = 1.857 \text{ ksi} \blacktriangle

\[
\sigma_{BC} = \frac{P_{BC}}{A_{BC}} = \frac{-R_C}{A_{BC}} = \frac{-9.7217}{\frac{\pi}{4}(2)^2} = -3.09 \text{ ksi} \blacktriangle

**SOLUTION**

**A to C:**

$E = 200 \times 10^9 \text{ Pa}$

$A = \frac{\pi}{4} (40)^2 = 1.25664 \times 10^3 \text{ mm}^2 = 1.25664 \times 10^{-3} \text{ m}^2$

$EA = 251.327 \times 10^6 \text{ N}$

**C to E:**

$E = 105 \times 10^9 \text{ Pa}$

$A = \frac{\pi}{4} (30)^2 = 706.86 \text{ mm}^2 = 706.86 \times 10^{-6} \text{ m}^2$

$EA = 74.220 \times 10^6 \text{ N}$

**A to B:**

$P = R_A$

$L = 180 \text{ mm} = 0.180 \text{ m}$

$\delta_{AB} = \frac{PL}{EA} = \frac{R_A(0.180)}{251.327 \times 10^6}$

$= 716.20 \times 10^{-12} R_A$

**B to C:**

$P = R_A - 60 \times 10^3$

$L = 120 \text{ mm} = 0.120 \text{ m}$

$\delta_{BC} = \frac{PL}{EA} = \frac{(R_A - 60 \times 10^3)(0.120)}{251.327 \times 10^6}$

$= 447.47 \times 10^{-12} R_A - 26.848 \times 10^{-6}$
PROBLEM 2.41 (Continued)

C to D: \[ P = R_A - 60 \times 10^3 \]
\[ L = 100 \text{ mm} = 0.100 \text{ m} \]
\[ \delta_{BC} = \frac{PL}{EA} = \frac{(R_A - 60 \times 10^3)(0.100)}{74.220 \times 10^6} \]
\[ = 1.34735 \times 10^{-9} R_A - 80.841 \times 10^{-6} \]

D to E: \[ P = R_A - 100 \times 10^3 \]
\[ L = 100 \text{ mm} = 0.100 \text{ m} \]
\[ \delta_{DE} = \frac{PL}{EA} = \frac{(R_A - 100 \times 10^3)(0.100)}{74.220 \times 10^6} \]
\[ = 1.34735 \times 10^{-9} R_A - 134.735 \times 10^{-6} \]

A to E: \[ \delta_{AE} = \delta_{AB} + \delta_{BC} + \delta_{CD} + \delta_{DE} \]
\[ = 3.85837 \times 10^{-9} R_A - 242.424 \times 10^{-6} \]

Since point E cannot move relative to A, \[ \delta_{AE} = 0 \]

(a) \[ 3.85837 \times 10^{-9} R_A - 242.424 \times 10^{-6} = 0 \]
\[ R_A = 62.831 \times 10^3 \text{ N} \]
\[ R_A = 62.8 \text{ kN} \]
\[ R_E = R_A - 100 \times 10^3 = 62.8 \times 10^3 - 100 \times 10^3 = -37.2 \times 10^3 \text{ N} \]
\[ R_E = 37.2 \text{ kN} \]

(b) \[ \delta_C = \delta_{AB} + \delta_{BC} = 1.16367 \times 10^{-9} R_A - 26.848 \times 10^{-6} \]
\[ = (1.16367 \times 10^{-9})(62.831 \times 10^3) - 26.848 \times 10^{-6} \]
\[ = 46.3 \times 10^{-6} \text{ m} \]
\[ \delta_C = 46.3 \mu \text{m} \]

$L = 120 \text{ mm} = 0.120 \text{ m}$

$\delta_{BC} = \frac{PL}{EA} = \frac{(R_A - 60 \times 10^3) (0.120)}{131.947 \times 10^6}$

$= 909.456 \times 10^{-12} R_A - 54.567 \times 10^{-6}$

$C$ to $D$: $P = R_A - 60 \times 10^3$

$L = 100 \text{ mm} = 0.100 \text{ m}$

$\delta_{CD} = \frac{PL}{EA} = \frac{(R_A - 60 \times 10^3) (0.100)}{141.372 \times 10^6}$

$= 707.354 \times 10^{-12} R_A - 42.441 \times 10^{-6}$
**PROBLEM 2.42 (Continued)**

D to E: \( P = R_A - 100 \times 10^3 \)  
\( L = 100 \text{ mm} = 0.100 \text{ m} \)  
\[ \delta_{DE} = \frac{PL}{EA} = \frac{(R_A - 100 \times 10^3)(0.100)}{141.372 \times 10^6} \]  
\[ = 707.354 \times 10^{-12} R_A - 70.735 \times 10^{-6} \]

A to E: \( \delta_{AE} = \delta_{AB} + \delta_{BC} + \delta_{CD} + \delta_{DE} \)
\[ = 3.68834 \times 10^{-9} R_A - 167.743 \times 10^{-6} \]

Since point E cannot move relative to A, \( \delta_{AE} = 0 \)

(a) \( 3.68834 \times 10^{-9} R_A - 167.743 \times 10^{-6} = 0 \)
\( R_A = 45.479 \times 10^3 \text{ N} \)
\( R_A = 45.5 \text{ kN} \)  
\( R_E = R_A - 100 \times 10^3 = 45.479 \times 10^3 - 100 \times 10^3 = -54.521 \times 10^5 \)
\( R_E = 54.5 \text{ kN} \)

(b) \( \delta_C = \delta_{AB} + \delta_{BC} = 2.27364 \times 10^{-9} R_A - 54.567 \times 10^{-6} \)
\[ = (2.27364 \times 10^{-9})(45.479 \times 10^3) - 54.567 \times 10^{-6} \]
\[ = 48.8 \times 10^{-6} \text{ m} \]
\( \delta_C = 48.8 \mu \text{m} \)
PROBLEM 2.43

The rigid bar $ABCD$ is suspended from four identical wires. Determine the tension in each wire caused by the load $P$ shown.

SOLUTION

Deformations Let $\theta$ be the rotation of bar $ABCD$ and $\delta_A$, $\delta_B$, $\delta_C$, and $\delta_D$ be the deformations of wires $A$, $B$, $C$, and $D$.

From geometry,

$$\theta = \frac{\delta_B - \delta_A}{L}$$

$$\delta_B = \delta_A + L\theta$$

$$\delta_C = \delta_A + 2L\theta = 2\delta_B - \delta_A$$  \hspace{1cm} (1)

$$\delta_D = \delta_A + 3L\theta = 3\delta_B - 2\delta_A$$  \hspace{1cm} (2)

Since all wires are identical, the forces in the wires are proportional to the deformations.

$$T_C = 2T_B - T_A$$  \hspace{1cm} (1')

$$T_D = 3T_B - 2T_A$$  \hspace{1cm} (2')
PROBLEM 2.43  (Continued)

Use bar $ABCD$ as a free body.

\[ \Sigma M_C = 0 : \quad -2LT_A - LT_B + LT_D = 0 \quad (3) \]
\[ \Sigma F_y = 0 : \quad T_A + T_B + T_C + T_D - P = 0 \quad (4) \]

Substituting (2') into (3) and dividing by $L$,
\[ -4T_A + 2T_B = 0 \quad T_B = 2T_A \quad (3') \]

Substituting (1'), (2'), and (3') into (4),
\[ T_A + 2T_A + 3T_A + 4T_A - P = 0 \quad 10T_A = P \]
\[ T_A = \frac{1}{10} P \quad \blacktriangle \]
\[ T_B = 2T_A = (2) \left( \frac{1}{10} \right) P \quad T_B = \frac{1}{5} P \quad \blacktriangle \]
\[ T_C = (2) \left( \frac{1}{5} P \right) - \left( \frac{1}{10} \right) P \quad T_C = \frac{3}{10} P \quad \blacktriangle \]
\[ T_D = (3) \left( \frac{1}{5} P \right) - (2) \left( \frac{1}{10} P \right) \quad T_D = \frac{2}{5} P \quad \blacktriangle \]
PROBLEM 2.44

The rigid bar $AD$ is supported by two steel wires of $\frac{1}{16}$-in. diameter ($E = 29 \times 10^6$ psi) and a pin and bracket at $D$. Knowing that the wires were initially taut, determine $(a)$ the additional tension in each wire when a 120-lb load $P$ is applied at $B$, $(b)$ the corresponding deflection of point $B$.

SOLUTION

Let $\theta$ be the rotation of bar $ABCD$.

Then $\delta_A = 24\theta$, $\delta_C = 8\theta$

$$\delta_A = \frac{P_{AE}L_{AE}}{AE}$$

$$P_{AE} = \frac{EA\delta_A}{L_{AE}} = \frac{(29 \times 10^6) \frac{\pi}{4} \left(\frac{1}{16}\right)^2 (24\theta)}{15} = 142.353 \times 10^3 \theta$$

$$\delta_C = \frac{P_{CF}L_{CF}}{AE}$$

$$P_{CF} = \frac{EA\delta_C}{L_{CF}} = \frac{(29 \times 10^6) \frac{\pi}{4} \left(\frac{1}{16}\right)^2 (8\theta)}{8} = 88.971 \times 10^3 \theta$$

Using free body $ABCD$,

$$\sum M_D = 0: -24P_{AE} + 16P - 8P_{CF} = 0$$

$$-24(142.353 \times 10^3 \theta) + 16(120) - 8(88.971 \times 10^3 \theta) = 0$$

$$\theta = 0.46510 \times 10^{-3} \text{ rad}$$

$(a)$ $P_{AE} = (142.353 \times 10^3) (0.46510 \times 10^{-3}) = 66.2 \text{ lb}$

$(b)$ $P_{CF} = (88.971 \times 10^3) (0.46510 \times 10^{-3}) = 41.4 \text{ lb}$

$(a)$ $\delta_B = 16\theta = 16(0.46510 \times 10^{-3}) = 7.44 \times 10^{-3} \text{ in.}$
PROBLEM 2.45

The steel rods $BE$ and $CD$ each have a 16-mm diameter ($E = 200 \text{ GPa}$); the ends of the rods are single-threaded with a pitch of 2.5 mm. Knowing that after being snugly fitted, the nut at $C$ is tightened one full turn, determine ($a$) the tension in rod $CD$, ($b$) the deflection of point $C$ of the rigid member $ABC$.

SOLUTION

Let $\theta$ be the rotation of bar $ABC$ as shown.

Then

$$\delta_B = 0.15\theta \quad \delta_C = 0.25\theta$$

But

$$\delta_C = \delta_{\text{turn}} - \frac{P_{CD}}{E_{CD}A_{CD}} \frac{L_{CD}}{L_{CD}}$$

$$P_{CD} = \frac{E_{CD}A_{CD}}{L_{CD}} (\delta_{\text{turn}} - \delta_C)$$

$$= \frac{(200 \times 10^9 \text{ Pa}) \times (0.016 \text{ m})^2}{2 \text{ m}} (0.0025 \text{ m} - 0.25\theta)$$

$$= 50.265 \times 10^3 - 5.0265 \times 10^6 \theta$$

$$\delta_B = \frac{P_{BE}L_{BE}}{E_{BE}A_{BE}} \quad \text{or} \quad P_{BE} = \frac{E_{BE}A_{BE}}{L_{BE}} \delta_B$$

$$P_{BE} = \frac{(200 \times 10^9 \text{ Pa}) \times (0.016 \text{ m})^2}{3 \text{ m}} (0.15\theta)$$

$$= 2.0106 \times 10^6 \theta$$

From free body of member $ABC$:

$$\sum M_A = 0 : \quad 0.15P_{BE} - 0.25P_{CD} = 0$$

$$0.15(2.0106 \times 10^6 \theta) - 0.25(50.265 \times 10^3 - 5.0265 \times 10^6 \theta) = 0$$

$$\theta = 8.0645 \times 10^{-3} \text{ rad}$$

($a$) $P_{CD} = 50.265 \times 10^3 - 5.0265 \times 10^6 (8.0645 \times 10^{-3})$

$$= 9.7288 \times 10^3 \text{ N} \quad P_{CD} = 9.73 \text{ kN} \quad \blacktriangle$$

($b$) $\delta_C = 0.25\theta = 0.25(8.0645 \times 10^{-3})$

$$= 2.0161 \times 10^{-3} \text{ m} \quad \delta_C = 2.02 \text{ mm} \quad \blacktriangleright$$
PROBLEM 2.46

Links BC and DE are both made of steel \((E = 29 \times 10^6 \text{ psi})\) and are \(\frac{1}{2}\) in. wide and \(\frac{1}{4}\) in. thick. Determine (a) the force in each link when a 600-lb force \(P\) is applied to the rigid member \(AF\) shown, (b) the corresponding deflection of point \(A\).

SOLUTION

Let the rigid member \(ACDF\) rotate through small angle \(\theta\) clockwise about point \(F\).

Then \(\delta_c = \delta_{BC} = 4\theta\) in. \(\rightarrow\)

\[
\delta_D = -\delta_{DE} = 2\theta \text{ in.} \rightarrow

For links:

\[
A = \left(\frac{1}{2}\right)\left(\frac{1}{4}\right) = 0.125 \text{ in}^2
\]

- \(L_{BC} = 4 \text{ in.}\)
- \(L_{DE} = 5 \text{ in.}\)

\[
F_{BC} = \frac{E A \delta_{BC}}{L_{BC}} = \frac{(29 \times 10^6)(0.125)(4\theta)}{4} = 3.625 \times 10^6 \theta

\[
F_{DE} = \frac{E A \delta_{DE}}{L_{DE}} = \frac{(29 \times 10^6)(0.125)(-2\theta)}{5} = -1.45 \times 10^6 \theta

Use member \(ACDF\) as a free body.

\[
\Sigma M_F = 0: \quad 8P - 4F_{BC} + 2F_{DE} = 0

\[
P = \frac{1}{2} F_{BC} - \frac{1}{4} F_{DE}

\[
600 = \frac{1}{2}(3.625 \times 10^6)\theta - \frac{1}{4}(-1.45 \times 10^6)\theta = 2.175 \times 10^6 \theta

\[

(b) \(F_{DE} = -(1.45 \times 10^6)(0.27586 \times 10^{-3})\)

\[
F_{DE} = -400 \text{ lb} \uparrow

(b) Deflection at Point \(A\).

\[
\delta_A = 8\theta = (8)(0.27586 \times 10^{-3})

PROBLEM 2.47

The concrete post \( E_c = 3.6 \times 10^6 \) psi and \( \alpha_c = 5.5 \times 10^{-6}/^\circ\text{F} \) is reinforced with six steel bars, each of \( \frac{7}{8}\)-in. diameter \( E_s = 29 \times 10^6 \) psi and \( \alpha_s = 6.5 \times 10^{-6}/^\circ\text{F} \). Determine the normal stresses induced in the steel and in the concrete by a temperature rise of 65°F.

SOLUTION

\[
A_s = \frac{\pi}{4} d^2 = \frac{\pi}{4} \left( \frac{7}{8} \right)^2 = 3.6079 \text{ in}^2
\]

\[
A_c = 10^2 - A_s = 10^2 - 3.6079 = 96.392 \text{ in}^2
\]

Let \( P_c \) = tensile force developed in the concrete.

For equilibrium with zero total force, the compressive force in the six steel rods equals \( P_c \).

Strains:

\[
\varepsilon_s = -\frac{P_c}{E_s A_s} + \alpha_s (\Delta T) \quad \varepsilon_c = -\frac{P_c}{E_c A_c} + \alpha_c (\Delta T)
\]

Matching:

\[
\varepsilon_c = \varepsilon_s \quad \frac{P_c}{E_c A_c} + \alpha_c (\Delta T) = -\frac{P_c}{E_s A_s} + \alpha_s (\Delta T)
\]

\[
\left( \frac{1}{E_c A_c} + \frac{1}{E_s A_s} \right) P_c = (\alpha_s - \alpha_c)(\Delta T)
\]

\[
\left[ \frac{1}{(3.6 \times 10^6)(96.392)} + \frac{1}{(29 \times 10^6)(3.6079)} \right] P_c = (1.0 \times 10^{-6})(65)
\]

\[
P_c = 5.2254 \times 10^5 \text{ lb}
\]

\[
\sigma_c = \frac{P_c}{A_c} = \frac{5.2254 \times 10^5}{96.392} = 54.210 \text{ psi}

\[
\sigma_s = -\frac{P_c}{A_s} = -\frac{5.2254 \times 10^5}{3.6079} = -1448.32 \text{ psi}

\[
\sigma_s = -1.448 \text{ ksi}

PROBLEM 2.48

The assembly shown consists of an aluminum shell \((E_a = 10.6 \times 10^6 \text{ psi}, \alpha_a = 12.9 \times 10^{-6}/\degree F)\) fully bonded to a steel core \((E_s = 29 \times 10^6 \text{ psi}, \alpha_s = 6.5 \times 10^{-6}/\degree F)\) and is unstressed. Determine \((a)\) the largest allowable change in temperature if the stress in the aluminum shell is not to exceed 6 ksi, \((b)\) the corresponding change in length of the assembly.

SOLUTION

Since \(\alpha_a > \alpha_s\), the shell is in compression for a positive temperature rise.

Let

\[
\sigma_a = -6 \text{ ksi} = -6 \times 10^3 \text{ psi}
\]

\[
A_a = \frac{\pi}{4} \left( d_a^2 - d_i^2 \right) = \frac{\pi}{4} (1.25^2 - 0.75^2) = 0.78540 \text{ in}^2
\]

\[
A_s = \frac{\pi}{4} d_i^2 = \frac{\pi}{4} (0.75)^2 = 0.44179 \text{ in}^2
\]

\[
P = -\sigma_a A_a = \sigma_s A_s
\]

where \(P\) is the tensile force in the steel core.

\[
\sigma_s = -\sigma_a \frac{A_a}{A_s} = \frac{(6 \times 10^3)(0.78540)}{0.44179} = 10.667 \times 10^3 \text{ psi}
\]

\[
\epsilon = \frac{\sigma_s}{E_s} + \alpha_s (\Delta T) = \frac{\sigma_s}{E_a} + \alpha_a (\Delta T)
\]

\[
(\alpha_a - \alpha_s)(\Delta T) = \frac{\sigma_s}{E_s} - \frac{\sigma_a}{E_a}
\]

\[
(6.4 \times 10^{-6})(\Delta T) = \frac{10.667 \times 10^3}{29 \times 10^6} + \frac{6 \times 10^3}{10.6 \times 10^6} = 0.93385 \times 10^{-3}
\]

\[
(a) \quad \Delta T = 145.91 \degree F \quad \Delta T = 145.9 \degree F
\]

\[
(b) \quad \epsilon = \frac{10.667 \times 10^3}{29 \times 10^6} + (6.5 \times 10^{-6})(145.91) = 1.3163 \times 10^{-3}
\]

or

\[
\epsilon = \frac{-6 \times 10^3}{10.6 \times 10^6} + (12.9 \times 10^{-6})(145.91) = 1.3163 \times 10^{-3}

PROBLEM 2.52

A steel railroad track \((E = 200 \text{ GPa}, \alpha = 11.7 \times 10^{-6}/^\circ\text{C})\) was laid out at a temperature of 6°C. Determine the normal stress in the rails when the temperature reaches 48°C, assuming that the rails \((a)\) are welded to form a continuous track, \((b)\) are 10 m long with 3-mm gaps between them.

SOLUTION

\((a)\)  
\[
\delta_T = \alpha(\Delta T)L = (11.7 \times 10^{-6})(48 - 6)(10) = 4.914 \times 10^{-3} \text{ m}
\]
\[
\delta_p = \frac{PL}{AE} = \frac{L\sigma}{E} = \frac{(10)\sigma}{200 \times 10^9} = 50 \times 10^{-12} \sigma
\]
\[
\delta = \delta_T + \delta_p = 4.914 \times 10^{-3} + 50 \times 10^{-12} \sigma = 0
\]
\[
\sigma = -98.3 \times 10^6 \text{ Pa}
\]
\[
\sigma = -98.3 \text{ MPa}
\]

\((b)\)  
\[
\delta = \delta_T + \delta_p = 4.914 \times 10^{-3} + 50 \times 10^{-12} \sigma = 3 \times 10^{-3}
\]
\[
\sigma = \frac{3 \times 10^{-3} - 4.914 \times 10^{-3}}{50 \times 10^{-12}}
\]
\[
= -38.3 \times 10^6 \text{ Pa}
\]
\[
\sigma = -38.3 \text{ MPa}
\]

PROBLEM 2.55

A brass link \((E_b = 105 \text{ GPa}, \alpha_b = 20.9 \times 10^{-6}/\text{°C})\) and a steel rod \((E_s = 200 \text{ GPa}, \alpha_s = 11.7 \times 10^{-6}/\text{°C})\) have the dimensions shown at a temperature of 20°C. The steel rod is cooled until it fits freely into the link. The temperature of the whole assembly is then raised to 45°C. Determine \(a\) the final stress in the steel rod, \(b\) the final length of the steel rod.

SOLUTION

Initial dimensions at \(T = 20 \text{ °C}\).

Final dimensions at \(T = 45 \text{ °C}\).

\[\Delta T = 45 - 20 = 25 \text{ °C}\]

Free thermal expansion of each part:

Brass link: \((\delta_T)_b = \alpha_b (\Delta T)L = (20.9 \times 10^{-6})(25)(0.250) = 130.625 \times 10^{-6} \text{ m}\)

Steel rod: \((\delta_T)_s = \alpha_s (\Delta T)L = (11.7 \times 10^{-6})(25)(0.250) = 73.125 \times 10^{-6} \text{ m}\)

At the final temperature, the difference between the free length of the steel rod and the brass link is

\[\delta = 120 \times 10^{-6} + 73.125 \times 10^{-6} - 130.625 \times 10^{-6} = 62.5 \times 10^{-6} \text{ m}\]

Add equal but opposite forces \(P\) to elongate the brass link and contract the steel rod.

Brass link: \(E = 105 \times 10^9 \text{ Pa}\)

\[A_b = (2)(50)(37.5) = 3750 \text{ mm}^2 = 3.750 \times 10^{-3} \text{ m}^2\]

\[(\delta_T)_b = \frac{PL}{EA} = \frac{P(0.250)}{(105 \times 10^9)(3.750 \times 10^{-3})} = 634.92 \times 10^{-12} \text{ P}\]

Steel rod: \(E = 200 \times 10^9 \text{ Pa}\)

\[A_s = \frac{\pi}{4}(30)^2 = 706.86 \text{ mm}^2 = 706.86 \times 10^{-6} \text{ m}^2\]

\[(\delta_T)_s = \frac{PL}{E_s A_s} = \frac{P(0.250)}{(200 \times 10^9)(706.86 \times 10^{-6})} = 1.76838 \times 10^{-9} \text{ P}\]

\[(\delta_T)_b + (\delta_T)_s = \delta: \quad 2.4033 \times 10^{-9} \text{ P} = 62.5 \times 10^{-6} \text{ P} = 26.006 \times 10^3 \text{ N}\]

(a) Stress in steel rod:

\[\sigma_s = -\frac{P}{A_s} = -\frac{(26.006 \times 10^3)}{706.86 \times 10^{-6}} = -36.8 \times 10^6 \text{ Pa} \quad \sigma_s = -36.8 \text{ MPa}\]

(b) Final length of steel rod:

\[L_f = L_0 + (\delta_T)_s - (\delta_T)_b\]

\[L_f = 0.250 + 120 \times 10^{-6} + 73.125 \times 10^{-6} - (1.76838 \times 10^{-9})(26.003 \times 10^3)\]

\[= 0.250147 \text{ m}\]

\[L_f = 250.147 \text{ mm}\]
PROBLEM 2.56

Two steel bars \((E_s = 200 \text{ GPa} \text{ and } \alpha_s = 11.7 \times 10^{-6}/\degree \text{C})\) are used to reinforce a brass bar \((E_b = 105 \text{ GPa} \text{, } \alpha_b = 20.9 \times 10^{-6}/\degree \text{C})\) that is subjected to a load \(P = 25 \text{ kN}\). When the steel bars were fabricated, the distance between the centers of the holes that were to fit on the pins was made 0.5 mm smaller than the 2 m needed. The steel bars were then placed in an oven to increase their length so that they would just fit on the pins. Following fabrication, the temperature in the steel bars dropped back to room temperature. Determine (a) the increase in temperature that was required to fit the steel bars on the pins, (b) the stress in the brass bar after the load is applied to it.

SOLUTION

(a) Required temperature change for fabrication:

\[
\delta_T = 0.5 \text{ mm} = 0.5 \times 10^{-3} \text{ m}
\]

Temperature change required to expand steel bar by this amount:

\[
\delta_T = L \alpha_s \Delta T, \quad 0.5 \times 10^{-3} = (2.00)(11.7 \times 10^{-6})(\Delta T),
\]

\[
\Delta T = 0.5 \times 10^{-3} = (2)(11.7 \times 10^{-6})(\Delta T)
\]

\[
\Delta T = 21.368 \degree \text{C}
\]

(b) Once assembled, a tensile force \(P^s\) develops in the steel, and a compressive force \(P^b\) develops in the brass, in order to elongate the steel and contract the brass.

Elongation of steel:

\[
A_s = (2)(5)(40) = 400 \text{ mm}^2 = 400 \times 10^{-6} \text{ m}^2
\]

\[
(\delta_p)_s = \frac{F^s L}{A_s E_s} = \frac{P^s (2.00)}{(400 \times 10^{-6})(200 \times 10^9)} = 25 \times 10^{-9} P^s
\]

Contraction of brass:

\[
A_b = (40)(15) = 600 \text{ mm}^2 = 600 \times 10^{-6} \text{ m}^2
\]

\[
(\delta_p)_b = \frac{F^b L}{A_b E_b} = \frac{P^b (2.00)}{(600 \times 10^{-6})(105 \times 10^9)} = 31.746 \times 10^{-9} P^b
\]

But \((\delta_p)_s + (\delta_p)_b\) is equal to the initial amount of misfit:

\[
(\delta_p)_s + (\delta_p)_b = 0.5 \times 10^{-3}, \quad 56.746 \times 10^{-9} P^s = 0.5 \times 10^{-3}
\]

\[
P^s = 8.811 \times 10^3 \text{ N}
\]

Stresses due to fabrication:

Steel:

\[
\sigma_s^* = \frac{P^s}{A_s} = \frac{8.811 \times 10^3}{400 \times 10^{-6}} = 22.03 \times 10^6 \text{ Pa} = 22.03 \text{ MPa}
\]
PROBLEM 2.56 (Continued)

Brass: \[ \sigma_b^* = \frac{P_b^*}{A_b} = \frac{8.811 \times 10^3}{600 \times 10^{-6}} = -14.68 \times 10^6 \text{ Pa} = -14.68 \text{ MPa} \]

To these stresses must be added the stresses due to the 25 kN load.

For the added load, the additional deformation is the same for both the steel and the brass. Let \( \delta' \) be the additional displacement. Also, let \( P_s \) and \( P_b \) be the additional forces developed in the steel and brass, respectively.

\[
\delta' = \frac{P_s L}{A_s E_s} = \frac{P_b L}{A_b E_b}
\]

\[
P_s = \frac{A_s E_s}{L} \delta' = \frac{(400 \times 10^6)(200 \times 10^9)}{2.00} \delta' = 40 \times 10^6 \delta'
\]

\[
P_b = \frac{A_b E_b}{L} \delta' = \frac{(600 \times 10^6)(105 \times 10^9)}{2.00} \delta' = 31.5 \times 10^6 \delta'
\]

Total

\[
P = P_s + P_b = 25 \times 10^3 \text{ N}
\]

\[
40 \times 10^6 \delta' + 31.5 \times 10^6 \delta' = 25 \times 10^3 \quad \delta' = 349.65 \times 10^{-6} \text{ m}
\]

\[
P_s = (40 \times 10^6)(349.65 \times 10^{-6}) = 13.986 \times 10^3 \text{ N}
\]

\[
P_b = (31.5 \times 10^6)(349.65 \times 10^{-6}) = 11.140 \times 10^3 \text{ N}
\]

\[
\sigma_s = \frac{P_s}{A_s} = \frac{13.986 \times 10^3}{400 \times 10^{-6}} = 34.97 \times 10^6 \text{ Pa}
\]

\[
\sigma_b = \frac{P_b}{A_b} = \frac{11.140 \times 10^3}{600 \times 10^{-6}} = 18.36 \times 10^6 \text{ Pa}
\]

Add stress due to fabrication.

Total stresses:

\[
\sigma_s = 34.97 \times 10^6 + 22.03 \times 10^6 = 57.0 \times 10^6 \text{ Pa} \quad \sigma_s = 57.0 \text{ MPa}
\]

\[
\sigma_b = 18.36 \times 10^6 - 14.68 \times 10^6 = 3.68 \times 10^6 \text{ Pa} \quad \sigma_b = 3.68 \text{ MPa}
\]
**PROBLEM 2.57**

Determine the maximum load $P$ that may be applied to the brass bar of Prob. 2.56 if the allowable stress in the steel bars is 30 MPa and the allowable stress in the brass bar is 25 MPa.

**PROBLEM 2.56** Two steel bars ($E_s = 200$ GPa and $\alpha_s = 11.7 \times 10^{-6}/\degree C$) are used to reinforce a brass bar ($E_b = 105$ GPa, $\alpha_b = 20.9 \times 10^{-6}/\degree C$) that is subjected to a load $P = 25$ kN. When the steel bars were fabricated, the distance between the centers of the holes that were to fit on the pins was made 0.5 mm smaller than the 2 m needed. The steel bars were then placed in an oven to increase their length so that they would just fit on the pins. Following fabrication, the temperature in the steel bars dropped back to room temperature. Determine (a) the increase in temperature that was required to fit the steel bars on the pins, (b) the stress in the brass bar after the load is applied to it.

**SOLUTION**

See solution to Problem 2.56 to obtain the fabrication stresses.

$\sigma_s^* = 22.03$ MPa

$\sigma_b^* = 14.68$ MPa

Allowable stresses: $\sigma_{s,all} = 30$ MPa, $\sigma_{b,all} = 25$ MPa

Available stress increase from load.

$\sigma_s = 30 - 22.03 = 7.97$ MPa

$\sigma_b = 25 + 14.68 = 39.68$ MPa

Corresponding available strains.

$\varepsilon_s = \frac{\sigma_s}{E_s} = \frac{7.97 \times 10^6}{200 \times 10^9} = 39.85 \times 10^{-6}$

$\varepsilon_b = \frac{\sigma_b}{E_b} = \frac{39.68 \times 10^6}{105 \times 10^9} = 377.9 \times 10^{-6}$

Smaller value governs $\therefore \varepsilon = 39.85 \times 10^{-6}$

Areas: $A_s = (2)(5)(40) = 400$ mm$^2 = 400 \times 10^{-6}$ m$^2$

$A_b = (15)(40) = 600$ mm$^2 = 600 \times 10^{-6}$ m$^2$

Forces $P_s = E_s A_s \varepsilon = (200 \times 10^9)(400 \times 10^{-6})(39.85 \times 10^{-6}) = 3.188 \times 10^3$ N

$P_b = E_b A_b \varepsilon = (105 \times 10^9)(600 \times 10^{-6})(39.85 \times 10^{-6}) = 2.511 \times 10^3$ N

Total allowable additional force:

$P = P_s + P_b = 3.188 \times 10^3 + 2.511 \times 10^3 = 5.70 \times 10^3$ N

$P = 5.70$ kN
PROBLEM 2.58

Knowing that a 0.02-in. gap exists when the temperature is 75°F, determine (a) the temperature at which the normal stress in the aluminum bar will be equal to \(-11\) ksi, (b) the corresponding exact length of the aluminum bar.

SOLUTION

\[ \sigma_a = -11 \text{ ksi} = -11 \times 10^3 \text{psi} \]
\[ P = -\sigma_a A_a = (11 \times 10^3)(2.8) = 30.8 \times 10^3 \text{lb} \]

Shortening due to \(P\):

\[ \delta_p = \frac{PL_{b_a}}{E_b A_b} + \frac{PL_{a_a}}{E_a A_a} \]
\[ = \frac{(30.8 \times 10^3)(14)}{(15 \times 10^6)(2.4)} + \frac{(30.8 \times 10^3)(18)}{(10.6 \times 10^6)(2.8)} \]
\[ = 30.657 \times 10^{-3} \text{in.} \]

Available elongation for thermal expansion:

\[ \delta_T = 0.02 + 30.657 \times 10^{-3} = 50.657 \times 10^{-3} \text{in.} \]

But \(\delta_T = L_b \alpha_b (\Delta T) + L_a \alpha_a (\Delta T)\)
\[ = (14)(12 \times 10^{-6})(\Delta T) + (18)(12.9 \times 10^{-6})(\Delta T) = 400.2 \times 10^{-6} \Delta T \]

Equating, \(400.2 \times 10^{-6} \Delta T = 50.657 \times 10^{-3}\)
\[ \Delta T = 126.6 \degree \text{F} \]

(a) \(T_{\text{hot}} = T_{\text{cold}} + \Delta T = 75 + 126.6 = 201.6 \degree \text{F}\)
\(T_{\text{hot}} = 201.6 \degree \text{F} \)

(b) \(\delta_a = L_a \alpha_a (\Delta T) - \frac{PL_{a_a}}{E_a A_a}\)
\[ = (18)(12.9 \times 10^{-6})(26.6) - \frac{(30.8 \times 10^3)(18)}{(10.6 \times 10^6)(2.8)} = 10.712 \times 10^{-3} \text{in.} \]
\[ L_{\text{exact}} = 18 + 10.712 \times 10^{-3} = 18.0107 \text{in.} \]
\(L = 18.0107 \text{in.} \)
PROBLEM 2.59

Determine \((a)\) the compressive force in the bars shown after a temperature rise of 180°F, \((b)\) the corresponding change in length of the bronze bar.

**SOLUTION**

Thermal expansion if free of constraint:

\[
\delta_T = L_b \alpha_b (\Delta T) + L_a \alpha_a (\Delta T)
\]

\[
= (14)(12 \times 10^{-6})(180) + (18)(12.9 \times 10^{-6})(180)
\]

\[
= 72.036 \times 10^{-3} \text{ in.}
\]

Constrained expansion: \(\delta = 0.02 \text{ in.}\)

Shortening due to induced compressive force \(P\):

\[
\delta_p = 72.036 \times 10^{-3} - 0.02 = 52.036 \times 10^{-3} \text{ in.}
\]

But

\[
\delta_p = \frac{PL_b}{E_b A_b} + \frac{PL_a}{E_a A_a} = \left( \frac{L_b}{E_b A_b} + \frac{L_a}{E_a A_a} \right) P
\]

\[
= \left( \frac{14}{(15 \times 10^6)(2.4)} + \frac{18}{(10.6 \times 10^6)(2.8)} \right) P = 995.36 \times 10^{-9} P
\]

Equating,

\[
995.36 \times 10^{-9} P = 52.036 \times 10^{-3}
\]

\(P = 52.279 \times 10^3 \text{ lb}\)

\((a)\)

\(P = 52.3 \text{ kips}\)

</tbody>
</table>

**SOLUTION**

\[ \Delta T = 140 - 20 = 120°C \]

Free thermal expansion:

\[ \delta_T = L_a \alpha_a (\Delta T) + L_s \alpha_s (\Delta T) \]
\[ = (0.300)(23 \times 10^{-6})(120) + (0.250)(17.3 \times 10^{-6})(120) \]
\[ = 1.347 \times 10^{-3} \text{ m} \]

Shortening due to \( P \) to meet constraint:

\[ \delta_P = 1.347 \times 10^{-3} - 0.5 \times 10^{-3} = 0.847 \times 10^{-3} \text{ m} \]

\[ \delta_P = \frac{PL_a}{E_a A_a} + \frac{PL_s}{E_s A_s} \left( \frac{L_a}{E_a A_a} + \frac{L_s}{E_s A_s} \right) P \]
\[ = \left( \frac{0.300}{(75 \times 10^9)(2000 \times 10^{-6})} + \frac{0.250}{(190 \times 10^9)(800 \times 10^{-6})} \right) P \]
\[ = 3.6447 \times 10^{-9} P \]

Equating,

\[ 3.6447 \times 10^{-9} P = 0.847 \times 10^{-3} \]
\[ P = 232.39 \times 10^3 \text{ N} \]

(a) \[ \sigma_a = - \frac{P}{A_a} = - \frac{232.39 \times 10^3}{2000 \times 10^{-6}} = -116.2 \times 10^6 \text{ Pa} \]
\[ \sigma_a = -116.2 \text{ MPa} \]

(b) \[ \delta_a = L_a \alpha_a (\Delta T) - \frac{PL_a}{E_a A_a} \]
\[ = (0.300)(23 \times 10^{-6})(120) - \frac{(232.39 \times 10^3)(0.300)}{(75 \times 10^9)(2000 \times 10^{-6})} \]
\[ = 363 \times 10^{-6} \text{ m} \]

A 600-lb tensile load is applied to a test coupon made from $\frac{1}{16}$-in. flat steel plate ($E = 29 \times 10^6$ psi and $\nu = 0.30$). Determine the resulting change ($a$) in the 2-in. gage length, ($b$) in the width of portion $AB$ of the test coupon, ($c$) in the thickness of portion $AB$, ($d$) in the cross-sectional area of portion $AB$.

**SOLUTION**

$$A = \left(\frac{1}{2}\right)\left(\frac{1}{16}\right) = 0.03125 \text{ in}^2$$

$$\sigma = \frac{P}{A} = \frac{600}{0.03125} = 19.2 \times 10^3 \text{ psi}$$

$$\varepsilon_x = \frac{\sigma}{E} = \frac{19.2 \times 10^3}{29 \times 10^6} = 662.07 \times 10^{-6}$$

($a$) \( \delta_x = L_0 \varepsilon_x = (2.0)(662.07 \times 10^{-6}) \) \( \delta_y = 1.324 \times 10^{-3} \text{ in.} \)

In a standard tensile test, a steel rod of 22-mm diameter is subjected to a tension force of 75 kN. Knowing that \( v = 0.3 \) and \( E = 200 \text{ GPa} \), determine (a) the elongation of the rod in a 200-mm gage length, (b) the change in diameter of the rod.

SOLUTION

\[
P = 75 \text{ kN} = 75 \times 10^3 \text{ N}
\]

\[
A = \frac{\pi}{4} d^2 = \frac{\pi}{4} (0.022)^2 = 380.13 \times 10^{-6} \text{ m}^2
\]

\[
\sigma = \frac{P}{A} = \frac{75 \times 10^3}{380.13 \times 10^{-6}} = 197.301 \times 10^6 \text{ Pa}
\]

\[
\varepsilon_x = \frac{\sigma}{E} = \frac{197.301 \times 10^6}{200 \times 10^9} = 986.51 \times 10^{-6}
\]

\[
\delta_x = L \varepsilon_x = (200 \text{ mm})(986.51 \times 10^{-6})
\]

(a) \( \delta_x = 0.1973 \text{ mm} \)

\[
\varepsilon_y = -v \varepsilon_x = -(0.3)(986.51 \times 10^{-6}) = -295.95 \times 10^{-6}

A 20-mm-diameter rod made of an experimental plastic is subjected to a tensile force of magnitude \( P = 6 \text{ kN} \). Knowing that an elongation of 14 mm and a decrease in diameter of 0.85 mm are observed in a 150-mm length, determine the modulus of elasticity, the modulus of rigidity, and Poisson’s ratio for the material.

**SOLUTION**

Let the \( y \)-axis be along the length of the rod and the \( x \)-axis be transverse.

\[
A = \frac{\pi}{4} (20)^2 = 314.16 \text{ mm}^2 = 314.16 \times 10^{-6} \text{ m}^2 \quad P = 6 \times 10^3 \text{ N}
\]

\[
\sigma_y = \frac{P}{A} = \frac{6 \times 10^3}{314.16 \times 10^{-6}} = 19.0985 \times 10^6 \text{ Pa}
\]

\[
\varepsilon_y = \frac{\delta_y}{L} = \frac{14 \text{ mm}}{150 \text{ mm}} = 0.093333
\]

**Modulus of elasticity:**

\[
E = \frac{\sigma_y}{\varepsilon_y} = \frac{19.0985 \times 10^6}{0.093333} = 204.63 \times 10^6 \text{ Pa} \quad E = 205 \text{ MPa}
\]

\[
E_x = \frac{\delta_x}{d} = \frac{0.85}{20} = -0.0425
\]

**Poisson’s ratio:**

\[
\nu = -\frac{\varepsilon_x}{\varepsilon_y} = -\frac{-0.0425}{0.093333} = 0.455
\]

**Modulus of rigidity:**

\[
G = \frac{E}{2(1 + \nu)} = \frac{204.63 \times 10^6}{(2)(1.455)} = 70.31 \times 10^6 \text{ Pa} \quad G = 70.3 \text{ MPa}

The change in diameter of a large steel bolt is carefully measured as the nut is tightened. Knowing that $E = 29 \times 10^6$ psi and $v = 0.30$, determine the internal force in the bolt, if the diameter is observed to decrease by $0.5 \times 10^{-3}$ in.

SOLUTION

$\delta_y = -0.5 \times 10^{-3}$ in. $d = 2.5$ in.

$\epsilon_y = \frac{\delta_y}{d} = -\frac{0.5 \times 10^{-3}}{2.5} = -0.2 \times 10^{-3}$

$v = \frac{\epsilon_y}{\epsilon_x}$; $\epsilon_x = \frac{-\epsilon_y}{v} = \frac{0.2 \times 10^{-3}}{0.3} = 0.66667 \times 10^{-3}$

$\sigma_x = E\epsilon_x = (29 \times 10^6)(0.66667 \times 10^{-3}) = 19.3334 \times 10^3$ psi

$A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(2.5)^2 = 4.9087$ in$^2$

$F = \sigma_x A = (19.3334 \times 10^3)(4.9087) = 94.902 \times 10^3$ lb

Knowing that $E = 200 \text{ GPa}$ and $v = 0.30$, determine (a) the change in length of the pipe, (b) the change in its outer diameter, (c) the change in its wall thickness.

**SOLUTION**

(a) $d_o = 0.3 \text{ m} \quad t = 0.015 \text{ m} \quad L = 2.5 \text{ m}$

$b_o = d_o - 2t = 0.3 - 2(0.015) = 0.27 \text{ m} \quad P = 700 \times 10^3 \text{ N}$

$A = \frac{\pi}{4}(d_o^2 - d_i^2) = \frac{\pi}{4}(0.3^2 - 0.27^2) = 13.4303 \times 10^{-3} \text{ m}^2$

$\delta = \frac{PL}{EA} = \frac{(700 \times 10^3)(2.5)}{(200 \times 10^9)(13.4303 \times 10^{-3})}$

$\delta = -651.51 \times 10^{-6} \text{ m} \quad \delta = -0.652 \text{ mm}$

$\varepsilon = \frac{\delta}{L} = \frac{-651.51 \times 10^{-6}}{2.5} = -260.60 \times 10^{-6}$

SOLUTION

The slope after deformation is

\[

**SOLUTION**

(a) $\delta_y = 0 \quad \varepsilon_y = 0 \quad \sigma_z = 0$

$$\varepsilon_y = \frac{1}{E}(\sigma_x - v\sigma_y - v\sigma_z)$$

$$\varepsilon_x = \frac{1}{E}(\sigma_x - v\sigma_y - v\sigma_z) = \frac{\sigma_z - v\sigma_y}{E} = \frac{157.95 \times 10^6}{45 \times 10^9} = -3.51 \times 10^{-3}$$

$$\Delta V = V - V_0 = L_x L_y L_z (\varepsilon_x + \varepsilon_y + \varepsilon_z + \text{small terms})$$

$$\Delta V = (100)(40)(25)(-3.51 \times 10^{-3} + 0 - 1.89 \times 10^{-3})$$

**PROBLEM 2.68**

A 30-mm square was scribed on the side of a large steel pressure vessel. After pressurization, the biaxial stress condition at the square is as shown. For $E = 200$ GPa and $v = 0.30$, determine the change in length of (a) side $AB$, (b) side $BC$, (c) diagonal $AC$.

**SOLUTION**

Given: $\sigma_x = 80$ MPa, $\sigma_y = 40$ MPa

Using Eq’s (2.28):

\[ \varepsilon_x = \frac{1}{E} (\sigma_x - v\sigma_y) = \frac{80 - 0.3(40)}{200 \times 10^3} = 340 \times 10^{-6} \]

\[ \varepsilon_y = \frac{1}{E} (\sigma_y - v\sigma_x) = \frac{40 - 0.3(80)}{200 \times 10^3} = 80 \times 10^{-6} \]

(a) Change in length of $AB$.

\[ \delta_{AB} = (AB)\varepsilon_x = (30 \text{ mm})(340 \times 10^{-6}) = 10.20 \times 10^{-3} \text{ mm} \]

\[ \delta_{AB} = 10.20 \mu m \]

(b) Change in length of $BC$.

\[ \delta_{BC} = (BC)\varepsilon_y = (30 \text{ mm})(80 \times 10^{-6}) = 2.40 \times 10^{-3} \text{ mm} \]

\[ \delta_{BC} = 2.40 \mu m \]

(c) Change in length of diagonal $AC$.

From geometry, $(AC)^2 = (AB)^2 + (BC)^2$

Differentiate:

\[ 2(AC) \Delta(AC) = 2(AB)\Delta(AB) + 2(BC)\Delta(BC) \]

But

\[ \Delta(AC) = \delta_{AC}, \quad \Delta(AB) = \delta_{AB}, \quad \Delta(BC) = \delta_{BC} \]

Thus,

\[ 2(AC)\delta_{AC} = 2(AB)\delta_{AB} + 2(BC)\delta_{BC} \]

\[ \delta_{AC} = \frac{AB}{AC}\delta_{AB} + \frac{BC}{AC}\delta_{BC} = \frac{1}{\sqrt{2}}(10.20 \mu m) + \frac{1}{\sqrt{2}}(2.40 \mu m) \]

\[ \delta_{AC} = 8.91 \mu m \]

Knowing that $E = 10.1 \times 10^6$ psi and $v = 0.36$, determine $(a)$ the change in the total length $AD$, $(b)$ the change in diameter at the middle of the rod.

SOLUTION

\[ \sigma_x = \sigma_z = -P = -6000 \text{ psi} \quad \sigma_y = 0 \]

\[ \varepsilon_x = \frac{1}{E}(\sigma_x - v\sigma_y - v\sigma_z) \]

PROBLEM 2.70

For the rod of Prob. 2.69, determine the forces that should be applied to the ends A and D of the rod (a) if the axial strain in portion BC of the rod is to remain zero as the hydrostatic pressure is applied, (b) if the total length AD of the rod is to remain unchanged.

PROBLEM 2.69

The aluminum rod AD is fitted with a jacket that is used to apply a hydrostatic pressure of 6000 psi to the 12-in. portion BC of the rod. Knowing that $E = 10.1 \times 10^6$ psi and $\nu = 0.36$, determine (a) the change in the total length AD, (b) the change in diameter at the middle of the rod.

SOLUTION

Over the pressurized portion BC,

$$\sigma_x = \sigma_z = -p \quad \sigma_y = \sigma_y$$

$$(\varepsilon_y)_{BC} = \frac{1}{E} (-\nu \sigma_x + \sigma_y - \nu \sigma_z)$$

$$(a) \quad (\varepsilon_y)_{BC} = 0 \quad 2\nu p + \sigma_y = 0$$

$$\sigma_y = -2\nu p = -(2)(0.36)(6000)$$

$$= -4320 \text{ psi}$$

$$A = \frac{\pi}{4} d^2 = \frac{\pi}{4} (1.5)^2 = 1.76715 \text{ in}^2$$

$$F = A\sigma_y = (1.76715)(-4320) = -7630 \text{ lb}$$

i.e., 7630 lb compression

$$(b) \quad \text{Over unpressurized portions AB and CD,} \quad \sigma_x = \sigma_z = 0$$

$$(\varepsilon_y)_{AB} = (\varepsilon_y)_{CD} = \frac{\sigma_y}{E}$$

For no change in length,

$$\delta = L_{AB}(\varepsilon_y)_{AB} + L_{BC}(\varepsilon_y)_{BC} + L_{CD}(\varepsilon_y)_{CD} = 0$$

$$(L_{AB} + L_{CD})(\varepsilon_y)_{AB} + L_{BC}(\varepsilon_y)_{BC} = 0$$

$$(20 - 12)\frac{\sigma_y}{E} + \frac{12}{E} (2\nu p + \sigma_y) = 0$$

$$\sigma_y = \frac{24\nu p}{20} = \frac{-(24)(0.36)(6000)}{20} = -2592 \text{ psi}$$

$$P = A\sigma_y = (1.76715)(-2592) = -4580 \text{ lb}$$

P = 4580 lb compression
PROBLEM 2.71

In many situations, physical constraints prevent strain from occurring in a given direction. For example, $\varepsilon_z = 0$ in the case shown, where longitudinal movement of the long prism is prevented at every point. Plane sections perpendicular to the longitudinal axis remain plane and the same distance apart. Show that for this situation, which is known as plane strain, we can express $\sigma_z$, $\varepsilon_x$, and $\varepsilon_y$ as follows:

$$\sigma_z = v(\sigma_x + \sigma_y)$$

$$\varepsilon_x = \frac{1}{E}[\varepsilon_x - \varepsilon_z - v(\varepsilon_x + \varepsilon_y)]$$

$$\varepsilon_y = \frac{1}{E}[\varepsilon_y - \varepsilon_z - v(\varepsilon_x + \varepsilon_y)]$$

SOLUTION

$$\varepsilon_z = 0 = \frac{1}{E}(-v\sigma_x - v\sigma_y + \varepsilon_z) \text{ or } \sigma_z = v(\sigma_x + \sigma_y)$$

$$\varepsilon_x = \frac{1}{E}(\sigma_x - \sigma_y - v\sigma_z)$$

$$= \frac{1}{E}[\sigma_x - \sigma_y - v^2(\sigma_x + \sigma_y)]$$

$$= \frac{1}{E}[(1 - v^2)\sigma_x - v(1 + v)\sigma_y]$$

$$\varepsilon_y = \frac{1}{E}(-v\sigma_x + \sigma_y - v\sigma_z)$$

$$= \frac{1}{E}[-v\sigma_x + \sigma_y - v^2(\sigma_x + \sigma_y)]$$

$$= \frac{1}{E}[(1 - v^2)\sigma_y - v(1 + v)\sigma_x]$$

In many situations, it is known that the normal stress in a given direction is zero, for example, \( \sigma_z = 0 \) in the case of the thin plate shown. For this case, which is known as plane stress, show that if the strains \( \varepsilon_x \) and \( \varepsilon_y \) have been determined experimentally, we can express \( \sigma_x \), \( \sigma_y \), and \( \varepsilon_z \) as follows:

\varepsilon_y = \frac{1}{E} (-\nu \sigma_x + \sigma_y) \quad (2)
\]

Multiplying (2) by \( \nu \) and adding to (1),

\[
\varepsilon_x + \nu \varepsilon_y = \frac{1 - \nu^2}{E} \sigma_x \quad \text{or} \quad \sigma_x = \frac{E}{1 - \nu^2} (\varepsilon_x + \nu \varepsilon_y)
\]

Multiplying (1) by \( \nu \) and adding to (2),

\[
\varepsilon_y + \nu \varepsilon_x = \frac{1 - \nu^2}{E} \sigma_y \quad \text{or} \quad \sigma_y = \frac{E}{1 - \nu^2} (\varepsilon_y + \nu \varepsilon_x)
\]

\[
\varepsilon_z = \frac{1}{E} (-\nu \sigma_x - \nu \sigma_y) = -\frac{\nu}{E} \frac{\sigma'}{1 - \nu^2} (\varepsilon_x + \nu \varepsilon_y + \varepsilon_y + \nu \varepsilon_x) = -\frac{\nu(1 + \nu)}{1 - \nu^2} (\varepsilon_x + \varepsilon_y) = -\frac{\nu}{1 - \nu} (\varepsilon_x + \varepsilon_y)

PROBLEM 2.73

For a member under axial loading, express the normal strain $\varepsilon'$ in a direction forming an angle of $45^\circ$ with the axis of the load in terms of the axial strain $\varepsilon_x$ by (a) comparing the hypotenuses of the triangles shown in Fig. 2.49, which represent, respectively, an element before and after deformation, (b) using the values of the corresponding stresses of $\sigma'$ and $\sigma_x$ shown in Fig. 1.38, and the generalized Hooke's law.

SOLUTION

\begin{align*}
\text{(a)} \quad \sqrt{2}(1 + \varepsilon')^2 &= (1 + \varepsilon_x)^2 + (1 - \nu\varepsilon_x)^2 \\
2(1 + 2\varepsilon' + \varepsilon'^2) &= 1 + 2\varepsilon_x + \varepsilon_x^2 + 1 - 2\nu\varepsilon_x + \nu^2\varepsilon_x^2 \\
4\varepsilon' + 2\varepsilon'^2 &= 2\varepsilon_x + \varepsilon_x^2 - 2\nu\varepsilon_x + \nu^2\varepsilon_x^2
\end{align*}

Neglect squares as small

\begin{align*}
4\varepsilon' &= 2\varepsilon_x - 2\nu\varepsilon_x \\
\varepsilon' &= \frac{1 - \nu}{2} \varepsilon_x
\end{align*}
PROBLEM 2.73 (Continued)

(b) \( \varepsilon' = \frac{\sigma'}{E} - \frac{v \sigma'}{E} = \frac{1 - v}{2} \frac{P}{E} = \frac{1 - v}{2E} \sigma_x = \frac{1 - v}{2} \varepsilon_x \)
PROBLEM 2.74

The homogeneous plate $ABCD$ is subjected to a biaxial loading as shown. It is known that $\sigma_z = \sigma_0$ and that the change in length of the plate in the $x$ direction must be zero, that is, $\varepsilon_x = 0$. Denoting by $E$ the modulus of elasticity and by $\nu$ Poisson’s ratio, determine (a) the required magnitude of $\sigma_x$, (b) the ratio $\sigma_0 / \varepsilon_z$.

SOLUTION

\[
\sigma_z = \sigma_0, \quad \sigma_y = 0, \quad \varepsilon_x = 0
\]

\[
\varepsilon_x = \frac{1}{E} (\sigma_x - \nu \sigma_y - \nu \sigma_z) = \frac{1}{E} (\sigma_x - \nu \sigma_0)
\]

(a) $\sigma_x = \nu \sigma_0 \blacktriangle$

\[
\varepsilon_z = \frac{1}{E} (-\nu \sigma_x - \nu \sigma_y + \sigma_z) = \frac{1}{E} (-\nu^2 \sigma_0 - 0 + \sigma_0) = \frac{1 - \nu^2}{E} \sigma_0
\]

(b) $\varepsilon_z = \frac{\sigma_0}{1 - \nu^2} \blacktriangle$

\[
\frac{\sigma_0}{\varepsilon_z} = \frac{E}{1 - \nu^2}
\]

A vibration isolation unit consists of two blocks of hard rubber bonded to a plate $AB$ and to rigid supports as shown. Knowing that a force of magnitude $P = 25 \text{kN}$ causes a deflection $\delta = 1.5 \text{ mm}$ of plate $AB$, determine the modulus of rigidity of the rubber used.

\[ F = \frac{1}{2} P = \frac{1}{2} (25 \times 10^3 \text{ N}) = 12.5 \times 10^3 \text{ N} \]
\[ \tau = \frac{F}{A} = \frac{12.5 \times 10^3 \text{ N}}{(0.15 \text{ m})(0.1 \text{ m})} = 833.33 \times 10^3 \text{ Pa} \]
\[ \delta = 1.5 \times 10^{-3} \text{ m} \quad h = 0.03 \text{ m} \]
\[ \gamma = \frac{\delta}{h} = \frac{1.5 \times 10^{-3}}{0.03} = 0.05 \]
\[ G = \frac{\tau}{\gamma} = \frac{833.33 \times 10^3}{0.05} = 16.67 \times 10^6 \text{ Pa} \]

\[ G = 16.67 \text{ MPa} \]
**PROBLEM 2.76**

A vibration isolation unit consists of two blocks of hard rubber with a modulus of rigidity \( G = 19 \text{ MPa} \) bonded to a plate \( AB \) and to rigid supports as shown. Denoting by \( P \) the magnitude of the force applied to the plate and by \( \delta \) the corresponding deflection, determine the effective spring constant, \( k = P/\delta \), of the system.

**SOLUTION**

Shearing strain: \( \gamma = \frac{\delta}{h} \)

Shearing stress: \( \tau = G\gamma = \frac{G\delta}{h} \)

Force: \( \frac{1}{2}P = A\tau = \frac{GAd}{h} \quad \text{or} \quad P = \frac{2GAd}{h} \)

Effective spring constant: \( k = \frac{P}{\delta} = \frac{2Ga}{h} \)

with \( A = (0.15)(0.1) = 0.015 \text{ m}^2 \quad h = 0.03 \text{ m} \)

\[
k = \frac{2(19 \times 10^6 \text{ Pa})(0.015 \text{ m}^2)}{0.03 \text{ m}} = 19.00 	imes 10^6 \text{ N/m}
\]

\[
k = 19.00 \times 10^3 \text{ kN/m} \]

PROBLEM 2.77

The plastic block shown is bonded to a fixed base and to a horizontal rigid plate to which a force $P$ is applied. Knowing that for the plastic used $G = 55$ ksi, determine the deflection of the plate when $P = 9$ kips.

SOLUTION

Consider the plastic block. The shearing force carried is $P = 9 \times 10^3$ lb

The area is $A = (3.5)(5.5) = 19.25$ in$^2$

Shearing stress: $\tau = \frac{P}{A} = \frac{9 \times 10^3}{19.25} = 467.52$ psi

Shearing strain: $\gamma = \frac{\tau}{G} = \frac{467.52}{55 \times 10^3} = 0.0085006$

But $\gamma = \frac{\delta}{h} \therefore \delta = h\gamma = (2.2)(0.0085006)$

$\delta = 0.187$ in.
PROBLEM 2.78

A vibration isolation unit consists of two blocks of hard rubber bonded to plate \( AB \) and to rigid supports as shown. For the type and grade of rubber used \( \tau_{\text{all}} = 220 \text{ psi} \) and \( G = 1800 \text{ psi} \). Knowing that a centric vertical force of magnitude \( P = 3.2 \text{ kips} \) must cause a 0.1-in. vertical deflection of the plate \( AB \), determine the smallest allowable dimensions \( a \) and \( b \) of the block.

SOLUTION

Consider the rubber block on the right. It carries a shearing force equal to \( \frac{1}{2} P \).

The shearing stress is \( \tau = \frac{1}{2} \frac{P}{A} \)

or required area \( A = \frac{P}{2\tau} = \frac{3.2 \times 10^3}{2(220)} = 7.2727 \text{ in}^2 \)

But \( A = (3.0)b \)

Hence, \( b = \frac{A}{3.0} = 2.42 \text{ in.} \)

Use \( b = 2.42 \text{ in.} \) and \( \tau = 220 \text{ psi} \)

Shearing strain, \( \gamma = \frac{\tau}{G} = \frac{220}{1800} = 0.12222 \)

But \( \gamma = \frac{\delta}{a} \)

Hence, \( a = \frac{\delta}{\gamma} = \frac{0.1}{0.12222} = 0.818 \text{ in.} \)
PROBLEM 2.79

The plastic block shown is bonded to a rigid support and to a vertical plate to which a 55-kip load $P$ is applied. Knowing that for the plastic used $G = 150$ ksi, determine the deflection of the plate.

SOLUTION

$$A = (3.2)(4.8) = 15.36 \text{ in}^2$$

$$P = 55 \times 10^3 \text{ lb}$$

$$\tau = \frac{P}{A} = \frac{55 \times 10^3}{15.36} = 3580.7 \text{ psi}$$

$$G = 150 \times 10^3 \text{ psi}$$

$$\gamma = \frac{\tau}{G} = \frac{3580.7}{150 \times 10^3} = 23.871 \times 10^{-3}$$

$$h = 2 \text{ in.}$$

$$\delta = h\gamma = (2)(23.871 \times 10^{-3}) = 47.7 \times 10^{-3} \text{ in.}$$

$$\delta = 0.0477 \text{ in.}$$
PROBLEM 2.80

What load $P$ should be applied to the plate of Prob. 2.79 to produce a $\frac{1}{16}$-in. deflection?

PROBLEM 2.79 The plastic block shown is bonded to a rigid support and to a vertical plate to which a 55-kip load $P$ is applied. Knowing that for the plastic used $G = 150$ ksi, determine the deflection of the plate.

SOLUTION

$\delta = \frac{1}{16}$ in. = 0.0625 in.

$h = 2$ in.

$\gamma = \frac{\delta}{h} = \frac{0.0625}{2} = 0.03125$

$G = 150 \times 10^3$ psi

$\tau = G\gamma = (150 \times 10^3)(0.03125)$

$\quad = 4687.5$ psi

$A = (3.2)(4.8) = 15.36$ in$^2$

$P = \tau A = (4687.5)(15.36)$

$\quad = 72 \times 10^3$ lb

72 kips
PROBLEM 2.81

Two blocks of rubber with a modulus of rigidity $G = 12$ MPa are bonded to rigid supports and to a plate $AB$. Knowing that $c = 100$ mm and $P = 45$ kN, determine the smallest allowable dimensions $a$ and $b$ of the blocks if the shearing stress in the rubber is not to exceed 1.4 MPa and the deflection of the plate is to be at least 5 mm.

SOLUTION

Shearing strain:

$$\gamma = \frac{\delta}{a} = \frac{\tau}{G}$$

$$a = \frac{G\delta}{\tau} = \frac{(12 \times 10^6 \text{ Pa})(0.005 \text{ m})}{1.4 \times 10^6 \text{ Pa}} = 0.0429 \text{ m}$$

$a = 42.9$ mm

Shearing stress:

$$\tau = \frac{\frac{1}{2}P}{A} = \frac{P}{2bc}$$

$$b = \frac{P}{2c\tau} = \frac{45 \times 10^3 \text{ N}}{2(0.1 \text{ m})(1.4 \times 10^6 \text{ Pa})} = 0.1607 \text{ m}$$

$b = 160.7$ mm
PROBLEM 2.82

Two blocks of rubber with a modulus of rigidity $G = 10$ MPa are bonded to rigid supports and to a plate $AB$. Knowing that $b = 200$ mm and $c = 125$ mm, determine the largest allowable load $P$ and the smallest allowable thickness $a$ of the blocks if the shearing stress in the rubber is not to exceed 1.5 MPa and the deflection of the plate is to be at least 6 mm.

SOLUTION

Shearing stress:

$$\tau = \frac{1}{2} \frac{P}{A} = \frac{P}{2bc}$$

\[ P = 2bc\tau = 2(0.2 \text{ m})(0.125 \text{ m})(1.5 \times 10^3 \text{ kPa}) \]

\[ P = 75.0 \text{ kN} \]

Shearing strain:

$$\gamma = \frac{\delta}{a} = \frac{\tau}{G}$$

\[ a = \frac{G\delta}{\tau} = \frac{(10 \times 10^6 \text{ Pa})(0.006 \text{ m})}{1.5 \times 10^6 \text{ Pa}} = 0.04 \text{ m} \]

\[ a = 40.0 \text{ mm} \]

SOLUTION

\[

\]

\[
\varepsilon_y = \varepsilon_z = -v\varepsilon_x = -v\frac{\sigma_x}{E}

\[
e = \varepsilon_x + \varepsilon_y + \varepsilon_z = \frac{1}{E} (\sigma_x - v\sigma_x - v\sigma_x) = (1 - 2v)\sigma_x

Volume: \( V = AL = (380.13 \text{ mm}^2)(200 \text{ mm}) = 76.026 \times 10^3 \text{ mm}^3 \)

\( \Delta V = Ve \)

(a) Steel: \( e = \frac{(1 - 0.60)(121.01 \times 10^6)}{200 \times 10^9} = 242 \times 10^{-6} \)

\( e = 242 \times 10^{-6} \downarrow \)

\( \Delta V = (76.026 \times 10^3)(242 \times 10^{-6}) = 18.40 \text{ mm}^3 \)

\( \Delta V = 18.40 \text{ mm}^3 \downarrow \)

(b) Aluminum: \( e = \frac{(1 - 0.70)(121.01 \times 10^6)}{70 \times 10^9} = 519 \times 10^{-6} \)

\( e = 519 \times 10^{-6} \downarrow \)

\( \Delta V = (76.026 \times 10^3)(519 \times 10^{-6}) = 39.4 \text{ mm}^3 \)

\( \Delta V = 39.4 \text{ mm}^3 \downarrow \)
PROBLEM 2.84

Determine the change in volume of the 2-in. gage length segment $AB$ in Prob. 2.61 (a) by computing the dilatation of the material, (b) by subtracting the original volume of portion $AB$ from its final volume.

SOLUTION

From Problem 2.61, thickness $= \frac{1}{16}$ in., $E = 29 \times 10^6$ psi, $v = 0.30$.

(a) $A = \left(\frac{1}{2}\right)\left(\frac{1}{16}\right) = 0.03125 \text{ in}^2$

Volume: $V_0 = AL_0 = (0.03125)(2.00) = 0.0625 \text{ in}^3$

$\sigma_x = \frac{P}{A} = \frac{600}{0.03125} = 19.2 \times 10^3 \text{ psi} \quad \sigma_y = \sigma_z = 0$

$\varepsilon_x = \frac{1}{E}(\sigma_x - v\sigma_y - v\sigma_z) = \frac{1}{E} \left(\frac{19.2 \times 10^3}{29 \times 10^6}\right) = 662.07 \times 10^{-6}$

$\varepsilon_y = \varepsilon_z = -v\varepsilon_x = -0.30(662.07 \times 10^{-6}) = -198.62 \times 10^{-6}$

$e = \varepsilon_x + \varepsilon_y + \varepsilon_z = 264.83 \times 10^{-6}$

$\Delta V = V_0e = (0.0625)(264.83 \times 10^{-6}) = 16.55 \times 10^{-6} \text{ in}^3$

(b) From the solution to Problem 2.61,

$\delta_x = 1.324 \times 10^{-3} \text{ in.}, \quad \delta_y = -99.3 \times 10^{-6} \text{ in.}, \quad \delta_z = -12.41 \times 10^{-6} \text{ in.}$

The dimensions when under a 600-lb tensile load are:

Length: $L = L_0 + \delta_x = 2 + 1.324 \times 10^{-3} = 2.001324 \text{ in.}$

Width: $w = w_0 + \delta_y = \frac{1}{2} - 99.3 \times 10^{-6} = 0.4999007 \text{ in.}$

Thickness: $t = t_0 + \delta_z = \frac{1}{16} - 12.41 \times 10^{-6} = 0.06248759 \text{ in.}$

Volume: $V = Lwt = 0.062516539 \text{ in}^3$

$\Delta V = V - V_0 = 0.062516539 - 0.0625 = 16.54 \times 10^{-6} \text{ in}^3$
PROBLEM 2.85*

A 6-in.-diameter solid steel sphere is lowered into the ocean to a point where the pressure is 7.1 ksi (about 3 miles below the surface). Knowing that $E = 29 \times 10^6$ psi and $\nu = 0.30$, determine (a) the decrease in diameter of the sphere, (b) the decrease in volume of the sphere, (c) the percent increase in the density of the sphere.

SOLUTION

For a solid sphere,

$$V_0 = \frac{\pi}{6}d_0^3$$

$$= \frac{\pi}{6}(6.00)^3$$

$$= 113.097 \text{ in.}^3$$

$$\sigma_x = \sigma_y = \sigma_z = -p$$

$$= -7.1 \times 10^3 \text{ psi}$$

$$\varepsilon_x = \varepsilon_y = \varepsilon_z = -p$$

$$= -\left(1 - 2\nu\right)p$$

$$= -\left(1 - 2\nu\right)(7.1 \times 10^3)$$

$$= -97.93 \times 10^{-6}$$

Likewise, $\varepsilon_y = \varepsilon_z = -97.93 \times 10^{-6}$

$$e = \varepsilon_x + \varepsilon_y + \varepsilon_z = -293.79 \times 10^{-6}$$

$$-\Delta d = -d_0 \varepsilon_x = -(6.00)(-97.93 \times 10^{-6}) = 588 \times 10^{-6} \text{ in.}$$

$$-\Delta d = 588 \times 10^{-6} \text{ in.} \blacktriangleright$$

$$-\Delta V = -V_0 e = -(113.097)(-293.79 \times 10^{-6}) = 33.2 \times 10^{-3} \text{ in}^3$$

$$-\Delta V = 33.2 \times 10^{-3} \text{ in}^3 \blacktriangleright$$

(c) Let $m$ = mass of sphere, $m$ = constant.

$$m = \rho_0 V_0 = \rho V = \rho V_0 (1 + e)$$

$$\frac{\rho - \rho_0}{\rho_0} = \frac{\rho}{\rho_0} - 1 = \frac{m}{V_0(1 + e)} - 1 = \frac{1}{1 + e} - 1$$

$$= (1 - e + e^2 - e^3 + \cdots) - 1 = -e + e^2 - e^3 + \cdots$$

$$= -e = 293.79 \times 10^{-6}$$

$$\frac{\rho - \rho_0}{\rho_0} \times 100\% = (293.79 \times 10^{-6})(100\%) = 0.0294\% \blacktriangleright$$

SOLUTION

\[
k = \frac{E}{3(1 - 2v)} \quad \text{and} \quad G = \frac{E}{2(1 + v)}
\]

(a) \( 1 + v = \frac{E}{2G} \) or \( v = \frac{E}{2G} - 1 \)

\[
k = \frac{E}{3\left[1 - 2\left(\frac{E}{2G} - 1\right)\right]} = \frac{2EG}{3[2G - 2E + 4G]} = \frac{2EG}{18G - 6E}
\]

\[
k = \frac{EG}{9G - 6E}
\]

(b) \( \frac{k}{G} = \frac{2(1 + v)}{3(1 - 2v)} \)

\[
3k - 6kv = 2G + 2Gv
\]

\[
3k - 2G = 2G + 6k
\]

\[
v = \frac{3k - 2G}{6k + 2G}
\]
**PROBLEM 2.90**

Show that for any given material, the ratio $G/E$ of the modulus of rigidity over the modulus of elasticity is always less than $\frac{1}{2}$ but more than $\frac{1}{3}$. [Hint: Refer to Eq. (2.43) and to Sec. 2.13.]

**SOLUTION**

$$G = \frac{E}{2(1 + \nu)} \quad \text{or} \quad \frac{E}{G} = 2(1 + \nu)$$

Assume $\nu > 0$ for almost all materials, and $\nu < \frac{1}{2}$ for a positive bulk modulus.

Applying the bounds,

$$2 \leq \frac{E}{G} < 2 \left( 1 + \frac{1}{2} \right) = 3$$

Taking the reciprocals,

$$\frac{1}{2} > \frac{G}{E} > \frac{1}{3}$$

or

$$\frac{1}{3} < \frac{G}{E} < \frac{1}{2}$$
PROBLEM 2.91

A composite cube with 40-mm sides and the properties shown is made with glass polymer fibers aligned in the $x$ direction. The cube is constrained against deformations in the $y$ and $z$ directions and is subjected to a tensile load of 65 kN in the $x$ direction. Determine (a) the change in the length of the cube in the $x$ direction, (b) the stresses $\sigma_x$, $\sigma_y$, and $\sigma_z$.

$$E_x = 50 \text{ GPa} \quad v_{xz} = 0.254$$
$$E_y = 15.2 \text{ GPa} \quad v_{xy} = 0.254$$
$$E_z = 15.2 \text{ GPa} \quad v_{yz} = 0.428$$

SOLUTION

Stress-to-strain equations are

$$\varepsilon_x = \frac{\sigma_x}{E_x} - \frac{v_{yx} \sigma_y}{E_y} - \frac{v_{zx} \sigma_z}{E_z} \quad (1)$$

$$\varepsilon_y = -\frac{\sigma_y}{E_y} + \frac{\sigma_x}{E_x} - \frac{v_{xy} \sigma_x}{E_y} \quad (2)$$

$$\varepsilon_z = -\frac{\sigma_z}{E_z} - \frac{\sigma_y}{E_y} + \frac{\sigma_x}{E_x} \quad (3)$$

$$\frac{v_{xy}}{E_x} = \frac{v_{yx}}{E_y} \quad (4)$$

$$\frac{v_{xz}}{E_y} = \frac{v_{xz}}{E_z} \quad (5)$$

$$\frac{v_{yz}}{E_z} = \frac{v_{yz}}{E_x} \quad (6)$$

The constraint conditions are $\varepsilon_y = 0$ and $\varepsilon_z = 0$.

Using (2) and (3) with the constraint conditions gives

$$\frac{1}{E_y} \sigma_y - \frac{v_{yx}}{E_x} \sigma_z = \frac{v_{xy}}{E_x} \sigma_x \quad (7)$$

$$-\frac{v_{xz}}{E_y} \sigma_y + \frac{1}{E_z} \sigma_z = \frac{v_{xz}}{E_x} \sigma_x \quad (8)$$

$$\frac{1}{15.2} \sigma_y - 0.428 \frac{1}{15.2} \sigma_z = 0.254 \frac{50}{\sigma_x} \quad \text{or} \quad \sigma_y - 0.428 \sigma_z = 0.077216 \sigma_x$$

$$-0.428 \frac{1}{15.2} \sigma_y + \frac{1}{15.2} \sigma_z = 0.254 \frac{50}{\sigma_x} \quad \text{or} \quad -0.428 \sigma_y + 0.077216 \sigma_x = 0.254 \sigma_z$$
PROBLEM 2.91* (Continued)

Solving simultaneously,

\[ \sigma_y = \sigma_z = 0.134993 \sigma_x \]

Using (4) and (5) in (1),

\[ \varepsilon_x = \frac{1}{E_x} \sigma_x - \frac{v_{xy}}{E} \sigma_y - \frac{v_{xz}}{E} \sigma_z \]

\[
\begin{align*}
E_x &= \frac{1}{E_x} \left[ 1 - (0.254)(0.134993) - (0.254)(0.134993) \right] \sigma_x \\
&= \frac{0.93142 \sigma_x}{E_x} \\
A &= (40)(40) = 1600 \text{ mm}^2 = 1600 \times 10^{-6} \text{ m}^2 \\
\sigma_x &= \frac{P}{A} = \frac{65 \times 10^3}{1600 \times 10^{-6}} = 40.625 \times 10^6 \text{ Pa} \\
\varepsilon_x &= \frac{(0.93142)(40.625 \times 10^6)}{50 \times 10^9} = 756.78 \times 10^{-6} \text{ (Pa)}
\end{align*}
\]

(a) \[ \delta_x = L_x \varepsilon_x = (40 \text{ mm})(756.78 \times 10^{-6}) = 0.0303 \text{ mm} \]

(b) \[ \sigma_x = 40.625 \times 10^6 \text{ Pa} \]

\[ \sigma_y = \sigma_z = (0.134993)(40.625 \times 10^6) = 5.48 \times 10^6 \text{ Pa} \]
PROBLEM 2.92*

The composite cube of Prob. 2.91 is constrained against deformation in the z direction and elongated in the x direction by 0.035 mm due to a tensile load in the x direction. Determine (a) the stresses $\sigma_x$, $\sigma_y$, and $\sigma_z$, (b) the change in the dimension in the y direction.

\[
\begin{align*}
E_x &= 50 \text{ GPa} \quad v_{xz} = 0.254 \\
E_y &= 15.2 \text{ GPa} \quad v_{xy} = 0.254 \\
E_z &= 15.2 \text{ GPa} \quad v_{yz} = 0.428
\end{align*}
\]

SOLUTION

\[
\begin{align*}
\varepsilon_x &= \frac{\sigma_x}{E_x} - \frac{v_{yx}\sigma_y}{E_y} - \frac{v_{zx}\sigma_z}{E_z} \\
\varepsilon_y &= \frac{\sigma_y}{E_y} + \frac{\sigma_x}{E_x} - \frac{v_{zy}\sigma_z}{E_z} \\
\varepsilon_z &= \frac{\sigma_z}{E_z} - \frac{v_{zy}\sigma_y}{E_y} - \frac{\sigma_x}{E_x}
\end{align*}
\]

\[
\begin{align*}
v_{yx} &= \frac{v_{xy}}{E_x} \\
v_{zx} &= \frac{v_{xz}}{E_z}
\end{align*}
\]

Constraint condition: $\varepsilon_z = 0$
Load condition: $\sigma_y = 0$

From Equation (3),

\[
0 = -\frac{v_{yz}}{E_x} \sigma_x + \frac{1}{E_x} \sigma_z
\]

\[
\sigma_z = \frac{v_{yz}E_z}{E_x} \sigma_x = \frac{(0.254)(15.2)}{50} = 0.077216 \sigma_x
\]
From Equation (1) with $\sigma_y = 0$,

$$\varepsilon = \frac{1}{E_x} \sigma_x - \frac{v_{xy}}{E_y} \sigma_y = \frac{1}{E_x} \sigma_x - \frac{v_{xy}}{E_y} \sigma_y$$

$$= \frac{1}{E_x} [\sigma_x - 0.254 \sigma_y] = \frac{1}{E_x} [1 - (0.254)(0.077216)] \sigma_x$$

$$= \frac{0.98039}{E_x} \sigma_x$$

$$\sigma_x = \frac{E_x \varepsilon_x}{0.98039}$$

But, $\varepsilon = \frac{\delta_x}{L_x} = \frac{0.035 \text{ mm}}{40 \text{ mm}} = 875 \times 10^{-6}$

(a) $\sigma_x = \frac{(50 \times 10^3)(875 \times 10^{-6})}{0.98039} = 44.625 \times 10^3 \text{ Pa}$

$\sigma_x = 44.6 \text{ MPa}$

$\sigma_y = 0$

$\sigma_z = (0.077216)(44.625 \times 10^3) = 3.446 \times 10^6 \text{ Pa}$

$\sigma_z = 3.45 \text{ MPa}$

From (2),

$$\varepsilon_y = \frac{v_{xy}}{E_x} \sigma_x + \frac{1}{E_y} \sigma_y - \frac{v_{xy}}{E_z} \sigma_z$$

$$= - (0.254)(44.625 \times 10^3) + 0 - \frac{(0.428)(3.446 \times 10^6)}{15.2 \times 10^9}$$

$$= -323.73 \times 10^{-6}$$

(b) $\delta_y = L_y \varepsilon_y = (40 \text{ mm})(-323.73 \times 10^{-6})$

$\delta_y = -0.0129 \text{ mm}$
PROBLEM 2.93

Two holes have been drilled through a long steel bar that is subjected to a centric axial load as shown. For $P = 6.5$ kips, determine the maximum value of the stress $(a)$ at $A$, $(b)$ at $B$.

SOLUTION

(a) At hole $A$: $r = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$ in.

\[ d = 3 - \frac{1}{2} = 2.50 \text{ in.} \]

\[ A_{\text{net}} = dt = (2.50)\left(\frac{1}{2}\right) = 1.25 \text{ in}^2 \]

\[ \sigma_{\text{non}} = \frac{P}{A_{\text{net}}} = \frac{6.5}{1.25} = 5.2 \text{ ksi} \]

\[ 2r = \frac{2(\frac{1}{4})}{3} = 0.1667 \]

From Fig. 2.60a, $K = 2.56$

\[ \sigma_{\max} = K\sigma_{\text{non}} = (2.56)(5.2) \]

\[ \sigma_{\max} = 13.31 \text{ ksi} \]

(b) At hole $B$: $r = \frac{1}{2}(1.5) = 0.75$, $d = 3 - 1.5 = 1.5$ in.

\[ A_{\text{net}} = dt = (1.5)\left(\frac{1}{2}\right) = 0.75 \text{ in}^2, \quad \sigma_{\text{non}} = \frac{P}{A_{\text{net}}} = \frac{6.5}{0.75} = 8.667 \text{ ksi} \]

\[ 2r = \frac{2(0.75)}{3} = 0.5 \]

From Fig. 2.60a, $K = 2.16$

\[ \sigma_{\max} = K\sigma_{\text{non}} = (2.16)(8.667) \]

\[ \sigma_{\max} = 18.72 \text{ ksi} \]
PROBLEM 2.94

Knowing that $\sigma_{all} = 16$ ksi, determine the maximum allowable value of the centric axial load $P$.

SOLUTION

At hole $A$:

$r = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$ in.

d = $3 - \frac{1}{2} = 2.50$ in.

$A_{net} = dt = (2.50) \left(\frac{1}{2}\right) = 1.25$ in$^2$

$\frac{2r}{D} = \frac{2(\frac{1}{4})}{3} = 0.1667$

From Fig. 2.60a, $K = 2.56$

$\sigma_{max} = \frac{KP}{A_{net}}$ :: $P = \frac{A_{net}\sigma_{max}}{K} = \frac{(1.25)(16)}{2.56} = 7.81$ kips

At hole $B$:

$r = \frac{1}{2}(1.5) = 0.75$ in, \hspace{0.5cm} d = 3 - 1.5 = 1.5$ in.

$A_{net} = dt = (1.5) \left(\frac{1}{2}\right) = 0.75$ in$^2$.

$\frac{2r}{D} = \frac{2(0.75)}{3} = 0.5$

From Fig. 2.60a, $K = 2.16$

$P = \frac{A_{net}\sigma_{max}}{K} = \frac{(0.75)(16)}{2.16} = 5.56$ kips

Smaller value for $P$ controls. \hspace{1cm} P = 5.56 kips
PROBLEM 2.95

Knowing that the hole has a diameter of 9 mm, determine (a) the radius \( r_f \) of the fillets for which the same maximum stress occurs at the hole \( A \) and at the fillets, (b) the corresponding maximum allowable load \( P \) if the allowable stress is 100 MPa.

SOLUTION

For the circular hole,

\[
\begin{align*}
    r &= \left( \frac{1}{2} \right) (9) = 4.5 \text{ mm} \\
    d &= 96 - 9 = 87 \text{ mm} \\
    \frac{2r}{D} &= \frac{2(4.5)}{96} = 0.09375 \\
    A_{\text{net}} &= dt = (0.087 \text{ m})(0.009 \text{ m}) = 783 \times 10^{-6} \text{ m}^2
\end{align*}
\]

From Fig. 2.60a,

\[
\begin{align*}
    K_{\text{hole}} &= 2.72 \\
    \sigma_{\text{max}} &= \frac{K_{\text{hole}}P}{A_{\text{net}}} \\
    P &= \frac{A_{\text{net}}\sigma_{\text{max}}}{K_{\text{hole}}} = \frac{(783 \times 10^{-6})(100 \times 10^6)}{2.72} = 28.787 \times 10^3 \text{ N}
\end{align*}
\]

(a) For fillet,

\[
\begin{align*}
    D &= 96 \text{ mm, } d = 60 \text{ mm} \\
    \frac{D}{d} &= \frac{96}{60} = 1.60 \\
    A_{\text{min}} &= dt = (0.060 \text{ m})(0.009 \text{ m}) = 540 \times 10^{-6} \text{ m}^2 \\
    \sigma_{\text{max}} &= \frac{K_{\text{fillet}}P}{A_{\text{min}}} \\
    \sigma_{\text{max}} &= \frac{A_{\text{min}}\sigma_{\text{max}}}{P} = \frac{(5.40 \times 10^{-6})(100 \times 10^6)}{28.787 \times 10^3} = 1.876
\end{align*}
\]

From Fig. 2.60b,

\[
\begin{align*}
    \frac{r_f}{d} &= 0.19 \therefore r_f = 0.19d = 0.19(60) = 11.4 \text{ mm} \\
    r_f &= 11.4 \text{ mm} \heartsuit \heartsuit
\end{align*}
\]

(b) \( P = 28.8 \text{ kN} \heartsuit \heartsuit \)
PROBLEM 2.96

For \( P = 100 \) kN, determine the minimum plate thickness \( t \) required if the allowable stress is 125 MPa.

SOLUTION

At the hole:

\( r_A = 20 \text{ mm} \quad d_A = 88 - 40 = 48 \text{ mm} \)

\[
\begin{align*}
\frac{2r_A}{D_A} &= \frac{2(20)}{88} = 0.455 \\
K &= 2.20 \\
\sigma_{\text{max}} &= \frac{KP}{A_{\text{net}}} = \frac{KP}{d_A t} \\
\therefore \quad t &= \frac{KP}{d_A \sigma_{\text{max}}} \\
&= \frac{(2.20)(100 \times 10^3 \text{ N})}{(0.048 \text{ m})(125 \times 10^6 \text{ Pa})} = 36.7 \times 10^{-3} \text{ m} = 36.7 \text{ mm}
\end{align*}
\]

At the fillet:

\( D = 88 \text{ mm}, \quad d_B = 64 \text{ mm} \quad \frac{D}{d_B} = \frac{88}{64} = 1.375 \)

\( r_B = 15 \text{ mm} \quad \frac{r_B}{d_B} = \frac{15}{64} = 0.2344 \)

From Fig. 2.60b,

\( K = 1.70 \)

\[
\begin{align*}
\sigma_{\text{max}} &= \frac{KP}{A_{\text{min}}} = \frac{KP}{d_B t} \\
\therefore \quad t &= \frac{KP}{d_B \sigma_{\text{max}}} \\
&= \frac{(1.70)(100 \times 10^3 \text{ N})}{(0.064 \text{ m})(125 \times 10^6 \text{ Pa})} = 21.25 \times 10^{-3} \text{ m} = 21.25 \text{ mm}
\end{align*}
\]

The larger value is the required minimum plate thickness.

\( t = 36.7 \text{ mm} \)
PROBLEM 2.97

The aluminum test specimen shown is subjected to two equal and opposite centric axial forces of magnitude \(P\). (a) Knowing that \(E = 70\ \text{GPa}\) and \(\sigma_{\text{all}} = 200\ \text{MPa}\), determine the maximum allowable value of \(P\) and the corresponding total elongation of the specimen. (b) Solve part (a), assuming that the specimen has been replaced by an aluminum bar of the same length and a uniform \(60 \times 15\)-mm rectangular cross section.

\[\sigma_{\text{all}} = 200 \times 10^6\ \text{Pa}\quad E = 70 \times 10^9\ \text{Pa}\]

\[A_{\text{min}} = (60\ \text{mm})(15\ \text{mm}) = 900\ \text{mm}^2 = 900 \times 10^{-6}\ \text{m}^2\]

(a) Test specimen.

\[D = 75\ \text{mm},\ d = 60\ \text{mm},\ r = 6\ \text{mm}\]

\[
\frac{D}{d} = \frac{75}{60} = 1.25\quad \frac{r}{d} = \frac{6}{60} = 0.10
\]

From Fig. 2.60b

\[
K = 1.95\quad \sigma_{\text{max}} = K\frac{P}{A}
\]

\[
P = \frac{A\sigma_{\text{max}}}{K} = \frac{(900 \times 10^{-6})(200 \times 10^6)}{1.95} = 92.308 \times 10^3\ \text{N} = 92.3\ \text{kN}\quad \boxed{P = 92.3\ \text{kN}}
\]

Wide area \(A^* = (75\ \text{mm})(15\ \text{mm}) = 1125\ \text{mm}^2 = 1.125 \times 10^{-3}\ \text{m}^2\)

\[
\delta = \frac{\Sigma P_{L_i} A_i}{E \Sigma A_i} = \frac{92.308 \times 10^3}{70 \times 10^9} \left[ \frac{0.150}{1.125 \times 10^{-3}} + \frac{0.300}{900 \times 10^{-6}} + \frac{0.150}{1.125 \times 10^{-3}} \right] = 7.91 \times 10^{-6}\ \text{m} = 0.791\ \text{mm}\quad \boxed{\delta = 0.791\ \text{mm}}
\]

(b) Uniform bar.

\[
P = A\sigma_{\text{all}} = (900 \times 10^{-6})(200 \times 10^6) = 180 \times 10^3\ \text{N} = 180.0\ \text{kN}\quad \boxed{P = 180.0\ \text{kN}}
\]

\[
\delta = \frac{PL}{AE} = \frac{(180 \times 10^3)(0.600)}{(900 \times 10^{-6})(70 \times 10^3)} = 1.714 \times 10^{-3}\ \text{m} = 1.714\ \text{mm}\quad \boxed{\delta = 1.714\ \text{mm}}
\]
**PROBLEM 2.98**

For the test specimen of Prob. 2.97, determine the maximum value of the normal stress corresponding to a total elongation of 0.75 mm.

**PROBLEM 2.97** The aluminum test specimen shown is subjected to two equal and opposite centric axial forces of magnitude $P$. (a) Knowing that $E = 70$ GPa and $\sigma_{all} = 200$ MPa, determine the maximum allowable value of $P$ and the corresponding total elongation of the specimen. (b) Solve part (a), assuming that the specimen has been replaced by an aluminum bar of the same length and a uniform $60 \times 15$-mm rectangular cross section.

---

**SOLUTION**

\[
\delta = \sum \frac{P L_i}{E A_i} = \frac{P}{E} \sum \frac{L_i}{A_i} \quad \delta = 0.75 \times 10^{-3} \text{ m}
\]

$L_1 = L_2 = 150 \text{ mm} = 0.150 \text{ m}, \quad L_2 = 300 \text{ mm} = 0.300 \text{ m}$

$A_1 = A_2 = (75 \text{ mm})(15 \text{ mm}) = 1125 \text{ mm}^2 = 1.125 \times 10^{-3} \text{ m}^2$

$A_2 = (60 \text{ mm})(15 \text{ mm}) = 900 \text{ mm}^2 = 900 \times 10^{-6} \text{ m}^2$

\[
\sum \frac{L_i}{A_i} = \frac{0.150}{1.125 \times 10^{-3}} + \frac{0.300}{900 \times 10^{-6}} + \frac{0.150}{1.125 \times 10^{-3}} = 600 \text{ m}^{-1}
\]

\[
P = \frac{E \delta}{\sum \frac{L_i}{A_i}} = \frac{(7.0 \times 10^9)(0.75 \times 10^{-3})}{600} = 87.5 \times 10^3 \text{ N}
\]

Stress concentration:

$D = 75 \text{ mm}, \quad d = 60 \text{ mm}, \quad r = 6 \text{ mm}$

\[
\frac{D}{d} = \frac{75}{60} = 1.25 \quad \frac{r}{d} = \frac{6}{60} = 0.10
\]

From Fig. 2.60b

$K = 1.95$

\[
\sigma_{max} = K \frac{P}{A_{\text{min}}} = \frac{(1.95)(87.5 \times 10^3)}{900 \times 10^{-6}} = 189.6 \times 10^6 \text{ Pa} \quad \sigma_{max} = 189.6 \text{ MPa}
\]

Note that $\sigma_{max} < \sigma_{all}$.

PROBLEM 2.99

A hole is to be drilled in the plate at \( A \). The diameters of the bits available to drill the hole range from \( \frac{1}{2} \) to \( 1\frac{1}{2} \) in. in \( \frac{1}{4}\)-in. increments. If the allowable stress in the plate is 21 ksi, determine (a) the diameter \( d \) of the largest bit that can be used if the allowable load \( P \) at the hole is to exceed that at the fillets, (b) the corresponding allowable load \( P \).

SOLUTION

At the fillets:

\[
\frac{D}{d} = \frac{4.6875}{3.125} = 1.5 \quad \frac{r}{d} = \frac{0.375}{3.125} = 0.12
\]

From Fig. 2.60b,

\[ K = 2.10 \]

\[ A_{\text{min}} = (3.125)(0.5) = 1.5625 \text{ in}^2 \]

\[
\sigma_{\text{max}} = K \frac{P_{\text{all}}}{A_{\text{min}}} = \sigma_{\text{all}}
\]

\[
P_{\text{all}} = \frac{A_{\text{min}} \sigma_{\text{all}}}{K} = \frac{(1.5625)(21)}{2.10} = 15.625 \text{ kips}
\]

At the hole:

\[ A_{\text{net}} = (D - 2r)t \text{, } K \text{ from Fig. 2.60a} \]

\[
\sigma_{\text{max}} = K \frac{P}{A_{\text{net}}} = \sigma_{\text{all}} \quad \therefore \quad P_{\text{all}} = \frac{A_{\text{net}} \sigma_{\text{all}}}{K}
\]

with

\[ D = 4.6875 \text{ in.} \quad t = 0.5 \text{ in.} \quad \sigma_{\text{all}} = 21 \text{ ksi} \]

(a) Largest hole with \( P_{\text{all}} > 15.625 \text{ kips} \) is the \( \frac{3}{4}\)-in. diameter hole.

(b) Allowable load \( P_{\text{all}} = 15.63 \text{ kips} \)
PROBLEM 2.100

(a) For \( P = 13 \) kips and \( d = \frac{1}{2} \) in., determine the maximum stress in the plate shown. (b) Solve part a, assuming that the hole at \( A \) is not drilled.

SOLUTION

Maximum stress at hole:

Use Fig. 2.60a for values of \( K \).

\[
\frac{2r}{D} = \frac{0.5}{4.6875} = 0.017, \quad K = 2.68
\]

\[
A_{\text{net}} = (0.5)(4.6875 - 0.5) = 2.0938 \text{ in}^2
\]

\[
\sigma_{\text{max}} = \frac{K}{A_{\text{net}}} \frac{P}{2.0938} = \frac{(2.68)(13)}{2.0938} = 16.64 \text{ ksi}
\]

Maximum stress at fillets:

Use Fig. 2.60b for values of \( K \).

\[
\frac{r}{d} = \frac{0.375}{3.125} = 0.12 \quad \frac{D}{d} = \frac{4.6875}{3.125} = 1.5 \quad K = 2.10
\]

\[
A_{\text{min}} = (0.5)(3.125) = 1.5625 \text{ in}^2
\]

\[
\sigma_{\text{max}} = \frac{K}{A_{\text{min}}} \frac{P}{1.5625} = \frac{(2.10)(13)}{1.5625} = 17.47 \text{ ksi}
\]

(a) With hole and fillets: 17.47 ksi

(b) Without hole: 17.47 ksi
PROBLEM 2.101

Rod $ABC$ consists of two cylindrical portions $AB$ and $BC$; it is made of a mild steel that is assumed to be elastoplastic with $E = 200$ GPa and $\sigma_Y = 250$ MPa. A force $P$ is applied to the rod and then removed to give it a permanent set $\delta_p = 2 \text{ mm}$. Determine the maximum value of the force $P$ and the maximum amount $\delta_m$ by which the rod should be stretched to give it the desired permanent set.

SOLUTION

$$A_{AB} = \frac{\pi}{4}(30)^2 = 706.86 \text{ mm}^2 = 706.86 \times 10^{-6} \text{ m}^2$$

$$A_{BC} = \frac{\pi}{4}(40)^2 = 1.25664 \times 10^3 \text{ mm}^2 = 1.25664 \times 10^{-3} \text{ m}^2$$

$$P_{\text{max}} = A_{\text{max}} \sigma_Y = (706.86 \times 10^{-6})(250 \times 10^6) = 176.715 \times 10^3 \text{ N}$$

$$P_{\text{max}} = 176.7 \text{ kN}$$

$$\delta' = \frac{P_{LAB}}{E A_{AB}} + \frac{P'_{LBC}}{E A_{BC}} = \frac{(176.715 \times 10^3)(0.8)}{(200 \times 10^6)(706.86 \times 10^{-6})} + \frac{(176.715 \times 10^3)(1.2)}{(200 \times 10^6)(1.25664 \times 10^{-3})}$$

$$= 1.84375 \times 10^{-3} \text{ m} = 1.84375 \text{ mm}$$

$$\delta_p = \delta_m - \delta' \text{ or } \delta_m = \delta_p + \delta' = 2 + 1.84375 \text{ mm}$$

$$\delta_m = 3.84 \text{ mm}$$
PROBLEM 2.102

Rod $ABC$ consists of two cylindrical portions $AB$ and $BC$; it is made of a mild steel that is assumed to be elastoplastic with $E = 200$ GPa and $\sigma_y = 250$ MPa. A force $P$ is applied to the rod until its end $A$ has moved down by an amount $\delta_m = 5$ mm. Determine the maximum value of the force $P$ and the permanent set of the rod after the force has been removed.

SOLUTION

\[ A_{AB} = \frac{\pi}{4} (30)^2 = 706.86 \text{ mm}^2 = 706.86 \times 10^{-6} \text{ m}^2 \]
\[ A_{BC} = \frac{\pi}{4} (40)^2 = 12566.4 \times 10^3 \text{ mm}^2 = 1.25644 \times 10^{-3} \text{ m}^2 \]
\[ P_{\text{max}} = A_{\text{min}} \sigma_y = (706.86 \times 10^{-6})(250 \times 10^6) = 176.715 \times 10^3 \text{ N} \]
\[ P_{\text{max}} = 176.7 \text{ kN} \]

\[ \delta' = \frac{P'L_{AB}}{EA_{AB}} + \frac{P'L_{BC}}{EA_{BC}} = \frac{(176.715 \times 10^3)(0.8)}{(200 \times 10^6)(706.68 \times 10^{-6})} + \frac{(176.715 \times 10^3)(1.2)}{(200 \times 10^6)(1.25664 \times 10^{-3})} \]
\[ = 1.84375 \times 10^{-3} \text{ m} = 1.84357 \text{ mm} \]
\[ \delta_p = \delta_m - \delta' = 5 - 1.84375 = 3.16 \text{ mm} \]
\[ \delta_p = 3.16 \text{ mm} \]
PROBLEM 2.103

The 30-mm square bar $AB$ has a length $L = 2.2$ m; it is made of a mild steel that is assumed to be elastoplastic with $E = 200$ GPa and $\sigma_Y = 345$ MPa. A force $P$ is applied to the bar until end $A$ has moved down by an amount $\delta_m$. Determine the maximum value of the force $P$ and the permanent set of the bar after the force has been removed, knowing that (a) $\delta_m = 4.5$ mm, (b) $\delta_m = 8$ mm.

SOLUTION

$A = (30)(30) = 900$ mm$^2 = 900 \times 10^{-6}$ m$^2$

$\delta_Y = L \sigma_Y = \frac{L \sigma_Y}{E} = \frac{(2.2)(345 \times 10^6)}{200 \times 10^9} = 3.795 \times 10^{-3} = 3.795$ mm

If $\delta_m \geq \delta_Y$, $P_m = A \sigma_Y = (900 \times 10^{-6})(345 \times 10^6) = 310.5 \times 10^3$ N

Unloading: $\delta' = \frac{P_m L}{AE} = \frac{\sigma_Y L}{E} = \delta_Y = 3.795$ mm

$\delta_p = \delta_m - \delta'$

(a) $\delta_m = 4.5$ mm $> \delta_Y$ $P_m = 310.5 \times 10^3$ N $\delta_m = 310.5$ kN

$\delta_{perm} = 4.5$ mm $- 3.795$ mm $\delta_{perm} = 0.705$ mm

(b) $\delta_m = 8$ mm $> \delta_Y$ $P_m = 310.5 \times 10^3$ N $\delta_m = 310.5$ kN

$\delta_{perm} = 8.0$ mm $- 3.795$ mm $\delta_{perm} = 4.205$ mm
PROBLEM 2.104

The 30-mm square bar $AB$ has a length $L = 2.5 \, \text{m}$; it is made of mild steel that is assumed to be elastoplastic with $E = 200 \, \text{GPa}$ and $\sigma_Y = 345 \, \text{MPa}$. A force $P$ is applied to the bar and then removed to give it a permanent set $\delta_p$. Determine the maximum value of the force $P$ and the maximum amount $\delta_m$ by which the bar should be stretched if the desired value of $\delta_p$ is $(a)$ 3.5 mm, $(b)$ 6.5 mm.

SOLUTION

$$A = (30)(30) = 900 \, \text{mm}^2 = 900 \times 10^{-6} \, \text{m}^2$$

$$\delta_Y = L \varepsilon_Y = \frac{L \sigma_Y}{E} = \frac{(2.5)(345 \times 10^6)}{200 \times 10^9} = 4.3125 \times 10^{-3} \, \text{m} = 4.3125 \, \text{mm}$$

When $\delta_m$ exceeds $\delta_Y$, thus producing a permanent stretch of $\delta_p$, the maximum force is

$$P_m = A \sigma_Y = (900 \times 10^{-6})(345 \times 10^6) = 310.5 \times 10^3 \, \text{N} = 310.5 \, \text{kN}$$

$$\delta_p = \delta_m - \delta' = \delta_m - \delta_Y \quad : \quad \delta_m = \delta_p + \delta_Y$$

(a) $\delta_p = 3.5 \, \text{mm} \quad \delta_m = 3.5 \, \text{mm} + 4.3125 \, \text{mm} = 7.81 \, \text{mm}$

(b) $\delta_p = 6.5 \, \text{mm} \quad \delta_m = 6.5 \, \text{mm} + 4.3125 \, \text{mm} = 10.81 \, \text{mm}$
PROBLEM 2.105

Rod $AB$ is made of a mild steel that is assumed to be elastoplastic with $E = 29 \times 10^6$ psi and $\sigma_y = 36$ ksi. After the rod has been attached to the rigid lever $CD$, it is found that end $C$ is $\frac{3}{8}$ in. too high. A vertical force $Q$ is then applied at $C$ until this point has moved to position $C'$. Determine the required magnitude of $Q$ and the deflection $\delta_1$ if the lever is to snap back to a horizontal position after $Q$ is removed.

SOLUTION

Since the rod $AB$ is to be stretched permanently, the peak force in the rod is $P = P_y$, where

$$P_y = A\sigma_y = \frac{\pi}{4}\left(\frac{3}{8}\right)^2(36) = 3.976 \text{ kips}$$

Referring to the free body diagram of lever $CD$,

$$\Sigma M_D = 0: \quad 33Q - 22P = 0$$

$$Q = \frac{22}{33}P = \frac{(22)(3.976)}{33} = 2.65 \text{ kips}$$

During unloading, the spring back at $B$ is

$$\delta_B = L_{AB}\varepsilon_y = \frac{L_{AB}\sigma_y}{E} = \frac{(60)(36\times10^3)}{29\times10^6} = 0.0745 \text{ in.}$$

From the deformation diagram,

Slope:

$$\theta = \frac{\delta_B}{22} = \frac{\delta_C}{33} \quad : \quad \delta_C = \frac{33}{-22}\delta_B = 0.1117 \text{ in.}$$

$$\delta_C = 0.1117 \text{ in.}$$
**PROBLEM 2.106**

Solve Prob. 2.105, assuming that the yield point of the mild steel is 50 ksi.

**PROBLEM 2.105** Rod $AB$ is made of a mild steel that is assumed to be elastoplastic with $E = 29 \times 10^6$ psi and $\sigma_Y = 36$ ksi. After the rod has been attached to the rigid lever $CD$, it is found that end $C$ is $\frac{3}{8}$ in. too high. A vertical force $Q$ is then applied at $C$ until this point has moved to position $C'$. Determine the required magnitude of $Q$ and the deflection $\delta_c$ if the lever is to snap back to a horizontal position after $Q$ is removed.

**SOLUTION**

Since the rod $AB$ is to be stretched permanently, the peak force in the rod is $P = P_Y$, where

$$P_Y = A\sigma_Y = \frac{\pi}{4} \left(\frac{3}{8}\right)^2 (50) = 5.522 \text{ kips}$$

Referring to the free body diagram of lever $CD$,

$$\Sigma M_D = 0: \quad 33Q - 22P = 0$$

$$Q = \frac{22}{33}P = \frac{22(5.522)}{33} = 3.68 \text{ kips}$$

$$\delta_c = 0.1552 \text{ in.}$$
PROBLEM 2.107

Each cable has a cross-sectional area of 100 mm² and is made of an elastoplastic material for which \( \sigma_y = 345 \text{ MPa} \) and \( E = 200 \text{ GPa} \). A force \( Q \) is applied at \( C \) to the rigid bar \( ABC \) and is gradually increased from 0 to 50 kN and then reduced to zero. Knowing that the cables were initially taut, determine (a) the maximum stress that occurs in cable \( BD \), (b) the maximum deflection of point \( C \), (c) the final displacement of point \( C \). (Hint: In Part c, cable \( CE \) is not taut.)

SOLUTION

Elongation constraints for taut cables.

Let \( \theta = \) rotation angle of rigid bar \( ABC \).

\[
\frac{\delta_{BD}}{L_{AB}} = \frac{\delta_{CE}}{L_{AC}}
\]

\[
\delta_{BD} = \frac{L_{AB}}{L_{AC}} \delta_{CE} = \frac{1}{2} \delta_{CE}
\]

Equilibrium of bar \( ABC \).

\[
M_A = 0: \quad L_{AB} F_{BD} + L_{AC} F_{CE} - L_{AC} Q = 0
\]

\[
Q = F_{CE} + \frac{L_{AB}}{L_{AC}} F_{BD} = F_{CE} + \frac{1}{2} F_{BD}
\]

Assume cable \( CE \) is yielded. \( F_{CE} = A \sigma_y = (100 \times 10^{-6})(345 \times 10^6) = 34.5 \times 10^3 \text{ N} \)

From (2), \( F_{BD} = 2(Q - F_{CE}) = 2(50 \times 10^3 - 34.5 \times 10^3) = 31.0 \times 10^3 \text{ N} \)

Since \( F_{BD} < A \sigma_y = 34.5 \times 10^3 \text{ N} \), cable \( BD \) is elastic when \( Q = 50 \text{ kN} \).
PROBLEM 2.107 (Continued)

(a) Maximum stresses. \( \sigma_{CE} = \sigma_Y = 345 \text{ MPa} \)

\[
\sigma_{BD} = \frac{F_{BD}}{A} = \frac{31.0 \times 10^3}{100 \times 10^{-6}} = 310 \times 10^6 \text{ Pa} \quad \sigma_{BD} = 310 \text{ MPa}
\]

(b) Maximum of deflection of point C.

\[
\delta_{BD} = \frac{F_{BD}L_{BD}}{EA} = \frac{(31.0 \times 10^3)(2)}{(200 \times 10^9)(100 \times 10^{-6})} = 3.1 \times 10^{-3} \text{ m}
\]

From (1), \( \delta_C = \delta_{CE} = 2\delta_{BD} = 6.2 \times 10^{-3} \text{ m} \)

6.20 mm ↓

Permanent elongation of cable CE: \((\delta_{CE})_p = (\delta_{CE}) - \frac{\sigma_Y L_{CE}}{E}\)

\[
(\delta_{CE})_p = (\delta_{CE})_{max} - \frac{F_{CE}L_{CE}}{EA} = (\delta_{CE})_{max} - \frac{\sigma_Y L_{CE}}{E}
\]

\[
= 6.20 \times 10^{-3} - \frac{(345 \times 10^6)(2)}{200 \times 10^9} = 2.75 \times 10^{-3} \text{ m}
\]

(c) Unloading. Cable CE is slack \((F_{CE} = 0)\) at \(Q = 0\).

From (2), \( F_{BD} = 2(Q - F_{CE}) = 2(0 - 0) = 0 \)

Since cable BD remained elastic, \( \delta_{BD} = \frac{F_{BD}L_{BD}}{EA} = 0. \)
PROBLEM 2.108

Solve Prob. 2.107, assuming that the cables are replaced by rods of the same cross-sectional area and material. Further assume that the rods are braced so that they can carry compressive forces.

PROBLEM 2.107 Each cable has a cross-sectional area of 100 mm$^2$ and is made of an elastoplastic material for which $\sigma_y = 345$ MPa and $E = 200$ GPa. A force $Q$ is applied at $C$ to the rigid bar $ABC$ and is gradually increased from 0 to 50 kN and then reduced to zero. Knowing that the cables were initially taut, determine (a) the maximum stress that occurs in cable $BD$, (b) the maximum deflection of point $C$, (c) the final displacement of point $C$. (Hint: In Part c, cable $CE$ is not taut.)

SOLUTION

Elongation constraints.

Let $\theta =$ rotation angle of rigid bar $ABC$.

$$\theta = \frac{\delta_{BC}}{L_{AB}} = \frac{\delta_{CE}}{L_{AC}}$$

$$\delta_{BD} = \frac{L_{AB}}{L_{AC}} \delta_{CE} = \frac{1}{2} \delta_{CE}$$

(1)

Equilibrium of bar $ABC$.

$$+M_A = 0: L_{AB} F_{BD} + L_{AC} F_{CE} - L_{AC} Q = 0$$

$$Q = F_{CE} + \frac{L_{AB}}{L_{AC}} F_{BD} = F_{CE} + \frac{1}{2} F_{BD}$$

(2)

Assume cable $CE$ is yielded. $F_{CE} = A\sigma_y = (100 \times 10^{-6})(345 \times 10^6) = 34.5 \times 10^3$ N

From (2), $F_{BD} = 2(Q - F_{CE}) = 2(50 \times 10^3 - 34.5 \times 10^3) = 31.0 \times 10^3$ N

Since $F_{BD} < A\sigma_y = 34.5 \times 10^3$ N, cable $BD$ is elastic when $Q = 50$ kN.
PROBLEM 2.108 (Continued)

(a) Maximum stresses. \( \sigma_{CE} = \sigma_Y = 345 \text{ MPa} \)
\[
\sigma_{BD} = \frac{F_{BD}}{A} = \frac{31.0 \times 10^3}{100 \times 10^{-6}} = 310 \times 10^6 \text{ Pa} \quad \sigma_{BD} = 310 \text{ MPa}
\]

(b) Maximum of deflection of point C.
\[
\delta_{BD} = \frac{F_{BD}L_{BD}}{EA} = \frac{(31.0 \times 10^3)(2)}{(200 \times 10^9)(100 \times 10^{-6})} = 3.1 \times 10^{-3} \text{ m}
\]
From (1), \( \delta_c = \delta_{CE} = 2\delta_{BD} = 6.2 \times 10^{-3} \text{ m} \)

Unloading. \( Q' = 50 \times 10^3 \text{ N} \), \( \delta'_{CE} = \delta'_c \)

From (1), \( \delta'_{BD} = \frac{1}{2} \delta'_c \)

Elastic \( F'_{BD} = \frac{E A \delta'_{BD}}{L_{BD}} = \frac{(200 \times 10^9)(100 \times 10^{-6})(\frac{1}{2} \delta'_c)}{2} = 5 \times 10^6 \delta'_c \)

\[ F'_{CE} = \frac{E A \delta'_{CE}}{L_{CE}} = \frac{(200 \times 10^9)(100 \times 10^{-6})(\delta'_c)}{2} = 10 \times 10^6 \delta'_c \]

From (2), \( Q' = F'_{CE} + \frac{1}{2} F'_{BD} = 12.5 \times 10^6 \delta'_c \)

Equating expressions for \( Q' \), \( 12.5 \times 10^6 \delta'_c = 50 \times 10^3 \)
\[
\delta'_c = 4 \times 10^{-3} \text{ m}
\]

(c) Final displacement. \( \delta_c = (\delta'_c)_m - \delta'_c = 6.2 \times 10^{-3} - 4 \times 10^{-3} = 2.2 \times 10^{-3} \text{ m} \)

PROBLEM 2.109

Rod \( AB \) consists of two cylindrical portions \( AC \) and \( BC \), each with a cross-sectional area of 1750 \( \text{mm}^2 \). Portion \( AC \) is made of a mild steel with \( E = 200 \text{ GPa} \) and \( \sigma_Y = 250 \text{ MPa} \), and portion \( CB \) is made of a high-strength steel with \( E = 200 \text{ GPa} \) and \( \sigma_Y = 345 \text{ MPa} \). A load \( P \) is applied at \( C \) as shown. Assuming both steels to be elastoplastic, determine (a) the maximum deflection of \( C \) if \( P \) is gradually increased from zero to 975 kN and then reduced back to zero, (b) the maximum stress in each portion of the rod, (c) the permanent deflection of \( C \).

SOLUTION

Displacement at \( C \) to cause yielding of \( AC \).

\[
\delta_{C,Y} = L_{AC} \varepsilon_{Y,AC} = \frac{L_{AC} \sigma_{Y,AC}}{E} = \frac{(0.190)(250 \times 10^6)}{200 \times 10^9} = 0.2375 \times 10^{-3} \text{ m}
\]

Corresponding force.

\[
F_{AC} = A \sigma_{Y,AC} = (1750 \times 10^{-6})(250 \times 10^6) = 437.5 \times 10^3 \text{ N}
\]

\[
F_{CB} = -\frac{EA \delta_C}{L_{CB}} = -\frac{(200 \times 10^9)(1750 \times 10^{-6})(0.2375 \times 10^{-3})}{0.190} = -437.5 \times 10^3 \text{ N}
\]

For equilibrium of element at \( C \),

\[
F_{AC} - (F_{CB} + P_y) = 0 \quad P_y = F_{AC} - F_{CB} = 875 \times 10^3 \text{ N}
\]

Since applied load \( P = 975 \times 10^3 \text{ N} \) \( > 875 \times 10^3 \text{ N} \), portion \( AC \) yields.

\[
F_{CB} = F_{AC} - P = 437.5 \times 10^3 - 975 \times 10^3 \text{ N} = -537.5 \times 10^3 \text{ N}
\]

\( (a) \) \( \delta_C = -\frac{F_{CB} L_{CD}}{EA} = \frac{(537.5 \times 10^3)(0.190)}{(200 \times 10^9)(1750 \times 10^{-6})} = 0.29179 \times 10^{-3} \text{ m} \)

\( 0.292 \text{ mm} \uparrow \)

\( \sigma_{BC} = \frac{F_{BC}}{A} = \frac{537.5 \times 10^3}{1750 \times 10^{-6}} = -307.14 \times 10^6 \text{ Pa} = -307 \text{ MPa} \)

\( -307 \text{ MPa} \uparrow \)

\( (c) \) Deflection and forces for unloading.

\[

\]

\[
P' = 975 \times 10^3 = P_{AC}' - P_{CB}' = 2P_{AC}' \quad P_{AC}' = 487.5 \times 10^{-3} \text{ N}

\[
\delta' = \frac{(487.5 \times 10^{-3})(0.190)}{(200 \times 10^9)(1750 \times 10^{-6})} = 0.26464 \times 10^{-3} \text{ m}

\[

Portion $AC$ is made of a mild steel with $E = 200$ GPa and $\sigma_Y = 250$ MPa, and portion $CB$ is made of a high-strength steel with $E = 200$ GPa and $\sigma_Y = 345$ MPa. A load $P$ is applied at $C$ as shown. Assuming both steels to be elastoplastic, determine $(a)$ the maximum deflection of $C$ if $P$ is gradually increased from zero to 975 kN and then reduced back to zero, $(b)$ the maximum stress in each portion of the rod, $(c)$ the permanent deflection of $C$.

SOLUTION

Displacement at $C$ is $\delta_m = 0.30$ mm. The corresponding strains are

$$\varepsilon_{AC} = \frac{\delta_m}{L_{AC}} = \frac{0.30 \text{ mm}}{190 \text{ mm}} = 1.5789 \times 10^{-3}$$

$$\varepsilon_{CB} = \frac{\delta_m}{L_{CB}} = \frac{0.30 \text{ mm}}{190 \text{ mm}} = -1.5789 \times 10^{-3}$$

Strains at initial yielding:

$$\varepsilon_{Y,AC} = \frac{\sigma_{Y,AC}}{E} = \frac{250 \times 10^6}{200 \times 10^9} = 1.25 \times 10^{-3} \quad \text{(yielding)}$$

$$\varepsilon_{Y,CB} = \frac{\sigma_{Y,CB}}{E} = \frac{345 \times 10^6}{200 \times 10^9} = -1.725 \times 10^{-3} \quad \text{(elastic)}$$

$(a) \quad$ Forces: $F_{AC} = A\sigma_Y = (1750 \times 10^{-6})(250 \times 10^6) = 437.5 \times 10^{-3}$ N

$$F_{CB} = E A \varepsilon_{CB} = (200 \times 10^9)(1750 \times 10^{-6})(-1.5789 \times 10^{-3}) = -552.6 \times 10^{-3} \text{ N}$$

For equilibrium of element at $C$, $F_{AC} - F_{CB} - P = 0$

$$P = F_{AC} - F_{CB} = 437.5 \times 10^3 + 552.6 \times 10^3 = 990.1 \times 10^3 \text{ N} = 990 \text{ kN}$$

$(b) \quad$ Stresses: $AC: \quad \sigma_{AC} = \sigma_{Y,AC} = 250 \text{ MPa}$

$$CB: \quad \sigma_{CB} = \frac{F_{CB}}{A} = \frac{552.6 \times 10^3}{1750 \times 10^{-6}} = -316 \times 10^6 \text{ Pa} = -316 \text{ MPa}$$
(c) Deflection and forces for unloading.

\[ \delta' = \frac{P'_{AC} L_{AC}}{EA} = -\frac{P'_{CB} L_{CB}}{EA} \quad \therefore \quad P'_{CB} = -P'_{AC} \frac{L_{AC}}{L_{AB}} = -P_{AC} \]

\[ P' = P'_{AC} - P'_{CB} = 2P'_{AC} = 990.1 \times 10^3 \text{ N} \quad \therefore \quad P'_{AC} = 495.05 \times 10^3 \text{ N} \]

\[ \delta' = \frac{(495.05 \times 10^3)(0.190)}{(200 \times 10^3)(1750 \times 10^{-6})} = 0.26874 \times 10^{-3} \text{ m} = 0.26874 \text{ mm} \]

\[ \delta_p = \delta_m - \delta' = 0.30 \text{ mm} - 0.26874 \text{ mm} = 0.031 \text{ mm} \]
PROBLEM 2.111

Two tempered-steel bars, each $\frac{1}{16}$-in. thick, are bonded to a $\frac{1}{2}$-in. mild-steel bar. This composite bar is subjected as shown to a centric axial load of magnitude $P$. Both steels are elastoplastic with $E = 29 \times 10^6$ and with yield strengths equal to 100 ksi and 50 ksi, respectively, for the tempered and mild steel. The load $P$ is gradually increased from zero until the deformation of the bar reaches a maximum value $\delta_m = 0.04$ in. and then decreased back to zero. Determine (a) the maximum value of $P$, (b) the maximum stress in the tempered-steel bars, (c) the permanent set after the load is removed.

SOLUTION

For the mild steel, $A_1 = \left(\frac{1}{2}\right)(2) = 1.00$ in$^2$

$\delta_{y1} = \frac{L\sigma_y}{E} = \frac{(14)(50 \times 10^3)}{29 \times 10^6} = 0.024138$ in.

For the tempered steel, $A_2 = 2\left(\frac{3}{16}\right)(2) = 0.75$ in$^2$

$\delta_{y2} = \frac{L\sigma_y}{E} = \frac{(14)(100 \times 10^3)}{29 \times 10^6} = 0.048276$ in.

Total area: $A = A_1 + A_2 = 1.75$ in$^2$

$\delta_{y1} < \delta_m < \delta_{y2}$. The mild steel yields. Tempered steel is elastic.

(a) Forces: $P_1 = A_1\sigma_{y1} = (1.00)(50 \times 10^3) = 50 \times 10^3$ lb

$P_2 = \frac{EA_2\delta_m}{L} = \frac{(29 \times 10^6)(0.75)(0.04)}{14} = 62.14 \times 10^3$ lb

$P = P_1 + P_2 = 112.14 \times 10^3$ lb = 112.1 kips $\quad P = 112.1$ kips

(b) Stresses: $\sigma_{1} = \frac{P_1}{A_1} = \sigma_{y1} = 50 \times 10^3$ psi = 50 ksi

$\sigma_{2} = \frac{P_2}{A_2} = \frac{62.14 \times 10^3}{0.75} = 82.86 \times 10^3$ psi = 82.86 ksi $\quad 82.86$ ksi

Unloading: $\delta' = \frac{PL}{EA} = \frac{(112.14 \times 10^3)(14)}{(29 \times 10^6)(1.75)} = 0.03094$ in.

(c) Permanent set: $\delta_p = \delta_m - \delta' = 0.04 - 0.03094 = 0.00906$ in. $\quad 0.00906$ in.
PROBLEM 2.112

For the composite bar of Prob. 2.111, if $P$ is gradually increased from zero to 98 kips and then decreased back to zero, determine $(a)$ the maximum deformation of the bar, $(b)$ the maximum stress in the tempered-steel bars, $(c)$ the permanent set after the load is removed.

PROBLEM 2.111 Two tempered-steel bars, each $\frac{3}{16}$-in. thick, are bonded to a $\frac{3}{8}$-in. mild-steel bar. This composite bar is subjected as shown to a centric axial load of magnitude $P$. Both steels are elastoplastic with $E = 29 \times 10^6$ psi and with yield strengths equal to 100 ksi and 50 ksi, respectively, for the tempered and mild steel.

SOLUTION

Areas: Mild steel: $A_1 = \left(\frac{1}{2}\right)(2) = 1.00$ in$^2$

Tempered steel: $A_2 = 2\left(\frac{3}{16}\right)(2) = 0.75$ in$^2$

Total: $A = A_1 + A_2 = 1.75$ in$^2$

Total force to yield the mild steel:

$$\sigma_{y1} = \frac{P_y}{A} \Rightarrow P_y = A\sigma_{y1} = (1.75)(50 \times 10^3) = 87.50 \times 10^3 \text{lb}$$

$P > P_{y1}$, therefore, mild steel yields.

Let $P_1 =$ force carried by mild steel.

$P_2 =$ force carried by tempered steel.

$$P_1 = A_1\sigma_1 = (1.00)(50 \times 10^3) = 50 \times 10^3 \text{lb}$$

$$P_1 + P_2 = P, \quad P_2 = P - P_1 = 98 \times 10^3 - 50 \times 10^3 = 48 \times 10^3 \text{lb}$$

\[\begin{align*}
(a) \quad \delta_m &= \frac{P_2L}{EA_2} = \frac{(48 \times 10^3)(14)}{(29 \times 10^6)(0.75)} = 0.03090 \text{ in.} \\
(b) \quad \sigma_2 &= \frac{P_2}{A_2} = \frac{48 \times 10^3}{0.75} = 64 \times 10^3 \text{ psi} = 64 \text{ksi} \\
\text{Unloading:} \quad \delta' = \frac{PL}{EA} = \frac{(98 \times 10^3)(14)}{(29 \times 10^6)(1.75)} = 0.02703 \text{ in.}
\end{align*}\]

\[c) \quad \delta_p = \delta_m - \delta' = 0.03090 - 0.02703 = 0.00387 \text{in.} \]
PROBLEM 2.113

The rigid bar $ABC$ is supported by two links, $AD$ and $BE$, of uniform $37.5 \times 6$-mm rectangular cross section and made of a mild steel that is assumed to be elastoplastic with $E = 200 \text{ GPa}$ and $\sigma_Y = 250 \text{ MPa}$. The magnitude of the force $Q$ applied at $B$ is gradually increased from zero to $260 \text{ kN}$. Knowing that $a = 0.640 \text{ m}$, determine (a) the value of the normal stress in each link, (b) the maximum deflection of point $B$.

SOLUTION

Statics: $\Sigma M_C = 0$: $0.640(Q - P_{BE}) - 2.64P_{AD} = 0$

Deformation: $\delta_A = 2.64\theta$, $\delta_B = a\theta = 0.640\theta$

Elastic analysis:

$$\begin{align*}
A &= (37.5)(6) = 225 \text{ mm}^2 = 225 \times 10^{-6} \text{ m}^2 \\
P_{AD} &= \frac{EA}{L_{AD}}\delta_A = \frac{(200 \times 10^9)(225 \times 10^{-6})}{1.7}\delta_A = 26.47 \times 10^6 \delta_A \\
&= (26.47 \times 10^6)(2.64\theta) = 69.88 \times 10^6 \theta \\
\sigma_{AD} &= \frac{P_{AD}}{A} = 310.6 \times 10^9 \theta \\
P_{BE} &= \frac{EA}{L_{BE}}\delta_B = \frac{(200 \times 10^9)(225 \times 10^{-6})}{1.0}\delta_B = 45 \times 10^6 \delta_B \\
&= (45 \times 10^6)(0.640\theta) = 28.80 \times 10^6 \theta \\
\sigma_{BE} &= \frac{P_{BE}}{A} = 128 \times 10^9 \theta \\

\text{From Statics, } Q &= P_{BE} + \frac{2.64}{0.640}P_{AD} = P_{BE} + 4.125P_{AD} \\
&= [28.80 \times 10^6 + (4.125)(69.88 \times 10^6)]\theta = 317.06 \times 10^6 \theta \\
\theta_Y \text{ at yielding of link } AD: \quad \sigma_{AD} &= \sigma_Y = 250 \times 10^6 = 310.6 \times 10^9 \theta \\
\theta_Y &= 804.89 \times 10^{-6} \\
Q_Y &= (317.06 \times 10^6)(804.89 \times 10^{-6}) = 255.2 \times 10^3 \text{ N}
\end{align*}
PROBLEM 2.113  (Continued)

(a) Since \( Q = 260 \times 10^3 > Q_Y \), link \( AD \) yields. \( \sigma_{AD} = 250 \) MPa

\[
P_{AD} = A \sigma_Y = (225 \times 10^{-6})(250 \times 10^6) = 56.25 \times 10^3 \text{ N}
\]

From Statics, \( P_{BE} = Q - 4.125P_{AD} = 260 \times 10^3 - (4.125)(56.25 \times 10^3) \)

\[
P_{BE} = 27.97 \times 10^3 \text{ N}
\]

\[
\sigma_{BE} = \frac{P_{BE}}{A} = \frac{27.97 \times 10^3}{225 \times 10^{-6}} = 124.3 \times 10^6 \text{ Pa}
\]

\( \sigma_{BE} = 124.3 \) MPa

(b) \( \delta_B = \frac{P_{BE} \delta_{BE}}{EA} = \frac{(27.97 \times 10^3)(1.0)}{(200 \times 10^9)(225 \times 10^{-6})} = 621.53 \times 10^{-6} \) m

\( \delta_B = 0.622 \) mm

Solve Prob. 2.113, assuming that the magnitude of the force $Q$ applied at $B$ is gradually increased from zero to 260 kN and then decreased back to zero. Knowing that $a = 0.640$ m, determine
- (a) the residual stress in each link,
- (b) the final deflection of point $B$.

Assume that the links are braced so that they can carry compressive forces without buckling.

PROBLEM 2.113

The rigid bar $ABC$ is supported by two links, $AD$ and $BE$, of uniform 37.5\,mm $\times$ 6-mm rectangular cross section and made of a mild steel that is assumed to be elastoplastic with $E = 200$ GPa and $\sigma_y = 250$ MPa. The magnitude of the force $Q$ applied at $B$ is gradually increased from zero to 260 kN. Knowing that $a = 0.640$ m, determine
- (a) the value of the normal stress in each link,
- (b) the maximum deflection of point $B$.

SOLUTION

See solution to Problem 2.113 for the normal stresses in each link and the deflection of Point $B$ after loading.

\[ \sigma_{AD} = 250 \times 10^6 \text{ Pa} \]
\[ \sigma_{BE} = 124.3 \times 10^6 \text{ Pa} \]
\[ \delta_B = 621.53 \times 10^{-6} \text{ m} \]

The elastic analysis given in the solution to Problem 2.113 applies to the unloading.

\[ Q' = 317.06 \times 10^6 \theta' \]
\[ Q' = \frac{Q}{317.06 \times 10^6} = \frac{260 \times 10^3}{317.06 \times 10^6} = 820.03 \times 10^{-6} \]
\[ \sigma'_{AD} = 310.6 \times 10^6 \theta = (310.6 \times 10^6)(820.03 \times 10^{-6}) = 254.70 \times 10^6 \text{ Pa} \]
\[ \sigma'_{BE} = 128 \times 10^6 \theta = (128 \times 10^6)(820.03 \times 10^{-6}) = 104.96 \times 10^6 \text{ Pa} \]
\[ \delta_B' = 0.640 \theta' = 524.82 \times 10^{-6} \text{ m} \]

(a) Residual stresses.

\[ \sigma_{AD,\,\text{res}} = \sigma_{AD} - \sigma'_{AD} = 250 \times 10^6 - 254.70 \times 10^6 = -4.70 \times 10^6 \text{ Pa} = -4.70 \text{ MPa} \]
\[ \sigma_{BE,\,\text{res}} = \sigma_{BE} - \sigma'_{BE} = 124.3 \times 10^6 - 104.96 \times 10^6 = 19.34 \times 10^6 \text{ Pa} = 19.34 \text{ MPa} \]

(b) \[ \delta_{B,\,\text{f}} = \delta_B - \delta_B' = 621.53 \times 10^{-6} - 524.82 \times 10^{-6} = 96.71 \times 10^{-6} \text{ m} = 0.0967 \text{ mm} \]
PROBLEM 2.116

A uniform steel rod of cross-sectional area $A$ is attached to rigid supports and is unstressed at a temperature of 45°F. The steel is assumed to be elastoplastic with $\sigma_y = 36$ ksi and $E = 29 \times 10^6$ psi. Knowing that $\alpha = 6.5 \times 10^{-6}/^\circ F$, determine the stress in the bar (a) when the temperature is raised to 320°F, (b) after the temperature has returned to 45°F.

SOLUTION

Let $P$ be the compressive force in the rod.

Determine temperature change to cause yielding.

\[
\delta = -\frac{PL}{AE} + L\alpha(\Delta T) = -\frac{\sigma_y L}{E} + L\alpha(\Delta T)_y = 0
\]

\[
(\Delta T)_y = \frac{\sigma_y}{E\alpha} = \frac{36 \times 10^3}{(29 \times 10^6)(6.5 \times 10^{-6})} = 190.98^\circ F
\]

But $\Delta T = 320 - 45 = 275^\circ F > (\Delta T)_y$

(a) Yielding occurs. \( \sigma = -\sigma_y = -36 \text{ ksi} \)

Cooling:

\[
(\Delta T)' = 275^\circ F
\]

\[
\delta' = \delta_p' = \delta_f' = -\frac{P'L}{AE} + L\alpha(\Delta T)' = 0
\]

\[
\sigma' = \frac{P'}{A} = -E\alpha(\Delta T)'
\]

\[
= -(29 \times 10^6)(6.5 \times 10^{-6})(275) = -51.8375 \times 10^3 \text{ psi}
\]

(b) Residual stress:

\[
\sigma_{res} = -\sigma_y - \sigma' = -36 \times 10^3 + 51.8375 \times 10^3 = 15.84 \times 10^3 \text{ psi} = 15.84 \text{ ksi}
\]
PROBLEM 2.117

The steel rod ABC is attached to rigid supports and is unstressed at a temperature of 25°C. The steel is assumed elastoplastic, with \( E = 200 \text{ GPa} \) and \( \sigma_y = 250 \text{ MPa} \). The temperature of both portions of the rod is then raised to 150°C. Knowing that \( \alpha = 11.7 \times 10^{-6}/\text{°C} \), determine (a) the stress in both portions of the rod, (b) the deflection of point C.

SOLUTION

\[
A_{AC} = 500 \times 10^{-6} \text{m}^2 \quad L_{AC} = 0.150 \text{ m}
\]
\[
A_{CB} = 300 \times 10^{-6} \text{m}^2 \quad L_{CB} = 0.250 \text{ m}
\]

Constraint:
\[
\delta_p + \delta_T = 0
\]

Determine \( \Delta T \) to cause yielding in portion CB.

\[
\Delta T = \frac{P}{L_{AB} E \alpha} \left( \frac{L_{AC}}{A_{AC}} + \frac{L_{CB}}{A_{CB}} \right)
\]

At yielding, \( P = P_Y = A_{CB} \sigma_Y = (300 \times 10^{-6})(2.50 \times 10^6) = 75 \times 10^3 \text{ N} \)

\[
(\Delta T)_Y = \frac{P_Y}{L_{AB} E \alpha} \left( \frac{L_{AC}}{A_{AC}} + \frac{L_{CB}}{A_{CB}} \right) = \frac{75 \times 10^3}{(0.400)(200 \times 10^9)(11.7 \times 10^{-6})} \left( \frac{0.150}{500 \times 10^{-6}} + \frac{0.250}{300 \times 10^{-6}} \right) = 90.812 \text{ °C}
\]

Actual \( \Delta T \):
\[
150 \text{ °C} - 25 \text{ °C} = 125 \text{ °C} > (\Delta T)_Y
\]

Yielding occurs. For \( \Delta T > (\Delta T)_Y \), \( P = P_Y = 75 \times 10^3 \text{ N} \)

\( a \) \quad \( \sigma_{AC} = -\frac{P_Y}{A_{AC}} = - \frac{75 \times 10^3}{500 \times 10^{-6}} = -150 \times 10^{-6} \text{ Pa} \quad \sigma_{AC} = -150 \text{ MPa} \)

\( \sigma_{CB} = -\frac{P_Y}{A_{CB}} = -\sigma_Y \quad \sigma_{CB} = -250 \text{ MPa} \)

\( b \) \quad For \( \Delta T > (\Delta T)_Y \), portion AC remains elastic.

\[
\delta_{C:A} = \frac{P_Y L_{AC}}{E A_{AC}} + L_{AC} \alpha \Delta T = \frac{(75 \times 10^3)(0.150)}{(200 \times 10^9)(500 \times 10^{-6})} + (0.150)(11.7 \times 10^{-6})(125) = 106.9 \times 10^{-6} \text{ m}
\]

Since Point A is stationary, \( \delta_A = \delta_{C:A} = 106.9 \times 10^{-6} \text{ m} \quad \delta_A = 0.1069 \text{ mm} \)

Determine $\Delta T$ to cause yielding in portion $CB$.

$$\frac{-PL_{AC}}{EA_{AC}} - \frac{PL_{CB}}{EA_{CB}} = L_{AB} \alpha (\Delta T)$$

$$\Delta T = \frac{P}{L_{AB} E \alpha} \left( \frac{L_{AC}}{A_{AC}} + \frac{L_{CB}}{A_{CB}} \right)$$

At yielding, $P = P_Y = A_{CB} \sigma_Y = (300 \times 10^{-6})(250 \times 10^6) = 75 \times 10^3 \text{ N}$

$$(\Delta T)_Y = \frac{P_Y}{L_{AB} E \alpha} \left( \frac{L_{AC}}{A_{AC}} + \frac{L_{CB}}{A_{CB}} \right) = \frac{75 \times 10^3}{(0.400)(200 \times 10^9)(11.7 \times 10^{-6})} \left( \frac{0.150}{500 \times 10^{-6}} + \frac{0.250}{300 \times 10^{-6}} \right)$$

$$= 90.812 °C$$

Actual $\Delta T$: $150 °C - 25 °C = 125 °C > (\Delta T)_Y$

Yielding occurs. For $\Delta T > (\Delta T)_Y \quad P = P_Y = 75 \times 10^3 \text{ N}$

Cooling: $(\Delta T)' = 125 °C \quad P' = \frac{E L_{AB} \alpha (\Delta T)'}{\left( \frac{L_{AC}}{A_{AC}} + \frac{L_{CB}}{A_{CB}} \right)} = \frac{(200 \times 10^9)(0.400)(11.7 \times 10^{-6})(125)}{\left( \frac{0.150}{500 \times 10^{-6}} + \frac{0.250}{300 \times 10^{-6}} \right)} = 103.235 \times 10^3 \text{ N}$

Residual force: $P_{res} = P' - P_Y = 103.235 \times 10^3 - 75 \times 10^3 = 28.235 \times 10^3 \text{ N} \quad \text{ (tension)}$

PROBLEM 2.119*

For the composite bar of Prob. 2.111, determine the residual stresses in the tempered-steel bars if $P$ is gradually increased from zero to 98 kips and then decreased back to zero.

PROBLEM 2.111 Two tempered-steel bars, each $\frac{3}{16}$-in. thick, are bonded to a $\frac{1}{2}$-in. mild-steel bar. This composite bar is subjected as shown to a centric axial load of magnitude $P$. Both steels are elastoplastic with $E = 29 \times 10^6$ psi and with yield strengths equal to 100 ksi and 50 ksi, respectively, for the tempered and mild steel. The load $P$ is gradually increased from zero until the deformation of the bar reaches a maximum value $\delta_m = 0.04$ in. and then decreased back to zero. Determine (a) the maximum value of $P$, (b) the maximum stress in the tempered-steel bars, (c) the permanent set after the load is removed.

SOLUTION

Areas: Mild steel: $A_1 = \left(\frac{1}{2}\right)(2) = 1.00$ in$^2$
Tempered steel: $A_2 = (2)\left(\frac{3}{16}\right)(2) = 0.75$ in$^2$
Total: $A = A_1 + A_2 = 1.75$ in$^2$

Total force to yield the mild steel: $\sigma_{Y1} = \frac{P_Y}{A} \therefore P_Y = A\sigma_{Y1} = (1.75)(50 \times 10^3) = 87.50 \times 10^3$ lb

$P > P_Y$; therefore, mild steel yields.

Let $P_1 = \text{force carried by mild steel}$.
$P_2 = \text{force carried by tempered steel}$.

$P_1 = A_1\sigma_{Y1} = (1.00)(50 \times 10^3) = 50 \times 10^3$ lb

$P_1 + P_2 = P$, $P_2 = P - P_1 = 98 \times 10^3 - 50 \times 10^3 = 48 \times 10^3$ lb

$\sigma_2 = \frac{P_2}{A_2} = \frac{48 \times 10^3}{0.75} = 64 \times 10^3$ psi

Unloading: $\sigma' = \frac{P}{A} = \frac{98 \times 10^3}{1.75} = 56 \times 10^3$ psi

Residual stresses.

Mild steel: $\sigma_{1,\text{res}} = \sigma_1 - \sigma' = 50 \times 10^3 - 56 \times 10^3 = -6 \times 10^3$ psi = $-6$ ksi

Tempered steel: $\sigma_{2,\text{res}} = \sigma_2 - \sigma_1 = 64 \times 10^3 - 56 \times 10^3 = 8 \times 10^3$ psi = 8.00 ksi
PROBLEM 2.120

For the composite bar in Prob. 2.111, determine the residual stresses in the tempered-steel bars if \( P \) is gradually increased from zero until the deformation of the bar reaches a maximum value \( \delta_m = 0.04 \) in. and is then decreased back to zero.

PROBLEM 2.111

Two tempered-steel bars, each \( \frac{3}{32} \)-in. thick, are bonded to a \( \frac{1}{2} \)-in. mild-steel bar. This composite bar is subjected as shown to a centric axial load of magnitude \( P \). Both steels are elastoplastic with \( E = 29 \times 10^6 \) psi and with yield strengths equal to 100 ksi and 50 ksi, respectively, for the tempered and mild steel. The load \( P \) is gradually increased from zero until the deformation of the bar reaches a maximum value \( \delta_m = 0.04 \) in. and then decreased back to zero. Determine (a) the maximum value of \( P \), (b) the maximum stress in the tempered-steel bars, (c) the permanent set after the load is removed.

SOLUTION

For the mild steel,

\[
A_1 = \left( \frac{1}{2} \right) \left( \frac{3}{16} \right) (2) = 1.00 \text{ in}^2 \\
\delta_{\gamma 1} = \frac{L \delta_m}{E} = \frac{(14)(50 \times 10^3)}{29 \times 10^6} = 0.024138 \text{ in.}
\]

For the tempered steel,

\[
A_2 = 2 \left( \frac{3}{16} \right) (2) = 0.75 \text{ in}^2 \\
\delta_{\gamma 2} = \frac{L \delta_m}{E} = \frac{(14)(100 \times 10^3)}{29 \times 10^6} = 0.048276 \text{ in.}
\]

Total area:

\[
A = A_1 + A_2 = 1.75 \text{ in}^2 \\
\delta_{\gamma 1} < \delta_m < \delta_{\gamma 2}
\]

The mild steel yields. Tempered steel is elastic.

Forces:

\[
P_1 = A_1 \delta_{\gamma 1} = (1.00)(50 \times 10^3) = 50 \times 10^3 \text{ lb}
\]

\[
P_2 = \frac{E A_2 \delta_m}{L} = \frac{(29 \times 10^6)(0.75)(0.04)}{14} = 62.14 \times 10^3 \text{ lb}
\]

Stresses:

\[
\sigma_1 = \frac{P_1}{A_1} = \delta_{\gamma 1} = 50 \times 10^3 \text{ psi} \\
\sigma_2 = \frac{P_2}{A_2} = \frac{62.14 \times 10^3}{0.75} = 82.86 \times 10^3 \text{ psi}
\]

Unloading:

\[
\sigma' = \frac{P}{A} = \frac{112.14}{1.75} = 64.08 \times 10^3 \text{ psi}
\]

Residual stresses. \( \sigma_{1,\text{res}} = \sigma_1 - \sigma' = 50 \times 10^3 - 64.08 \times 10^3 = -14.08 \times 10^3 \text{ psi} = -14.08 \text{ ksi} \)

\[
\sigma_{2,\text{res}} = \sigma_2 - \sigma' = 82.86 \times 10^3 - 64.08 \times 10^3 = 18.78 \times 10^3 \text{ psi} = 18.78 \text{ ksi}
\]
PROBLEM 2.121∗

Narrow bars of aluminum are bonded to the two sides of a thick steel plate as shown. Initially, at $T_1 = 70^\circ\text{F}$, all stresses are zero. Knowing that the temperature will be slowly raised to $T_2$ and then reduced to $T_1$, determine (a) the highest temperature $T_2$ that does not result in residual stresses, (b) the temperature $T_2$ that will result in a residual stress in the aluminum equal to 58 ksi. Assume $\alpha_a = 12.8 \times 10^{-6} / \circ\text{F}$ for the aluminum and $\alpha_s = 6.5 \times 10^{-6} / \circ\text{F}$ for the steel. Further assume that the aluminum is elastoplastic, with $E = 10.9 \times 10^6$ psi and $\sigma_Y = 58$ ksi. (Hint: Neglect the small stresses in the plate.)

SOLUTION

Determine temperature change to cause yielding.

$$ \delta = \frac{PL}{EA} + L\alpha_a (\Delta T)_Y = L\alpha_s (\Delta T)_Y $$

$$ \frac{P}{A} = \sigma = -E(\alpha_a - \alpha_s)(\Delta T)_Y = -\sigma_Y $$

$$ (\Delta T)_Y = \frac{\sigma_Y}{E(\alpha_a - \alpha_s)} = \frac{58 \times 10^3}{(10.9 \times 10^6)(12.8 - 6.5)(10^{-6})} = 844.62 \circ\text{F} $$

(a) $T_{2Y} = T_1 + (\Delta T)_Y = 70 + 844.62 = 915 ^\circ\text{F}$

After yielding,

$$ \delta = \frac{\sigma_Y L}{E} + L\alpha_a (\Delta T) = L\alpha_s (\Delta T) $$

Cooling:

$$ \delta' = \frac{P'L}{AE} + L\alpha_a (\Delta T)' = L\alpha_s (\Delta T)' $$

The residual stress is

$$ \sigma_{res} = \sigma_Y - \frac{P'}{A} = \sigma_Y - E(\alpha_a - \alpha_s)(\Delta T) $$

Set $\sigma_{res} = -\sigma_Y$

$$ -\sigma_Y = \sigma_Y - E(\alpha_a - \alpha_s)(\Delta T) $$

$$ \Delta T = \frac{2\sigma_Y}{E(\alpha_a - \alpha_s)} = \frac{(2)(58 \times 10^3)}{(10.9 \times 10^6)(12.8 - 6.5)(10^{-6})} = 1689 \circ\text{F} $$

(b) $T_2 = T_1 + \Delta T = 70 + 1689 = 1759 ^\circ\text{F}$

If $T_2 > 1759 ^\circ\text{F}$, the aluminum bar will most likely yield in compression.

PROBLEM 2.124

Rod $BD$ is made of steel $(E = 29 \times 10^6 \text{ psi})$ and is used to brace the axially compressed member $ABC$. The maximum force that can be developed in member $BD$ is $0.02P$. If the stress must not exceed 18 ksi and the maximum change in length of $BD$ must not exceed 0.001 times the length of $ABC$, determine the smallest-diameter rod that can be used for member $BD$.

SOLUTION

$$F_{BD} = 0.02P = (0.02)(130) = 2.6 \text{ kips} = 2.6 \times 10^3 \text{lb}$$

Considering stress: $\sigma = 18 \text{ ksi} = 18 \times 10^3 \text{ psi}$

$$\sigma = \frac{F_{BD}}{A} \quad \therefore \quad A = \frac{F_{BD}}{\sigma} = \frac{2.6}{18} = 0.14444 \text{ in}^2$$

Considering deformation: $\delta = (0.001)(144) = 0.144 \text{ in.}$

$$\delta = \frac{F_{BD}L_{BD}}{AE} \quad \therefore \quad A = \frac{F_{BD}L_{BD}}{E \delta} = \frac{(2.6 \times 10^3)(54)}{(29 \times 10^6)(0.144)} = 0.03362 \text{ in}^2$$

Larger area governs. $A = 0.14444 \text{ in}^2$

$$A = \frac{\pi}{4} d^2 \quad \therefore \quad d = \sqrt{\frac{4A}{\pi}} = \sqrt{\frac{(4)(0.14444)}{\pi}}$$

$$d = 0.429 \text{ in.} \uparrow$$

    \delta_{AB} &= \frac{P_{AB} L_{AB}}{E_{AB} A_{AB}} = \frac{(40 \times 10^3)(40)}{(29 \times 10^6)(3.1416)} = 17.5619 \times 10^{-3} \text{ in.}

PROBLEM 2.127

The uniform wire ABC, of unstretched length 2l, is attached to the supports shown and a vertical load P is applied at the midpoint B. Denoting by A the cross-sectional area of the wire and by E the modulus of elasticity, show that, for $\delta \ll l$, the deflection at the midpoint B is

$$\delta = \frac{1}{3} \sqrt{\frac{P}{AE}}$$

SOLUTION

Use approximation.

$$\sin \theta = \tan \theta = \frac{\delta}{l}$$

Statics: $\sum F_y = 0: 2P_{AB} \sin \theta - P = 0$

$$P_{AB} = \frac{P}{2 \sin \theta} = \frac{Pl}{2\delta}$$

Elongation: $\delta_{AB} = \frac{P_{AB} l}{AE} = \frac{P l^2}{2AE\delta}$

Deflection:

From the right triangle,

$$(l + \delta_{AB})^2 = l^2 + \delta^2$$

$$\delta^2 = \delta^2 + 2l \delta_{AB} + \delta_{AB}^2 - \delta^2$$

$$= 2l \delta_{AB} \left(1 + \frac{1}{2} \frac{\delta_{AB}}{l}\right) = 2l \delta_{AB}$$

$$= \frac{Pl^3}{AE\delta}$$

$$\delta = \frac{Pl^3}{AE} \therefore \delta = \frac{1}{3} \sqrt{\frac{P}{AE}}$$
**PROBLEM 2.128**

The brass strip $AB$ has been attached to a fixed support at $A$ and rests on a rough support at $B$. Knowing that the coefficient of friction is 0.60 between the strip and the support at $B$, determine the decrease in temperature for which slipping will impend.

**SOLUTION**

Brass strip:

\[ E = 105 \text{ GPa} \]
\[ \alpha = 20 \times 10^{-6}/^\circ \text{C} \]

\[ + \Sigma F_y = 0: \quad N - W = 0 \quad N = W \]
\[ + \Sigma F_x = 0: \quad P - \mu N = 0 \quad P = \mu W = \mu mg \]
\[ \delta = -\frac{PL}{EA} + L\alpha(\Delta T) = 0 \quad \Delta T = \frac{P}{E\alpha} = \frac{\mu mg}{E\alpha} \]

Data:
\[ \mu = 0.60 \]
\[ A = (20)(3) = 60 \text{ mm}^2 = 60 \times 10^{-6} \text{ m}^2 \]
\[ m = 100 \text{ kg} \]
\[ g = 9.81 \text{ m/s}^2 \]
\[ E = 105 \times 10^9 \text{ Pa} \]
\[ \Delta T = \frac{(0.60)(100)(9.81)}{(105 \times 10^9)(60 \times 10^{-6})(20 \times 10^6)} \]
\[ \Delta T = 4.67^\circ \text{C} \]
PROBLEM 2.129

Members $AB$ and $CD$ are $1\frac{1}{8}$-in.-diameter steel rods, and members $BC$ and $AD$ are $\frac{7}{8}$-in.-diameter steel rods. When the turnbuckle is tightened, the diagonal member $AC$ is put in tension. Knowing that $E = 29\times10^6 \text{ psi}$ and $h = 4 \text{ ft}$, determine the largest allowable tension in $AC$ so that the deformations in members $AB$ and $CD$ do not exceed 0.04 in.

SOLUTION

\[
\delta_{AB} = \delta_{CD} = 0.04 \text{ in.}
\]

\[h = 4 \text{ ft} = 48 \text{ in.} = L_{CD}\]

\[A_{CD} = \frac{\pi}{4}d^2 = \frac{\pi}{4}(1.125)^2 = 0.99402 \text{ in}^2\]

\[
\delta_{CD} = \frac{F_{CD}L_{CD}}{EA_{CD}}
\]

\[F_{CD} = \frac{EA_{CD}\delta_{CD}}{L_{CD}} = \frac{(29\times10^6)(0.99402)(0.04)}{48} = 24.022\times10^3 \text{ lb}\]

Use joint $C$ as a free body.

\[+\Sigma F_y = 0: F_{CD} - \frac{4}{5}F_{AC} = 0 \quad \therefore \quad F_{AC} = \frac{5}{4}F_{CD}\]

\[F_{AC} = \frac{5}{4}(24.022\times10^3) = 30.0\times10^3 \text{ lb}\]

\[F_{AC} = 30.0 \text{ kips}\]
PROBLEM 2.130

The 1.5-m concrete post is reinforced with six steel bars, each with a 28-mm diameter. Knowing that $E_s = 200$ GPa and $E_c = 25$ GPa, determine the normal stresses in the steel and in the concrete when a 1550-kN axial centric force $P$ is applied to the post.

SOLUTION

Let $P_c$ = portion of axial force carried by concrete.

$P_s$ = portion carried by the six steel rods.

\[
\delta = \frac{P_c L}{E_c A_c}, \quad P_c = \frac{E_c A_c \delta}{L}
\]

\[
\delta = \frac{P_s L}{E_s A_s}, \quad P_s = \frac{E_s A_s \delta}{L}
\]

\[
P = P_c + P_s = \left(\frac{E_c A_c + E_s A_s}{L}\right) \delta
\]

\[
\varepsilon = \frac{\delta}{L} = \frac{-P}{E_c A_c + E_s A_s}
\]

\[
A_s = \frac{6\pi}{4} d_s^2 = \frac{6\pi}{4} (28)^2 = 3.6945 \times 10^3 \text{ mm}^2
\]

\[
= 3.6945 \times 10^{-3} \text{ m}^2
\]

\[
A_c = \frac{\pi}{4} d_c^2 - A_s = \frac{\pi}{4} (450)^2 - 3.6945 \times 10^3
\]

\[
= 155.349 \times 10^3 \text{ mm}^2
\]

\[
= 153.349 \times 10^{-3} \text{ m}^2
\]

$L = 1.5$ m

\[
\varepsilon = \frac{1550 \times 10^3}{(25 \times 10^9)(155.349 \times 10^3) + (200 \times 10^9)(3.6945 \times 10^{-3})} = 335.31 \times 10^{-6}
\]

\[
\sigma_s = E_s \varepsilon = (200 \times 10^9)(335.31 \times 10^{-6}) = 67.1 \times 10^6 \text{ Pa}
\]

$\sigma_s = 67.1 \text{ MPa} \downarrow$

\[
\sigma_c = E_c \varepsilon = (25 \times 10^9)(-335.31 \times 10^{-6}) = 8.38 \times 10^6 \text{ Pa}
\]

$\sigma_c = 8.38 \text{ MPa} \downarrow$
PROBLEM 2.131

The brass shell (\(\alpha_b = 11.6 \times 10^{-6} / ^\circ F\)) is fully bonded to the steel core (\(\alpha_s = 6.5 \times 10^{-6} / ^\circ F\)). Determine the largest allowable increase in temperature if the stress in the steel core is not to exceed 8 ksi.

SOLUTION

Let \(P_s\) = axial force developed in the steel core.

For equilibrium with zero total force, the compressive force in the brass shell is \(P_s\).

Strains:
\[
\varepsilon_s = \frac{P_s}{E_s A_s} + \alpha_s (\Delta T)
\]
\[
\varepsilon_b = -\frac{P_s}{E_b A_b} + \alpha_b (\Delta T)
\]

Matching:
\[
\varepsilon_s = \varepsilon_b
\]
\[
\frac{P_s}{E_s A_s} + \alpha_s (\Delta T) = -\frac{P_s}{E_b A_b} + \alpha_b (\Delta T)
\]

\[
\left( \frac{1}{E_s A_s} + \frac{1}{E_b A_b} \right) P_s = (\alpha_b - \alpha_s) (\Delta T)
\]

\[
A_b = (1.5)(1.5) - (1.0)(1.0) = 1.25 \text{ in}^2
\]
\[
A_s = (1.0)(1.0) = 1.0 \text{ in}^2
\]
\[
\alpha_b - \alpha_s = 5.1 \times 10^{-6} / ^\circ F
\]
\[
P_s = \sigma_s A_s = (8 \times 10^3)(1.0) = 8 \times 10^3 \text{ lb}
\]
\[
\frac{1}{E_s A_s} + \frac{1}{E_b A_b} = \frac{1}{(29 \times 10^6)(1.0)} + \frac{1}{(15 \times 10^6)(1.25)} = 87.816 \times 10^{-9} \text{ lb}^{-1}
\]

From (1),
\[
(87.816 \times 10^{-9})(8 \times 10^3) = (5.1 \times 10^{-6})(\Delta T)
\]

\[
\Delta T = 137.8 ^\circ F
\]
PROBLEM 2.132

A fabric used in air-inflated structures is subjected to a biaxial loading that results in normal stresses \( \sigma_x = 120 \) MPa and \( \sigma_z = 160 \) MPa. Knowing that the properties of the fabric can be approximated as \( E = 87 \) GPa and \( v = 0.34 \), determine the change in length of (a) side \( AB \), (b) side \( BC \), (c) diagonal \( AC \).

SOLUTION

\( \sigma_x = 120 \times 10^6 \) Pa,  
\( \sigma_y = 0, \)  
\( \sigma_z = 160 \times 10^6 \) Pa

\[ \varepsilon_x = \frac{1}{E}(\sigma_x - v\sigma_y - v\sigma_z) = \frac{1}{87 \times 10^9}[120 \times 10^6 - (0.34)(160 \times 10^6)] = 754.02 \times 10^{-6} \]

\[ \varepsilon_z = \frac{1}{E}(-v\sigma_x - v\sigma_y + \sigma_z) = \frac{1}{87 \times 10^9}[-(0.34)(120 \times 10^6) + 160 \times 10^6] = 1.3701 \times 10^{-3} \]

(a) \( \delta_{AB} = (AB)\varepsilon_x = (100 \text{ mm})(754.02 \times 10^{-6}) \)  
\( \delta_{AB} = 0.0754 \text{ mm} \)

(b) \( \delta_{BC} = (BC)\varepsilon_z = (75 \text{ mm})(1.3701 \times 10^{-3}) \)  
\( \delta_{BC} = 0.1028 \text{ mm} \)

Label sides of right triangle \( ABC \) as \( a \), \( b \), and \( c \).

\[ c^2 = a^2 + b^2 \]

Obtain differentials by calculus.

\[ 2c \, dc = 2a \, da + 2b \, db \]

\[ dc = \frac{a}{c} \, da + \frac{b}{c} \, db \]

But \( a = 100 \) mm,  
\( b = 75 \) mm,  
\( c = \sqrt{(100^2 + 75^2)} = 125 \) mm

\( da = \delta_{AB} = 0.0754 \) mm  
\( db = \delta_{BC} = 0.1028 \) mm

(c) \( \delta_{AC} = dc = \frac{100}{125}(0.0754) + \frac{75}{125}(0.1028) \)  
\( \delta_{AC} = 0.1220 \) mm
PROBLEM 2.133

An elastomeric bearing \((G = 0.9 \text{ MPa})\) is used to support a bridge girder as shown to provide flexibility during earthquakes. The beam must not displace more than 10 mm when a 22-kN lateral load is applied as shown. Knowing that the maximum allowable shearing stress is 420 kPa, determine \((a)\) the smallest allowable dimension \(b\), \((b)\) the smallest required thickness \(a\).

SOLUTION

Shearing force: \[ P = 22 \times 10^3 \text{N} \]

Shearing stress: \[ \tau = 420 \times 10^3 \text{Pa} \]

\[ \tau = \frac{P}{A} \therefore A = \frac{P}{\tau} \]

\[ = \frac{22 \times 10^3}{420 \times 10^3} = 52.381 \times 10^{-3} \text{m}^2 \]

\[ = 52.381 \times 10^3 \text{mm}^2 \]

\[ A = (200 \text{ mm})(b) \]

\((a)\) \[ b = \frac{A}{200} = \frac{52.381 \times 10^3}{200} = 262 \text{ mm} \]

\[ b = 262 \text{ mm} \]

\[ \gamma = \frac{\tau}{G} = \frac{420 \times 10^3}{0.9 \times 10^6} = 466.67 \times 10^{-3} \]

\((b)\) But \[ \gamma = \frac{\delta}{a} \therefore a = \frac{\delta}{\gamma} = \frac{10 \text{ mm}}{466.67 \times 10^{-3}} = 21.4 \text{ mm} \]

\[ a = 21.4 \text{ mm} \]
PROBLEM 2.134

Knowing that \( P = 10 \text{ kips} \), determine the maximum stress when (a) \( r = 0.50 \text{ in.} \), (b) \( r = 0.625 \text{ in.} \).

SOLUTION

\[
P = 10 \times 10^3 \text{ lb} \quad D = 5.0 \text{ in.} \quad d = 2.50 \text{ in.}
\]

\[
\frac{D}{d} = \frac{5.0}{2.50} = 2.00
\]

\[
A_{\text{min}} = \pi \left( \frac{d}{2} \right)^2 = \pi \left( \frac{2.50}{2} \right)^2 = 1.875 \text{ in}^2
\]

(a) \( r = 0.50 \text{ in.} \)

\[
\frac{r}{d} = \frac{0.50}{2.50} = 0.20
\]

From Fig. 2.60b, \( K = 1.94 \)

\[
\sigma_{\text{max}} = \frac{K P}{A_{\text{min}}} = (1.94)(10 \times 10^3) = 10.35 \times 10^3 \text{ psi}
\]

\( 10.35 \text{ ksi} \)

(b) \( r = 0.625 \text{ in.} \)

\[
\frac{r}{d} = \frac{0.625}{2.50} = 0.25 \quad K = 1.82
\]

\[
\sigma_{\text{max}} = \frac{K P}{A_{\text{min}}} = (1.82)(10 \times 10^3) = 9.71 \times 10^3 \text{ psi}
\]

\( 9.71 \text{ ksi} \)
PROBLEM 2.135

The uniform rod $BC$ has a cross-sectional area $A$ and is made of a mild steel that can be assumed to be elasto-plastic with a modulus of elasticity $E$ and a yield strength $\sigma_y$. Using the block-and-spring system shown, it is desired to simulate the deflection of end $C$ of the rod as the axial force $P$ is gradually applied and removed, that is, the deflection of points $C$ and $C'$ should be the same for all values of $P$. Denoting by $\mu$ the coefficient of friction between the block and the horizontal surface, derive an expression for (a) the required mass $m$ of the block, (b) the required constant $k$ of the spring.

SOLUTION

Force-deflection diagram for Point $C$ or rod $BC$.

For $P < \sigma_y$, $\delta_C = \frac{PL}{EA}$, $P = \frac{EA}{L} \delta_C$.

$P_{\text{max}} = \sigma_y A$.

Force-deflection diagram for Point $C'$ of block-and-spring system.

$\Sigma F_y = 0: \quad N - mg = 0 \quad N = mg$

$\Sigma F_x = 0: \quad P - F_f = 0 \quad P = F_f$

If block does not move, i.e., $F_f < \mu N = \mu mg$ or $P < \mu mg$,

then $\delta'_c = \frac{P}{k}$ or $P = k\delta'_c$.

If $P = \mu mg$, then slip at $P = F_m = \mu mg$ occurs.

If the force $P$ is the removed, the spring returns to its initial length.

(a) Equating $P_y$ and $F_{\text{max}}$, $A\sigma_y = \mu mg \quad m = \frac{A\sigma_y}{\mu g}$

(b) Equating slopes, $k = \frac{EA}{L}$.

PROBLEM 3.1

(a) Determine the maximum shearing stress caused by a 4.6-kN \cdot m torque $T$ in the 76-mm-diameter shaft shown. (b) Solve part $a$, assuming that the solid shaft has been replaced by a hollow shaft of the same outer diameter and of 24-mm inner diameter.

SOLUTION

(a) Solid shaft:

$$c = \frac{d}{2} = 38 \text{ mm} = 0.038 \text{ m}$$

$$J = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.038)^4 = 3.2753 \times 10^{-6} \text{ m}^4$$

$$\tau = \frac{Tc}{J} = \frac{(4.6 \times 10^3)(0.038)}{3.2753 \times 10^{-6}} = 53.4 \times 10^6 \text{ Pa}$$

$$\tau = 53.4 \text{ MPa} \uparrow$$

(b) Hollow shaft:

$$c_2 = \frac{d_o}{2} = 0.038 \text{ m}$$

$$c_1 = \frac{1}{2} d_i = 12 \text{ mm} = 0.012 \text{ m}$$

$$J = \frac{\pi}{2} (c_2^4 - c_1^4) = \frac{\pi}{2} (0.038^4 - 0.012^4) = 3.2428 \times 10^{-6} \text{ m}^4$$

$$\tau = \frac{Tc}{J} = \frac{(4.6 \times 10^3)(0.038)}{3.2428 \times 10^{-6}} = 53.9 \times 10^6 \text{ Pa}$$

$$\tau = 53.9 \text{ MPa} \uparrow$$
PROBLEM 3.2

(a) Determine the torque $T$ that causes a maximum shearing stress of 45 MPa in the hollow cylindrical steel shaft shown. (b) Determine the maximum shearing stress caused by the same torque $T$ in a solid cylindrical shaft of the same cross-sectional area.

SOLUTION

(a) Given shaft:

$$J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right)$$

$$J = \frac{\pi}{2} (45^4 - 30^4) = 5.1689 \times 10^6 \text{ mm}^4 = 5.1689 \times 10^{-6} \text{ m}^4$$

$$\tau = \frac{Tc}{J} \quad T = \frac{J \tau}{c}$$

$$T = \frac{(5.1689 \times 10^{-6})(45 \times 10^6)}{45 \times 10^{-3}} = 5.1689 \times 10^3 \text{ N} \cdot \text{m}$$

$$T = 5.17 \text{ kN} \cdot \text{m}$$

(b) Solid shaft of same area:

$$A = \pi \left( c_2^2 - c_1^2 \right) = \pi (45^2 - 30^2) = 3.5343 \times 10^3 \text{ mm}^2$$

$$\pi c^2 = A \quad \text{or} \quad c = \sqrt{\frac{A}{\pi}} = 33.541 \text{ mm}$$

$$J = \frac{\pi}{2} c^4, \quad \tau = \frac{Tc}{J} = \frac{2T}{\pi c^3}$$

$$\tau = \frac{(2)(5.1689 \times 10^3)}{\pi (0.033541)^3} = 87.2 \times 10^6 \text{ Pa}$$

$$\tau = 87.2 \text{ MPa}$$
PROBLEM 3.3

Knowing that $d = 1.2$ in., determine the torque $T$ that causes a maximum shearing stress of 7.5 ksi in the hollow shaft shown.

SOLUTION

$$c_2 = \frac{1}{2} d_2 = \left(\frac{1}{2}\right)(1.6) = 0.8 \text{ in.} \quad c = 0.8 \text{ in.}$$

$$c_1 = \frac{1}{2} d_1 = \left(\frac{1}{2}\right)(1.2) = 0.6 \text{ in.}$$

$$J = \frac{\pi}{2} \left(c_2^4 - c_1^4\right) = \frac{\pi}{2} (0.8^4 - 0.6^4) = 0.4398 \text{ in}^4$$

$$\tau_{\text{max}} = \frac{T c}{J}$$

$$T = \frac{J \tau_{\text{max}}}{c} = \frac{(0.4398)(7.5)}{0.8} \quad T = 4.12 \text{ kip \cdot in}$$
PROBLEM 3.4

Knowing that the internal diameter of the hollow shaft shown is \( d = 0.9 \) in., determine the maximum shearing stress caused by a torque of magnitude \( T = 9 \) kip - in.

\[ T = 9 \text{ kip} \cdot \text{in.} \]

\[ c_2 = \frac{1}{2} d_2 = \left( \frac{1}{2} \right) (1.6) = 0.8 \text{ in.} \quad c = 0.8 \text{ in.} \]

\[ c_1 = \frac{1}{2} d_1 = \left( \frac{1}{2} \right) (0.9) = 0.45 \text{ in.} \]

\[ J = \frac{\pi}{2} (c_2^4 - c_1^4) = \frac{\pi}{2} (0.8^4 - 0.45^4) = 0.5790 \text{ in}^4 \]

\[ \tau_{\text{max}} = \frac{Tc}{J} = \frac{(9)(0.8)}{0.5790} \quad \tau_{\text{max}} = 12.44 \text{ ksi} \]
PROBLEM 3.5

A torque $T = 3 \text{kN} \cdot \text{m}$ is applied to the solid bronze cylinder shown. Determine (a) the maximum shearing stress, (b) the shearing stress at point $D$ which lies on a 15-mm-radius circle drawn on the end of the cylinder, (c) the percent of the torque carried by the portion of the cylinder within the 15 mm radius.

SOLUTION

(a) $c = \frac{1}{2}d = 30 \text{ mm} = 30 \times 10^{-3} \text{ m}$

$J = \frac{\pi}{2}c^4 = \frac{\pi}{2}(30 \times 10^{-3})^4 = 1.27235 \times 10^{-6} \text{ m}^4$

$T = 3 \text{kN} = 3 \times 10^3 \text{ N}$

$\tau_m = \frac{Tc}{J} = \frac{(3 \times 10^3)(30 \times 10^{-3})}{1.27235 \times 10^{-6}} = 70.736 \times 10^6 \text{ Pa}$

$\tau_m = 70.7 \text{ MPa}$

(b) $\rho_D = 15 \text{ mm} = 15 \times 10^{-3} \text{ m}$

$\tau_D = \frac{\rho_D}{c} \tau = \frac{(15 \times 10^{-3})(70.736 \times 10^6)}{(30 \times 10^{-3})}$

$\tau_D = 35.4 \text{ MPa}$

(c) $\tau_D = \frac{T_D \rho_D}{J_D}$

$T_D = \frac{J_D \tau_D}{\rho_D} = \frac{\pi}{2} \rho_D^3 \tau_D$

$T_D = \frac{\pi}{2}(15 \times 10^{-3})^3(35.368 \times 10^6) = 187.5 \text{ N} \cdot \text{m}$

$\frac{T_D}{T} \times 100% = \frac{187.5}{3 \times 10^3}(100%) = 6.25%$

$6.25%$
PROBLEM 3.6

(a) Determine the torque that can be applied to a solid shaft of 20-mm diameter without exceeding an allowable shearing stress of 80 MPa. (b) Solve Part a, assuming that the solid shaft has been replaced by a hollow shaft of the same cross-sectional area and with an inner diameter equal to half of its own outer diameter.

SOLUTION

(a) Solid shaft: 
\[ c = \frac{1}{2} d = \frac{1}{2} (0.020) = 0.010 \text{ m} \]
\[ J = \frac{\pi}{2} c^4 - \frac{\pi}{2} (0.10)^4 = 15.7080 \times 10^{-9} \text{ m}^4 \]
\[ T = \frac{J\tau_{\text{max}}}{c} = \frac{(15.7080 \times 10^{-9})(80 \times 10^6)}{0.010} = 125.664 \quad T = 125.7 \text{ N} \cdot \text{m} \]

(b) Hollow shaft: Same area as solid shaft.
\[ A = \pi \left( c_2^2 - c_1^2 \right) = \pi \left( c_2^2 - \left( \frac{1}{2} c_2 \right)^2 \right) = \frac{3}{4} \pi c_2^2 = \pi c^2 \]
\[ c_2 = \frac{2}{\sqrt{3}} c = \frac{2}{\sqrt{3}} (0.010) = 0.0115470 \text{ m} \]
\[ c_1 = \frac{1}{2} c_2 = 0.0057735 \text{ m} \]
\[ J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} (0.0115470^4 - 0.0057735^4) = 26.180 \times 10^{-9} \text{ m}^4 \]
\[ T = \frac{\tau_{\text{max}} J}{c_2} = \frac{(80 \times 10^6)(26.180 \times 10^{-9})}{0.0115470} = 181.38 \quad T = 181.4 \text{ N} \cdot \text{m} \]
PROBLEM 3.7

The solid spindle $AB$ has a diameter $d_s = 1.5$ in. and is made of a steel with an allowable shearing stress of 12 ksi, while sleeve $CD$ is made of a brass with an allowable shearing stress of 7 ksi. Determine the largest torque $T$ that can be applied at $A$.

SOLUTION

Analysis of solid spindle $AB$: \[ c = \frac{1}{2} d_s = 0.75 \text{ in.} \]

\[ \tau = \frac{Tc}{J} \quad T = \frac{J \tau}{c} = \frac{\pi c^3}{2} \]

\[ T = \frac{\pi}{2} (12 \times 10^3)(0.75)^3 = 7.95 \times 10^3 \text{ lb \cdot in} \]

Analysis of sleeve $CD$: \[ c_2 = \frac{1}{2} d_o = \frac{1}{2} (3) = 1.5 \text{ in.} \]

\[ c_1 = c_2 - t = 1.5 - 0.25 = 1.25 \text{ in.} \]

\[ J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} (1.5^4 - 1.25^4) = 4.1172 \text{ in}^4 \]

\[ T = \frac{J \tau}{c_2} = \frac{(4.1172)(7 \times 10^3)}{1.5} = 19.21 \times 10^3 \text{ lb \cdot in} \]

The smaller torque governs: \[ T = 7.95 \times 10^3 \text{ lb \cdot in} \]

\[ T = 7.95 \text{ kip \cdot in} \]
PROBLEM 3.8

The solid spindle $AB$ is made of a steel with an allowable shearing stress of 12 ksi, and sleeve $CD$ is made of a brass with an allowable shearing stress of 7 ksi. Determine (a) the largest torque $T$ that can be applied at $A$ if the allowable shearing stress is not to be exceeded in sleeve $CD$, (b) the corresponding required value of the diameter $d_s$ of spindle $AB$.

SOLUTION

(a) Analysis of sleeve $CD$:

$$c_2 = \frac{1}{2} d_o = \frac{1}{2} (3) = 1.5 \text{ in.}$$

$$c_1 = c_2 - t = 1.5 - 0.25 = 1.25 \text{ in.}$$

$$J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} (1.5^4 - 1.25^4) = 4.1172 \text{ in}^4$$

$$T = J \tau = \frac{(4.1172)(7 \times 10^3)}{1.5} = 19.21 \times 10^3 \text{ lb \cdot in}$$

$$T = 19.21 \text{ kip \cdot in}$$

(b) Analysis of solid spindle $AB$:

$$\tau = \frac{Tc}{J}$$

$$J = \frac{\pi}{2} c^3 = \frac{T}{\tau} = \frac{19.21 \times 10^3}{12 \times 10^3} = 1.601 \text{ in}^3$$

$$c = \sqrt[3]{\frac{2(1.601)}{\pi}} = 1.006 \text{ in.} \quad d_s = 2c$$

$$d = 2.01 \text{ in.}$$
PROBLEM 3.9

The torques shown are exerted on pulleys $A$ and $B$. Knowing that both shafts are solid, determine the maximum shearing stress $(a)$ in shaft $AB$, $(b)$ in shaft $BC$.

SOLUTION

(a) **Shaft $AB$:**

\[
T_{AB} = 300 \text{ N} \cdot \text{m}, \quad d = 0.030 \text{ m}, \quad c = 0.015 \text{ m}
\]

\[
\tau_{\max} = \frac{T_c}{J} = \frac{2T}{\pi c^3} = \frac{(2)(300)}{\pi(0.015)^3} = 56.588 \times 10^6 \text{ Pa}
\]

\[
\tau_{\max} = 56.6 \text{ MPa}
\]

(b) **Shaft $BC$:**

\[
T_{BC} = 300 + 400 = 700 \text{ N} \cdot \text{m}
\]

\[
d = 0.046 \text{ m}, \quad c = 0.023 \text{ m}
\]

\[
\tau_{\max} = \frac{T_c}{J} = \frac{2T}{\pi c^3} = \frac{(2)(700)}{\pi(0.023)^3} = 36.626 \times 10^6 \text{ Pa}
\]

\[
\tau_{\max} = 36.6 \text{ MPa}
\]
PROBLEM 3.10

In order to reduce the total mass of the assembly of Prob. 3.9, a new design is being considered in which the diameter of shaft $BC$ will be smaller. Determine the smallest diameter of shaft $BC$ for which the maximum value of the shearing stress in the assembly will not increase.

SOLUTION

Shaft $AB$:

$T_{AB} = 300 \text{ N} \cdot \text{m}, \quad d = 0.030 \text{ m}, \quad c = 0.015 \text{ m}$

$$\tau_{\text{max}} = \frac{T_c}{J} = \frac{2T}{\pi c^3} = \frac{(2)(300)}{\pi(0.015)^3}$$

$$= 56.588 \times 10^6 \text{ Pa} = 56.6 \text{ MPa}$$

Shaft $BC$:

$T_{BC} = 300 + 400 = 700 \text{ N} \cdot \text{m}$

$d = 0.46 \text{ m}, \quad c = 0.023 \text{ m}$

$$\tau_{\text{max}} = \frac{T_c}{J} = \frac{2T}{\pi c^3} = \frac{(2)(700)}{\pi(0.023)^3}$$

$$= 36.626 \times 10^6 \text{ Pa} = 36.6 \text{ MPa}$$

The largest stress ($56.588 \times 10^6 \text{ Pa}$) occurs in portion $AB$.

Reduce the diameter of $BC$ to provide the same stress.

$$T_{BC} = 700\text{N} \cdot \text{m} \quad \tau_{\text{max}} = \frac{T_c}{J} = \frac{2T}{\pi c^3}$$

$$c^3 = \frac{2T}{\pi \tau_{\text{max}}} = \frac{(2)(700)}{\pi(56.588 \times 10^6)} = 7.875 \times 10^{-6} \text{m}^3$$

$c = 19.895 \times 10^{-3} \text{ m} \quad d = 2c = 39.79 \times 10^{-3} \text{ m}$

$$d = 39.8 \text{ mm}$$
PROBLEM 3.11

Knowing that each portion of the shafts $AB$, $BC$, and $CD$ consist of a solid circular rod, determine (a) the shaft in which the maximum shearing stress occurs, (b) the magnitude of that stress.

SOLUTION

Shaft $AB$:

$T = 48 \text{ N} \cdot \text{m}$

$c = \frac{1}{2}d = 7.5 \text{ mm} = 0.0075 \text{ m}$

$\tau_{\text{max}} = \frac{Tc}{J} = \frac{2T}{\pi c^3}$

$\tau_{\text{max}} = \frac{(2)(48)}{\pi(0.0075)^3} = 72.433 \text{ MPa}$

Shaft $BC$:

$T = -48 + 144 = 96 \text{ N} \cdot \text{m}$

$c = \frac{1}{2}d = 9 \text{ mm}$

$\tau_{\text{max}} = \frac{Tc}{J} = \frac{2T}{\pi c^3} = \frac{(2)(96)}{\pi(0.009)^3} = 83.835 \text{ MPa}$

Shaft $CD$:

$T = -48 + 144 + 60 = 156 \text{ N} \cdot \text{m}$

$c = \frac{1}{2}d = 10.5 \text{ mm}$

$\tau_{\text{max}} = \frac{Tc}{J} = \frac{2T}{\pi c^3} = \frac{(2 \times 156)}{\pi(0.0105)^3} = 85.79 \text{ MPa}$

Answers: (a) shaft $CD$ (b) 85.8 MPa
PROBLEM 3.12

**SOLUTION**

Hole:
\[ c_1 = \frac{1}{2} d_1 = 4 \text{ mm} \]

Shaft \( AB \):
\[ T = 48 \text{ N} \cdot \text{m} \]
\[ c_2 = \frac{1}{2} d_2 = 7.5 \text{ mm} \]
\[ J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} \left( 0.0075^4 - 0.004^4 \right) = 4.5679 \times 10^{-9} \text{ m}^4 \]
\[ \tau_{\text{max}} = \frac{Tc_2}{J} = \frac{(48)(0.0075)}{4.5679 \times 10^{-9}} = 78.810 \text{ MPa} \]

Shaft \( BC \):
\[ T = -48 + 144 = 96 \text{ N} \cdot \text{m} \]
\[ c_2 = \frac{1}{2} d_2 = 9 \text{ mm} \]
\[ J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} \left( 0.009^4 - 0.004^4 \right) = 9.904 \times 10^{-9} \text{ m}^4 \]
\[ \tau_{\text{max}} = \frac{Tc_2}{J} = \frac{(96)(0.009)}{9.904 \times 10^{-9}} = 87.239 \text{ MPa} \]

Shaft \( CD \):
\[ T = -48 + 144 + 60 = 156 \text{ N} \cdot \text{m} \]
\[ c_2 = \frac{1}{2} d_2 = 10.5 \text{ mm} \]
\[ J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} \left( 0.0105^4 - 0.004^4 \right) = 18.691 \times 10^{-9} \text{ m}^4 \]
\[ \tau_{\text{max}} = \frac{Tc_2}{J} = \frac{(156)(0.0105)}{18.691 \times 10^{-9}} = 87.636 \text{ MPa} \]

Answers: \( a \) shaft \( CD \) \( b \) 87.6 MPa

**SOLUTION**

(a) **Shaft BC:**
From free body shown:
\[ T_{BC} = 3 \text{ kip} \cdot \text{in.} \]

\[
\tau = \frac{Tc}{J} = \frac{Tc}{\frac{1}{2} \pi c^3} = \frac{2}{\pi} \frac{T}{c^3} \quad (1)

\]

\[
\tau = 2.85 \text{ ksi} \quad \blacktriangleright
\]

(b) **Shaft CD:**
From free body shown:
\[ T_{CD} = 3 + 4 = 7 \text{ kip} \cdot \text{in.} \]

From Eq. (1):

\[
\tau = 4.46 \text{ ksi} \quad \blacktriangleright
\]

(c) **Shaft DE:**
From free body shown:
\[ T_{DE} = 12 \text{ kip} \cdot \text{in.} \]

From Eq. (1):

Solve Prob. 3.13, assuming that a 1-in.-diameter hole has been drilled into each shaft.

**PROBLEM 3.13** Under normal operating conditions, the electric motor exerts a 12-kip \cdot in. torque at E. Knowing that each shaft is solid, determine the maximum shearing in (a) shaft BC, (b) shaft CD, (c) shaft DE.

**SOLUTION**

(a) **Shaft BC**:

From free body shown: \( T_{BC} = 3 \text{ kip} \cdot \text{in} \)

\[
c_2 = \frac{1}{2}(1.75) = 0.875 \text{ in.} \quad c_1 = \frac{1}{2}(l) = 0.5 \text{ in.}

\[
J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} \left( 0.875^4 - 0.5^4 \right) = 0.82260 \text{ in}^4

\[
\tau = \frac{T_c}{J} = \frac{(3 \text{ kip} \cdot \text{in})(0.875 \text{ in.})}{0.82260 \text{ in}^4} \quad \tau = 3.19 \text{ ksi} \quad \blacktriangleleft

\[
c_2 = \frac{1}{2}(2.0) = 1.0 \text{ in.}
\]

\[
J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} \left( 1.0^4 - 0.5^4 \right) = 1.47262 \text{ in}^4

\[
\tau = \frac{T_c}{J} = \frac{(7 \text{ kip} \cdot \text{in})(1.0 \text{ in.})}{1.47262 \text{ in}^4} \quad \tau = 4.75 \text{ ksi} \quad \blacktriangleleft

The allowable shearing stress is 15 ksi in the 1.5-in.-diameter steel rod $AB$ and 8 ksi in the 1.8-in.-diameter brass rod $BC$. Neglecting the effect of stress concentrations, determine the largest torque that can be applied at $A$.

SOLUTION

\[ \tau_{\text{max}} = \frac{Tc}{J}, \quad J = \frac{\pi}{2} c^4, \quad T = \frac{\pi}{2} c^3 \tau_{\text{max}} \]

Rod $AB$:

\[ \tau_{\text{max}} = 15 \text{ ksi} \quad c = \frac{1}{2} d = 0.75 \text{ in.} \]

SOLUTION

$$\tau_{\text{max}} = \frac{T_c}{J}, \quad J = \frac{\pi}{2}, \quad c^3 = \frac{2T}{\pi \tau_{\text{max}}}$$

(a) Rod $AB$:

$$T = 10 \text{ kip \cdot in} \quad \tau_{\text{max}} = 15 \text{ ksi}$$

$$c^3 = \frac{(2)(10)}{\pi(15)} = 0.4244 \text{ in}^3$$

$$c = 0.7515 \text{ in.} \quad d = 2c = 1.503 \text{ in.}$$

(b) Rod $BC$:

$$T = 10 \text{ kip \cdot in} \quad \tau_{\text{max}} = 8 \text{ ksi}$$

$$c^3 = \frac{(2)(10)}{\pi(8)} = 0.79577 \text{ in}^2$$

$$c = 0.9267 \text{ in.} \quad d = 2c = 1.853 \text{ in.}$$

The solid rod $BC$ has a diameter of 30 mm and is made of an aluminum for which the allowable shearing stress is 25 MPa. Rod $AB$ is hollow and has an outer diameter of 25 mm; it is made of a brass for which the allowable shearing stress is 50 MPa. Determine (a) the largest inner diameter of rod $AB$ for which the factor of safety is the same for each rod, (b) the largest torque that can be applied at $A$.

SOLUTION

Solid rod $BC$:

$$T_{all} = \frac{\pi}{2} c^3 \tau_{all} = \frac{\pi}{2} (0.015)^3 (25 \times 10^6) = 132.536 \text{ N} \cdot \text{ m}$$

Hollow rod $AB$:

$$\tau_{all} = 50 \times 10^6 \text{ Pa}$$

$$T_{all} = 132.536 \text{ N} \cdot \text{ m}$$

$$c_2 = \frac{1}{2} d_2 = \frac{1}{2} (0.025) = 0.0125 \text{ m}$$

PROBLEM 3.23

Under normal operating conditions, a motor exerts a torque of magnitude \( T_F = 1200 \text{ lb} \cdot \text{in} \) at \( F \). Knowing that \( r_D = 8 \text{ in.} \), \( r_G = 3 \text{ in.} \), and the allowable shearing stress is 10.5 ksi \( \cdot \) in each shaft, determine the required diameter of (a) shaft CDE, (b) shaft FGH.

SOLUTION

\[ T_F = 1200 \text{ lb} \cdot \text{in} \]
\[ T_E = \frac{r_D}{r_G} T_F = \frac{8}{3} (1200) = 3200 \text{ lb} \cdot \text{in} \]
\[ \tau_{\text{all}} = 10.5 \ \text{ksi} = 10500 \ \text{psi} \]
\[ \tau = \frac{T_c}{J} = \frac{2T}{\pi c^3} \quad \text{or} \quad c^3 = \frac{2T}{\pi \tau} \]

(a) Shaft CDE:
\[ c^3 = \frac{(2) (3200)}{\pi (10500)} = 0.194012 \text{ in}^3 \]
\[ c = 0.5789 \text{ in.} \quad d_{DE} = 2c \]
\[ d_{DE} = 1.158 \text{ in.} \]

(b) Shaft FGH:
\[ c^3 = \frac{(2) (1200)}{\pi (10500)} = 0.012757 \text{ in}^3 \]
\[ c = 0.4174 \text{ in.} \quad d_{FG} = 2c \]
\[ d_{FG} = 0.835 \text{ in.} \]
PROBLEM 3.24

Under normal operating conditions, a motor exerts a torque of magnitude $T_F$ at $F$. The shafts are made of a steel for which the allowable shearing stress is 12 ksi and have diameters $d_{CD} = 0.900$ in. and $d_{FG} = 0.800$ in. Knowing that $r_D = 6.5$ in. and $r_G = 4.5$ in., determine the largest allowable value of $T_F$.

SOLUTION

$\tau_{all} = 12$ ksi

Shaft $FG$:

$c = \frac{1}{2} d = 0.400$ in.

$T_{F,all} = \frac{J\tau_{all}}{c} = \frac{\pi}{2} c^3 \tau_{all}$

$= \frac{\pi}{2} (0.400)^3 (12) = 1.206$ kip in

Shaft $DE$:

$c = \frac{1}{2} d = 0.450$ in.

$T_{E,all} = \frac{\pi}{2} c^3 \tau_{all}$

$= \frac{\pi}{2} (0.450)^3 (12) = 1.7177$ kip in

$T_F = \frac{r_G}{r_D} T_E = \frac{4.5}{6.5} (1.7177) = 1.189$ kip in

Allowable value of $T_F$ is the smaller. $T_F = 1.189$ kip in
PROBLEM 3.25

The two solid shafts are connected by gears as shown and are made of a steel for which the allowable shearing stress is 8500 psi. Knowing that a torque of magnitude $T_C = 5 \text{ kip \cdot in.}$ is applied at $C$ and that the assembly is in equilibrium, determine the required diameter of (a) shaft $BC$, (b) shaft $EF$.

\[ \tau_{\text{max}} = 8500 \text{ psi} = 8.5 \text{ ksi} \]

(a) **Shaft BC:**

\[ T_C = 5 \text{ kip \cdot in} \]

\[ \tau_{\text{max}} = \frac{T_C}{J} = \frac{2T}{\pi c^3} \quad c = \sqrt[3]{\frac{2T}{\pi \tau_{\text{max}}}} \]

\[ c = \left( \frac{2 \times 5}{\pi \times 8.5} \right)^{1/3} = 0.7208 \text{ in.} \]

\[ d_{BC} = 2c = 1.442 \text{ in.} \]

(b) **Shaft EF:**

\[ T_F = \frac{r_B}{r_A} T_C = \frac{2.5}{4} (5) = 3.125 \text{ kip \cdot in} \]

\[ c = \sqrt[3]{\frac{2T}{\pi \tau_{\text{max}}}} = \sqrt[3]{\frac{(2)(3.125)}{\pi \times 8.5}} = 0.6163 \text{ in.} \]

\[ d_{EF} = 2c = 1.233 \text{ in.} \]
**PROBLEM 3.26**

The two solid shafts are connected by gears as shown and are made of a steel for which the allowable shearing stress is 7000 psi. Knowing the diameters of the two shafts are, respectively, $d_{BC} = 1.6$ in. and $d_{EF} = 1.25$ in., determine the largest torque $T_C$ that can be applied at $C$.

**SOLUTION**

\[ \tau_{\text{max}} = 7000 \text{ psi} = 7.0 \text{ ksi} \]

Shaft $BC$:

\[ d_{BC} = 1.6 \text{ in.} \]

\[ c = \frac{1}{2}d = 0.8 \text{ in.} \]

\[ T_C = \frac{J\tau_{\text{max}}}{c} = \frac{\pi}{2}\tau_{\text{max}}c^3 = \frac{\pi}{2}(7.0)(0.8)^3 = 5.63 \text{ kip \cdot in} \]

Shaft $EF$:

\[ d_{EF} = 1.25 \text{ in.} \]

\[ c = \frac{1}{2}d = 0.625 \text{ in.} \]

\[ T_F = \frac{J\tau_{\text{max}}}{c} = \frac{\pi}{2}\tau_{\text{max}}c^3 = \frac{\pi}{2}(7.0)(0.625)^3 = 2.684 \text{ kip \cdot in} \]

By statics,

\[ T_C = \frac{T_A}{r_D} T_F = \frac{4}{2.5}(2.684) = 4.30 \text{ kip \cdot in} \]

Allowable value of $T_C$ is the smaller.

\[ T_C = 4.30 \text{ kip \cdot in} \]

$F_{BC} = \frac{T_B}{r_B} = \frac{T_C}{r_C}$

$T_C = \frac{r_C}{r_B} T_B = \frac{60}{25} T = 2.4T$

$T_E = \frac{r_E}{r_D} T_D = \frac{75}{30} (2.4T) = 6T$

PROBLEM 3.29

(a) For a given allowable shearing stress, determine the ratio $T/w$ of the maximum allowable torque $T$ and the weight per unit length $w$ for the hollow shaft shown. (b) Denoting by $(T/w)_0$ the value of this ratio for a solid shaft of the same radius $c_2$, express the ratio $T/w$ for the hollow shaft in terms of $(T/w)_0$ and $c_1/c_2$.

SOLUTION

$w = \text{weight per unit length},$

$\rho g = \text{specific weight},$

$W = \text{total weight},$

$L = \text{length}$

$$w = \frac{W}{L} = \frac{\rho g L A}{L} = \rho g A = \rho g \pi \left( c_2^2 - c_1^2 \right)$$

$$T_{\text{all}} = \frac{J \tau_{\text{all}}}{c_2} = \frac{\pi}{2} \frac{c_2^4 - c_1^4}{c_2} \tau_{\text{all}} = \frac{\pi}{2} \left( \frac{c_2^2 + c_1^2}{c_2^2} \right) \left( c_2^2 - c_1^2 \right) \tau_{\text{all}}$$

(a) $\frac{T}{W} = \left( c_1^2 + c_2^2 \right) \tau_{\text{all}}$

$$\frac{T}{w} = \frac{\left( c_1^2 + c_2^2 \right) \tau_{\text{all}}}{2 \rho gc_2} \quad \text{(hollow shaft)}$$

$c_1 = 0$ for solid shaft:

(b) $\frac{(T/w)_h}{(T/w)_0} = 1 + \frac{c_1^2}{c_2^2}$

$$\left( \frac{T}{w} \right)_0 = \frac{c_2 \tau_{\text{all}}}{2 \rho g} \quad \text{(solid shaft)}$$

$$\left( \frac{T}{w} \right) = \left( \frac{T}{w} \right)_0 \left( 1 + \frac{c_1^2}{c_2^2} \right)$$
**PROBLEM 3.30**

While the exact distribution of the shearing stresses in a hollow-cylindrical shaft is as shown in Fig. a, an approximate value can be obtained for $\tau_{\text{max}}$ by assuming that the stresses are uniformly distributed over the area $A$ of the cross section, as shown in Fig. b, and then further assuming that all of the elementary shearing forces act at a distance from $O$ equal to the mean radius $\frac{1}{2}(c_1 + c_2)$ of the cross section. This approximate value $\tau_0 = \frac{T}{Ar_m}$, where $T$ is the applied torque. Determine the ratio $\frac{\tau_{\text{max}}}{\tau_0}$ of the true value of the maximum shearing stress and its approximate value $\tau_0$ for values of $c_1/c_2$, respectively equal to 1.00, 0.95, 0.75, 0.50, and 0.

**SOLUTION**

For a hollow shaft:

$$\tau_{\text{max}} = \frac{Tc_2}{J} = \frac{2Tc_2}{\pi(c_2^4 - c_1^4)} = \frac{2Tc_2}{\pi(c_2^2 - c_1^2)(c_2^2 + c_1^2)} = \frac{2Tc_2}{A(c_2^2 + c_1^2)}$$

By definition,

$$\tau_0 = \frac{T}{Ar_m} = \frac{2T}{A(c_2 + c_1)}$$

Dividing,

$$\frac{\tau_{\text{max}}}{\tau_0} = \frac{c_2(c_2 + c_1)}{c_2^2 + c_1^2} = \frac{1 + (c_1/c_2)}{1 + (c_1/c_2)^2}$$

\[\varphi = 4^\circ = 69.813 \times 10^{-3} \text{ rad}, \quad L = 1.25 \text{ m}\]

\[G = 27 \text{ GPa} = 27 \times 10^9 \text{ Pa}\]

\[J = \frac{\pi}{2} \left(c_2^4 - c_1^4\right) = \frac{\pi}{2} \left(0.018^4 - 0.012^4\right) = 132.324 \times 10^{-9} \text{ m}^4\]

SOLUTION

\[
\begin{align*}
L &= 10 \text{ ft} = 120 \text{ in.} \quad \varphi = 30^\circ = \frac{30\pi}{180} = 0.52360 \text{ rad} \\

PROBLEM 3.34

While an oil well is being drilled at a depth of 6000 ft, it is observed that the top of the 8-in.-diameter steel drill pipe rotates through two complete revolutions before the drilling bit starts to rotate. Using $G = 11.2 \times 10^6$ psi, determine the maximum shearing stress in the pipe caused by torsion.

SOLUTION

For outside diameter of 8 in., $c = 4$ in.

For two revolutions, $\phi = 2(2\pi) = 4\pi$ radians.

$G = 11.2 \times 10^6$ psi

$L = 6000 \text{ ft} = 72000 \text{ in.}$

From textbook,

\[ \phi = \frac{TL}{GJ} \]  

(1)

\[ \tau_m = \frac{Tc}{J} \]  

(2)

Divide (2) by (1).

\[ \frac{\tau_m}{\phi} = \frac{Gc}{L} \]

\[ \tau_m = \frac{Gc\phi}{L} = \frac{(11 \times 10^6)(4)(4\pi)}{72000} = 7679 \text{ psi} \]

\[ \tau_m = 7.68 \text{ ksi} \]

The aluminum rod \( BC \) \((G = 26 \text{ GPa})\) is bonded to the brass rod \( AB \) \((G = 39 \text{ GPa})\). Knowing that each rod is solid and has a diameter of 12 mm, determine the angle of twist \((a)\) at \( B \), \((b)\) at \( C \).

SOLUTION

Both portions:

\[
c = \frac{1}{2} d = 6 \text{ mm} = 6 \times 10^{-3} \text{ m}

\[
T = 100 \text{ N} \cdot \text{m}
\]

Rod \( AB \):

\[
G_{AB} = 39 \times 10^9 \text{ Pa}, \quad L_{AB} = 0.200 \text{ m}
\]

\[
\phi_B = \phi_{AB} = \frac{T L_{AB}}{G_{AB} J} = \frac{(100)(0.200)}{(39 \times 10^9)(2.03575 \times 10^{-9})} = 0.25191 \text{ rad}

\[
\phi_B = 14.43^\circ

PROBLEM 3.38

The aluminum rod $AB$ ($G = 27 \text{ GPa}$) is bonded to the brass rod $BD$ ($G = 39 \text{ GPa}$). Knowing that portion $CD$ of the brass rod is hollow and has an inner diameter of 40 mm, determine the angle of twist at $A$.

SOLUTION

Rod $AB$:  

$G = 27 \times 10^9 \text{ Pa}$,  

$L = 0.400 \text{ m}$  

$T = 800 \text{ N} \cdot \text{m}$  

$c = \frac{1}{2}d = 0.018 \text{ m}$  

$J = \frac{\pi}{2}c^4 = \frac{\pi}{2}(0.018)^4 = 164.896 \times 10^{-9} \text{ m}^4$  

$\varphi_{AB} = \frac{T L}{G J} = \frac{(800)(0.400)}{(27 \times 10^9)(164.896 \times 10^{-9})} = 71.875 \times 10^{-3} \text{ rad}$

Part $BC$:  

$G = 39 \times 10^9 \text{ Pa}$  

$L = 0.375 \text{ m}$  

$c = \frac{1}{2}d = 0.030 \text{ m}$  

$T = 800 + 1600 = 2400 \text{ N} \cdot \text{m}$,  

$J = \frac{\pi}{2}c^4 = \frac{\pi}{2}(0.030)^4 = 1.27234 \times 10^{-6} \text{ m}^4$  

$\varphi_{BC} = \frac{T L}{G J} = \frac{(2400)(0.375)}{(39 \times 10^9)(1.27234 \times 10^{-6})} = 18.137 \times 10^{-3} \text{ rad}$

Part $CD$:  

$c_1 = \frac{1}{2}d_1 = 0.020 \text{ m}$  

$c_2 = \frac{1}{2}d_2 = 0.030 \text{ m}$,  

$L = 0.250 \text{ m}$  

$J = \frac{\pi}{2}(c_2^4 - c_1^4) = \frac{\pi}{2}(0.030^4 - 0.020^4) = 1.02102 \times 10^{-6} \text{ m}^4$  

$\varphi_{CD} = \frac{T L}{G J} = \frac{(2400)(0.250)}{(39 \times 10^9)(1.02102 \times 10^{-6})} = 15.068 \times 10^{-3} \text{ rad}$

Angle of twist at $A$.  

$\varphi_A = \varphi_{AB} + \varphi_{BC} + \varphi_{CD}$

PROBLEM 3.39

The solid spindle $AB$ has a diameter $d_s = 1.5$ in. and is made of a steel with $G = 11.2 \times 10^6$ psi and $\tau_{all} = 12$ ksi, while sleeve $CD$ is made of a brass with $G = 5.6 \times 10^6$ psi and $\tau_{all} = 7$ ksi. Determine the angle through end $A$ can be rotated.

SOLUTION

Stress analysis of solid spindle $AB$:

\[ c = \frac{1}{2} d_s = 0.75 \text{ in.} \]

\[ \tau = \frac{T_c}{J} \quad T = \frac{J \tau}{c} = \frac{\pi}{2} tc^3 \]

\[ T = \frac{\pi}{2} (12 \times 10^3)(0.75)^3 = 7.95 \times 10^3 \text{ lb} \cdot \text{in} \]

Stress analysis of sleeve $CD$:

\[ c_2 = \frac{1}{2} d_o = \frac{1}{2} (3) = 1.5 \text{ in.} \]

\[ c_1 = c_2 - t = 1.5 - 0.25 = 1.25 \text{ in.} \]

\[ J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} (1.5^4 - 1.25^4) = 4.1172 \text{ in}^4 \]

\[ T = \frac{J \tau}{c_2} = \frac{(4.1172)(7 \times 10^{-3})}{1.5} = 19.21 \times 10^3 \text{ lb} \cdot \text{in} \]

The smaller torque governs. 

\[ T = 7.95 \times 10^3 \text{ lb} \cdot \text{in} \]

Deformation of spindle $AB$:

\[ c = 0.75 \text{ in.} \]

\[ J = \frac{\pi}{2} c^4 = 0.49701 \text{ in}^4, \quad L = 12 \text{ in.,} \quad G = 11.2 \times 10^6 \text{ psi} \]

\[ \varphi_{AB} = \frac{TL}{GJ} = \frac{(7.95 \times 10^3)(12)}{(11.2 \times 10^6)(0.49701)} = 0.017138 \text{ radians} \]

Deformation of sleeve $CD$:

\[ J = 4.1172 \text{ in}^4, \quad L = 8 \text{ in.,} \quad G = 5.6 \times 10^6 \text{ psi} \]

\[ \varphi_{CD} = \frac{TL}{GJ} = \frac{(7.95 \times 10^3)(8)}{(5.6 \times 10^6)(4.1172)} = 0.002758 \text{ radians} \]

Total angle of twist:

\[ \varphi_{AD} = \varphi_{AB} + \varphi_{CD} = 0.019896 \text{ radians} \]

\[ \varphi_{AD} = 1.140^\circ \]
PROBLEM 3.40

The solid spindle $AB$ has a diameter $d_s = 1.75\text{ in.}$ and is made of a steel with $G = 11.2 \times 10^6 \text{ psi}$ and $\tau_{\text{all}} = 12 \text{ ksi}$, while sleeve $CD$ is made of a brass with $G = 5.6 \times 10^6 \text{ psi}$ and $\tau_{\text{all}} = 7 \text{ ksi}$. Determine $(a)$ the largest torque $T$ that can be applied at $A$ if the given allowable stresses are not to be exceeded and if the angle of twist of sleeve $CD$ is not to exceed $0.375^\circ$, $(b)$ the corresponding angle through which end $A$ rotates.

SOLUTION

Spindle $AB$: 

\[ c = \frac{1}{2} (1.75 \text{ in.}) = 0.875 \text{ in.} \quad L = 12 \text{ in.} \quad \tau_{\text{all}} = 12 \text{ ksi} \quad G = 11.2 \times 10^6 \text{ psi} \]

\[ J = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.875)^4 = 0.92077 \text{ in}^4 \]

Sleeve $CD$: 

\[ c_1 = 1.25 \text{ in.} \quad c_2 = 1.5 \text{ in.} \quad L = 8 \text{ in.} \quad \tau_{\text{all}} = 7 \text{ ksi} \]

\[ J = \frac{\pi}{2} (c_2^4 - c_1^4) = 4.1172 \text{ in}^4 \quad G = 5.6 \times 10^6 \text{ psi} \]

(a) Largest allowable torque $T$.

Criterion: Stress in spindle $AB$.

\[ \tau = \frac{Tc}{J} \quad T = \frac{J\tau}{c} \]

\[ T = \frac{(0.92077)(12)}{0.875} = 12.63 \text{ kip \cdot in} \]

Criterion: Stress in sleeve $CD$.

\[ T = \frac{J\tau}{c_2} = \frac{4.1172 \text{ in}^4}{1.5 \text{ in.}}(7 \text{ ksi}) \quad T = 19.21 \text{ kip \cdot in} \]

Criterion: Angle of twist of sleeve $CD$. 

\[ \phi = 0.375^\circ = 6.545 \times 10^{-3} \text{ rad} \]

\[ \phi = \frac{TL}{JG} \quad T = \frac{JG}{L} \phi = \frac{(4.1172)(5.6 \times 10^6)}{8}(6.545 \times 10^{-3}) \]

\[ T = 18.86 \text{ kip \cdot in} \]

The largest allowable torque is $T = 12.63 \text{ kip \cdot in}$.

(b) Angle of rotation of end $A$.

\[ \phi_A = \phi_{A/D} + \phi_{A/B} + \phi_{C/D} = \sum \frac{T_i L_i}{J_i G_i} = T \sum \frac{L_i}{J_i G_i} \]

\[ = (12.63 \times 10^3)\left[ \frac{12}{(0.92077)(11.2 \times 10^6)} + \frac{8}{(4.1172)(5.6 \times 10^6)} \right] \]

\[ = 0.01908 \text{ radians} \quad \phi_A = 1.093^\circ \]
PROBLEM 3.41

Two shafts, each of \( \frac{7}{8} \)-in. diameter, are connected by the gears shown. Knowing that \( G = 11.2 \times 10^6 \text{ psi} \) and that the shaft at \( F \) is fixed, determine the angle through which end \( A \) rotates when a 1.2 kip \( \cdot \) in. torque is applied at \( A \).

SOLUTION

Calculation of torques.

Circumferential contact force between gears \( B \) and \( E \). \( F = \frac{T_{AB}}{r_B} = \frac{T_{EF}}{r_E} = \frac{r_E}{r_B} T_{AB} \)

\[
T_{AB} = 1.2 \text{ kip \cdot in} = 1200 \text{ lb \cdot in} \\
T_{EF} = 6 \frac{1200}{4.5} = 1600 \text{ lb \cdot in}
\]

Twist in shaft \( FE \).

\[
L = 12 \text{ in}, \quad c = \frac{1}{2}d = \frac{7}{16} \text{ in}, \quad G = 11.2 \times 10^6 \text{ psi} \\
J = \frac{\pi}{2} c^4 = \frac{\pi}{2} \left(\frac{7}{16}\right)^4 = 57.548 \times 10^{-3} \text{ in}^4 \\
\phi_{EF} = \frac{TL}{GJ} = \frac{(1600)(12)}{(11.2 \times 10^6)(57.548 \times 10^{-3})} = 29.789 \times 10^{-3} \text{ rad}
\]

Rotation at \( E \).

\( \phi_E = \phi_{EF} = 29.789 \times 10^{-3} \text{ rad} \)

Tangential displacement at gear circle. \( \delta = r_E \phi_E = r_B \phi_B \)

Rotation at \( B \).

\( \phi_B = \frac{r_E}{r_B} \phi_E = \frac{6}{4.5} (29.789 \times 10^{-3}) = 39.718 \times 10^{-3} \text{ rad} \)

Twist in shaft \( BA \).

\( L = 8 + 6 = 14 \text{ in}, \quad J = 57.548 \times 10^{-3} \text{ in}^4 \)

\( \phi_{AB} = \frac{TL}{GJ} = \frac{(1200)(14)}{(11.2 \times 10^6)(57.548 \times 10^{-3})} = 26.065 \times 10^{-3} \text{ rad} \)

Rotation at \( A \).

\( \phi_A = \phi_B + \phi_{AB} = 65.783 \times 10^{-3} \text{ rad} \)

\( \phi_A = 3.77^\circ \)

PROBLEM 3.43

A coder $F$, used to record in digital form the rotation of shaft $A$, is connected to the shaft by means of the gear train shown, which consists of four gears and three solid steel shafts each of diameter $d$. Two of the gears have a radius $r$ and the other two a radius $nr$. If the rotation of the coder $F$ is prevented, determine in terms of $T$, $l$, $G$, $J$, and $n$ the angle through which end $A$ rotates.

SOLUTION

\[ T_{AB} = T_A \]
\[ T_{CD} = \frac{r_C}{r_B} T_{AB} = \frac{T_{AB}}{n} = \frac{T_A}{n} \]
\[ T_{EF} = \frac{r_E}{r_D} T_{CD} = \frac{T_{CD}}{n^2} = \frac{T_A}{n^2} \]
\[ \varphi_E = \varphi_{EF} = \frac{T_{EF} l_{EF}}{GJ} = \frac{T_A l}{n^3 GJ} \]
\[ \varphi_D = \frac{r_E}{r_D} \varphi_E = \frac{T_A l}{n^3 GJ} \]
\[ \varphi_{CD} = \frac{T_{CD} l_{CD}}{GJ} = \frac{T_A l}{n GJ} \]
\[ \varphi_C = \varphi_D + \varphi_{CD} = \frac{T_A l}{n^3 GJ} + \frac{T_A l}{n GJ} = \frac{T_A l}{GJ} \left( \frac{1}{n^3} + \frac{1}{n} \right) \]
\[ \varphi_B = \frac{r_C}{r_B} \varphi_C = \frac{T_A l}{n} \left( \frac{1}{n^4} + \frac{1}{n^2} \right) \]
\[ \varphi_{AB} = \frac{T_{AB} l_{AB}}{GJ} = \frac{T_A l}{GJ} \]
\[ \varphi_A = \varphi_B + \varphi_{AB} = \frac{T_A l}{GJ} \left( \frac{1}{n^4} + \frac{1}{n^2} + 1 \right) \]
PROBLEM 3.44
For the gear train described in Prob. 3.43, determine the angle through which end $A$ rotates when $T = 5$ lb-in., $l = 2.4$ in., $d = 1/16$ in., $G = 11.2 \times 10^6$ psi, and $n = 2$.

PROBLEM 3.43 A coder $F$, used to record in digital form the rotation of shaft $A$, is connected to the shaft by means of the gear train shown, which consists of four gears and three solid steel shafts each of diameter $d$. Two of the gears have a radius $r$ and the other two a radius $nr$. If the rotation of the coder $F$ is prevented, determine in terms of $T$, $l$, $G$, $J$, and $n$ the angle through which end $A$ rotates.

SOLUTION
See solution to Prob. 3.43 for development of equation for $\varphi_A$.

\[
\varphi_A = \frac{Tl}{GJ} \left(1 + \frac{1}{n^2} + \frac{1}{n^4}\right)
\]

Data: $T = 5$ lb-in, $l = 2.4$ in., $d = \frac{1}{32}$ in., $G = 11.2 \times 10^6$ psi

$n = 2$, $J = \frac{\pi}{2} e^4 = \frac{\pi}{2} \left(\frac{1}{32}\right)^4 = 1.49803 \times 10^{-6}$ in$^4$

$\varphi_A = \frac{(5)(2.4)}{(11.2 \times 10^6)(1.49803 \times 10^{-6})} \left(1 + \frac{1}{4} + \frac{1}{16}\right) = 938.73 \times 10^{-3}$ rad

$\varphi_A = 53.8^\circ \blacksquare$
PROBLEM 3.45

The design of the gear-and-shaft system shown requires that steel shafts of the same diameter be used for both $AB$ and $CD$. It is further required that $\tau_{\text{max}} \leq 60 \text{ MPa}$, and that the angle $\phi_D$ through which end $D$ of shaft $CD$ rotates not exceed $1.5^\circ$. Knowing that $G = 77 \text{ GPa}$, determine the required diameter of the shafts.

SOLUTION

$$T_{CD} = T_D = 1000 \text{ N} \cdot \text{m} \quad T_{AB} = \frac{r_B T_{CD}}{r_C} = \frac{100}{40} (1000) = 2500 \text{ N} \cdot \text{m}$$

For design based on stress, use larger torque. $T_{AB} = 2500 \text{ N} \cdot \text{m}$

$$\tau = \frac{Tc}{J} = \frac{2T}{\pi c^3}$$

$$c^3 = \frac{2T}{\pi \tau} = \frac{(2)(2500)}{\pi (60 \times 10^6)} = 26.526 \times 10^{-6} \text{ m}^3$$

$$c = 29.82 \times 10^{-3} \text{ m} = 29.82 \text{ mm}, \quad d = 2c = 59.6 \text{ mm}$$

Design based on rotation angle. $\phi_D = 1.5^\circ = 26.18 \times 10^{-3} \text{ rad}$

Shaft $AB$:

$$T_{AB} = 2500 \text{ N} \cdot \text{m}, \quad L = 0.4 \text{ m}$$

$$\phi_{AB} = \frac{TL}{GJ} = \frac{(2500)(0.4)}{GJ} = 1000 \frac{GJ}{GJ}$$

Gears:

$$\phi_B = \frac{1000}{GJ}$$

$$\phi_C = \frac{r_B}{r_C} \phi_B = \left(\frac{100}{40}\right) \left(\frac{1000}{GJ}\right) = \frac{2500}{GJ}$$

Shaft $CD$:

$$T_{CD} = 1000 \text{ N} \cdot \text{m}, \quad L = 0.6 \text{ m}$$

$$\phi_{CD} = \frac{TL}{GJ} = \frac{(1000)(0.6)}{GJ} = 600 \frac{GJ}{GJ}$$

$$\phi_D = \phi_C + \phi_{CD} = \frac{2500}{GJ} + \frac{600}{GJ} = \frac{3100}{GJ} = \frac{3100}{GJ G \frac{\pi}{2} c^4}$$

$$c^4 = \frac{(2)(3100)}{\pi G \phi_D} = \frac{(2)(3100)}{\pi (77 \times 10^9)(26.18 \times 10^{-3})} = 979.06 \times 10^{-9} \text{ m}^4$$

$$c = 31.46 \times 10^{-3} \text{ m} = 31.46 \text{ mm}, \quad d = 2c = 62.9 \text{ mm}$$

Design must use larger value for $d$. $\quad d = 62.9 \text{ mm}$
PROBLEM 3.46

The electric motor exerts a torque of 800 N \cdot m on the steel shaft $ABCD$ when it is rotating at constant speed. Design specifications require that the diameter of the shaft be uniform from $A$ to $D$ and that the angle of twist between $A$ to $D$ not exceed 1.5°. Knowing that $\tau_{\text{max}} \leq 60 \text{ MPa}$ and $G = 77 \text{ GPa}$, determine the minimum diameter shaft that can be used.

SOLUTION

Torques:

$T_{AB} = 300 + 500 = 800 \text{ N} \cdot \text{m}$

$T_{BC} = 500 \text{ N} \cdot \text{m}$, $T_{CD} = 0$

Design based on stress.

$\tau = 60 \times 10^6 \text{ Pa}$

$\tau = \frac{T_c}{J} = \frac{2T}{\pi c^3}$

$c^3 = \frac{2T}{\pi \tau} = \frac{(2)(800)}{\pi (60 \times 10^6)} = 8.488 \times 10^{-6} \text{ m}^3$

$c = 20.40 \times 10^{-3} \text{ m} = 20.40 \text{ mm}$, $d = 2c = 40.8 \text{ mm}$

Design based on deformation.

$\varphi_{D/A} = 1.5° = 26.18 \times 10^{-3} \text{ rad}$

$\varphi_{D/C} = 0$

$\varphi_{C/B} = \frac{T_{BC}L_{BC}}{GJ} = \frac{(500)(0.6)}{GJ} = \frac{300}{GJ}$

$\varphi_{B/A} = \frac{T_{AB}L_{AB}}{GJ} = \frac{(800)(0.4)}{GJ} = \frac{320}{GJ}$

$\varphi_{D/A} = \varphi_{D/C} + \varphi_{C/B} + \varphi_{B/A} = \frac{620}{GJ} = \frac{620}{GJ} = \frac{(2)(620)}{\pi Gc^4} = \frac{(2)(620)}{\pi Gc^4}$

$c^4 = \frac{(2)(620)}{\pi G\varphi_{D/A}} = \frac{(2)(620)}{\pi (77 \times 10^9)(26.18 \times 10^{-3})} = 195.80 \times 10^{-9} \text{ m}^4$

$c = 21.04 \times 10^{-3} \text{ m} = 21.04 \text{ mm}$, $d = 2c = 42.1 \text{ mm}$

Design must use larger value of $d$.

$d = 42.1 \text{ mm}$
PROBLEM 3.47

The design specifications of a 2-m-long solid circular transmission shaft require that the angle of twist of the shaft not exceed 3° when a torque of 9 kN m is applied. Determine the required diameter of the shaft, knowing that the shaft is made of (a) a steel with an allowable shearing stress of 90 MPa and a modulus of rigidity of 77 GPa, (b) a bronze with an allowable shearing of 35 MPa and a modulus of rigidity of 42 GPa.

SOLUTION

\[ \varphi = 3^\circ = 52.360 \times 10^{-3} \text{ rad}, \quad T = 9 \times 10^3 \text{ N} \cdot \text{m} \quad L = 2.0 \text{ m} \]
\[ \varphi = \frac{TL}{GJ} = \frac{2T}{\pi c^4 G} \] based on twist angle.
\[ \tau = \frac{Tc}{J} = \frac{2T}{\pi c^3} \] based on shearing stress.

(a) Steel shaft:
\[ \tau = 90 \times 10^6 \text{ Pa}, \quad G = 77 \times 10^9 \text{ Pa} \]
Based on twist angle,
\[ c^4 = \frac{(2)(9 \times 10^3)(2.0)}{\pi(77 \times 10^9)(52.360 \times 10^{-3})} = 2.842 \times 10^{-6} \text{ m}^4 \]
\[ c = 41.06 \times 10^{-3} \text{ m} = 41.06 \text{ mm} \quad d = 2c = 82.1 \text{ mm} \]
Based on shearing stress,
\[ c^3 = \frac{(2)(9 \times 10^3)}{\pi(90 \times 10^6)} = 63.662 \times 10^{-6} \text{ m}^3 \]
\[ c = 39.93 \times 10^{-3} \text{ m} = 39.93 \text{ mm} \quad d = 2c = 79.9 \text{ mm} \]
Required value of \( d \) is the larger. \( d = 82.1 \text{ mm} \)

(b) Bronze shaft:
\[ \tau = 35 \times 10^6 \text{ Pa}, \quad G = 42 \times 10^9 \text{ Pa} \]
Based on twist angle,
\[ c^4 = \frac{(2)(9 \times 10^3)(2.0)}{\pi(42 \times 10^9)(52.360 \times 10^{-3})} = 5.2103 \times 10^{-6} \text{ m}^4 \]
\[ c = 47.78 \times 10^{-3} \text{ m} = 47.78 \text{ mm} \quad d = 2c = 95.6 \text{ mm} \]
Based on shearing stress,
\[ c^3 = \frac{(2)(9 \times 10^3)}{\pi(35 \times 10^6)} = 163.702 \times 10^{-6} \text{ m}^3 \]
\[ c = 54.70 \times 10^{-3} \text{ m} = 54.70 \text{ mm} \quad d = 2c = 109.4 \text{ mm} \]
Required value of \( d \) is the larger. \( d = 109.4 \text{ mm} \)
PROBLEM 3.48

A hole is punched at \( A \) in a plastic sheet by applying a 600-N force \( P \) to end \( D \) of lever \( CD \), which is rigidly attached to the solid cylindrical shaft \( BC \). Design specifications require that the displacement of \( D \) should not exceed 15 mm from the time the punch first touches the plastic sheet to the time it actually penetrates it. Determine the required diameter of shaft \( BC \) if the shaft is made of a steel with \( G = 77 \text{ GPa} \) and \( \tau_{\text{all}} = 80 \text{ MPa} \).

SOLUTION

Torque

\[ T = rP = (0.300 \text{ m})(600 \text{ N}) = 180 \text{ N} \cdot \text{ m} \]

Shaft diameter based on displacement limit.

\[ \phi = \frac{\delta}{r} = \frac{15 \text{ mm}}{300 \text{ mm}} = 0.005 \text{ rad} \]

\[ \phi = \frac{TL}{GJ} = \frac{2TL}{\pi Gc^4} \]

\[ c^4 = \frac{2TL}{\pi G\phi} = \frac{(2)(180)(0.500)}{\pi(77 \times 10^9)(0.05)} = 14.882 \times 10^{-9} \text{ m}^4 \]

\[ c = 11.045 \times 10^{-3} \text{ m} = 11.045 \text{ m} \]

\[ d = 2c = 22.1 \text{ mm} \]

Shaft diameter based on stress.

\[ \tau = 80 \times 10^6 \text{ Pa} \]

\[ \tau = \frac{Tc}{J} = \frac{2T}{\pi c^3} \]

\[ c^3 = \frac{2T}{\pi \tau} = \frac{(2)(180)}{\pi(80 \times 10^6)} = 1.43239 \times 10^{-6} \text{ m}^3 \]

\[ c = 11.273 \times 10^{-3} \text{ m} = 11.273 \text{ mm} \]

\[ d = 2c = 22.5 \text{ mm} \]

Use the larger value to meet both limits.

\[ d = 22.5 \text{ mm} \]

Determine the required diameter of the shafts if both shafts are made of a steel with \( G = 11.2 \times 10^6 \) psi and \( \tau_{\text{all}} = 12 \) ksi.

### SOLUTION

**Statics:**

**Gear B.**

\]

**Gear C.**

\[
\sum M_C = 0: \quad r_C F - T_D = 0 \quad T_D = \frac{r_C}{r_B} T_A = nT_B

\[
n = \frac{r_C}{r_B} = \frac{5}{2} = 2.5
\]

**Torques in shafts.**

\[
T_{AB} = T_A = T_B \quad T_{CD} = T_C = nT_B = nT_A

\]

**Kinematics:**

\[
\varphi_D = 0 \quad \varphi_C = \varphi_D + \varphi_{C/D} = 0 + \frac{nT_A L}{GJ}
\]

\[
r_B \varphi_B = -r_C \varphi_B \quad \varphi_B = -\frac{r_C}{r_B} \varphi_C = -n \varphi_C \quad \varphi_B = \frac{n^2 T_A L}{GJ}
\]

\[
\varphi_A = \varphi_C + \varphi_{B/C} = \frac{n^2 T_A L}{GJ} + \frac{T_A L}{GJ} = \frac{(n^2 + 1)T_A L}{GJ}

PROBLEM 3.51

A torque of magnitude $T = 4 \text{kN} \cdot \text{m}$ is applied at end $A$ of the composite shaft shown. Knowing that the modulus of rigidity is 77 GPa for the steel and 27 GPa for the aluminum, determine (a) the maximum shearing stress in the steel core, (b) the maximum shearing stress in the aluminum jacket, (c) the angle of twist at $A$.

SOLUTION

Steel core:

$c_1 = \frac{1}{2} d_1 = 0.027 \text{ m} \quad J_1 = \frac{\pi}{2} c_1^4 = \frac{\pi}{2} (0.027)^4 = 834.79 \times 10^{-9}\text{ m}^4$

$G_1J_1 = (77 \times 10^9)(834.79 \times 10^{-9}) = 64.28 \times 10^3 \text{ N} \cdot \text{m}^2$

Torque carried by steel core. $T_1 = G_1J_1 \phi/L$

Aluminum jacket:

$c_1 = \frac{1}{2} d_1 = 0.027 \text{ m}, \quad c_2 = \frac{1}{2} d_2 = 0.036 \text{ m}$

$J_2 = \frac{\pi}{2} (c_2^4 - c_1^4) = \frac{\pi}{2} (0.036^4 - 0.027^4) = 1.80355 \times 10^{-6} \text{ m}^4$

$G_2J_2 = (27 \times 10^9)(1.80355 \times 10^{-6}) = 48.70 \times 10^3 \text{ N} \cdot \text{m}^2$

Torque carried by aluminum jacket. $T_2 = G_2J_2 \phi/L$

Total torque: $T = T_1 + T_2 = (G_1J_1 + G_2J_2) \phi/L$

$\frac{\phi}{L} = \frac{T}{G_1J_1 + G_2J_2} = \frac{4 \times 10^3}{64.28 \times 10^3 + 48.70 \times 10^3} = 35.406 \times 10^{-3} \text{ rad/m}$

(a) Maximum shearing stress in steel core.

$\tau = G_1c_1 \frac{\phi}{L} = (77 \times 10^9)(0.027)(35.406 \times 10^{-3}) = 73.6 \times 10^6 \text{ Pa} \quad 73.6 \text{ MPa} \blacktriangleleft$

(b) Maximum shearing stress in aluminum jacket.

$\tau = G_2c_2 \frac{\phi}{L} = (27 \times 10^9)(0.036)(35.406 \times 10^{-3}) = 34.4 \times 10^6 \text{ Pa} \quad 34.4 \text{ MPa} \blacktriangleleft$

(c) Angle of twist.

$\phi = \frac{L \phi}{L} = (2.5)(35.406 \times 10^{-3}) = 88.5 \times 10^{-3} \text{ rad} \quad \phi = 5.07^\circ \blacktriangleleft$
**PROBLEM 3.52**

The composite shaft shown is to be twisted by applying a torque $T$ at end $A$. Knowing that the modulus of rigidity is 77 GPa for the steel and 27 GPa for the aluminum, determine the largest angle through which end $A$ can be rotated if the following allowable stresses are not to be exceeded: $\tau_{\text{steel}} = 60 \text{ MPa}$ and $\tau_{\text{aluminum}} = 45 \text{ MPa}$.

**SOLUTION**

$$\tau_{\max} = G\gamma_{\max} = Gc_{\max} \frac{\varphi}{L}$$

$$\varphi_{\max} = \frac{\tau_{\max}}{Gc_{\max}} \quad \text{for each material.}$$

**Steel core:**

$$\tau_{\text{all}} = 60 \times 10^6 \text{ Pa}, \quad c_{\text{max}} = \frac{1}{2} d = 0.027 \text{ m}, \quad G = 77 \times 10^9 \text{ Pa}$$

$$\varphi_{\text{all}} = \frac{60 \times 10^6}{(77 \times 10^9)(0.027)} = 28.860 \times 10^{-3} \text{ rad/m}$$

**Aluminum Jacket:**

$$\tau_{\text{all}} = 45 \times 10^6 \text{ Pa}, \quad c_{\text{max}} = \frac{1}{2} d = 0.036 \text{ m}, \quad G = 27 \times 10^9 \text{ Pa}$$

$$\varphi_{\text{all}} = \frac{45 \times 10^6}{(27 \times 10^9)(0.036)} = 46.296 \times 10^{-3} \text{ rad/m}$$

Smaller value governs:

$$\frac{\varphi_{\text{all}}}{L} = 28.860 \times 10^{-3} \text{ rad/m}$$

**Allowable angle of twist:**

$$\varphi_{\text{all}} = L \frac{\varphi_{\text{all}}}{L} = (2.5)(28.860 \times 10^{-3}) = 72.15 \times 10^{-3} \text{ rad} \quad \varphi_{\text{all}} = 4.13^\circ$$

Matching expressions for \( \phi_B \)

Two solid steel shafts are fitted with flanges that are then connected by bolts as shown. The bolts are slightly undersized and permit a $1.5^\circ$ rotation of one flange with respect to the other before the flanges begin to rotate as a single unit. Knowing that $G = 11.2 \times 10^6$ psi, determine the maximum shearing stress in each shaft when a torque of $T$ of magnitude $420$ kip $\cdot$ ft is applied to the flange indicated.

PROBLEM 3.55 The torque $T$ is applied to flange $B$.

SOLUTION

Shaft $AB$:

$$T = T_{AB}, \quad L_{AB} = 2 \text{ ft} = 24 \text{ in.}, \quad c = \frac{1}{2}d = 0.625 \text{ in.}$$

$$J_{AB} = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.625)^4 = 0.23968 \text{ in}^4$$

$$\varphi_B = \frac{T_{AB}L_{AB}}{GJ_{AB}}$$

$$T_{AB} = \frac{GJ_{AB}\varphi_B}{L_{AB}} \left(11.2 \times 10^6\right)(0.23968) \varphi_B$$

$$= 111.853 \times 10^3 \varphi_B$$

Shaft $CD$:

Applied torque: $T = 420$ kip $\cdot$ ft $= 5040$ lb $\cdot$ in

$$T = T_{CD}, \quad L_{CD} = 3 \text{ ft} = 36 \text{ in.}, \quad c = \frac{1}{2}d = 0.75 \text{ in.}$$

$$J_{CD} = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.75)^4 = 0.49701 \text{ in}^4$$

$$\varphi_C = \frac{T_{CD}L_{CD}}{GJ_{CD}}$$

$$T_{CD} = \frac{GJ_{CD}\varphi_C}{L_{CD}} \left(11.2 \times 10^6\right)(0.49701) \varphi_C$$

PROBLEM 3.55 (Continued)

Clearance rotation for flange $B$: \[ \phi_B' = 1.5^\circ = 26.18 \times 10^{-3} \text{ rad} \]

Torque to remove clearance: \[ T_{AB}' = (111.853 \times 10^3)(26.18 \times 10^{-3}) = 2928.3 \text{ lb \cdot in} \]

Torque $T''$ to cause additional rotation $\phi''$: \[ T'' = 5040 - 2928.3 = 2111.7 \text{ lb \cdot in} \]

\[ T'' = T_{AB}'' + T_{CD}'' \]

\[ 2111.7 = (111.853 \times 10^3)\phi'' + (154.625 \times 10^3)\phi'' \quad \therefore \quad \phi'' = 7.923 \times 10^{-3} \text{ rad} \]

\[ T_{AB}'' = (111.853 \times 10^3)(7.923 \times 10^{-3}) = 886.21 \text{ lb \cdot in} \]

\[ T_{CD}'' = (154.625 \times 10^3)(7.923 \times 10^{-3}) = 1225.09 \text{ lb \cdot in} \]

Maximum shearing stress in $AB$.

\[ \tau_{AB} = \frac{T_{AB}C}{J_{AB}} = \frac{(2928.3 + 886.21)(0.625)}{0.23968} = 9950 \text{ psi} \quad \tau_{AB} = 9.95 \text{ ksi} \]

Maximum shearing stress in $CD$.

\[ \tau_{CD} = \frac{T_{CD}C}{J_{CD}} = \frac{(1225.09)(0.75)}{0.49701} = 1849 \text{ psi} \quad \tau_{CD} = 1.849 \text{ ksi} \]
PROBLEM 3.56

Two solid steel shafts are fitted with flanges that are then connected by bolts as shown. The bolts are slightly undersized and permit a 1.5° rotation of one flange with respect to the other before the flanges begin to rotate as a single unit. Knowing that \( G = 11.2 \times 10^6 \) psi, determine the maximum shearing stress in each shaft when a torque of \( T \) of magnitude 420 kip \( \cdot \) ft is applied to the flange indicated.

PROBLEM 3.56 The torque \( T \) is applied to flange C.

SOLUTION

Shaft \( AB \):

\[
T = T_{AB}, \quad L_{AB} = 2 \text{ ft} = 24 \text{ in}, \quad c = \frac{1}{2} \quad d = 0.625 \text{ in}.
\]

\[
J_{AB} = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.625)^4 = 0.23968 \text{ in}^4
\]

\[
\phi_B = \frac{T_{AB} L_{AB}}{G J_{AB}}
\]

\[
T_{AB} = \frac{G J_{AB} \phi_B}{L_{AB}} - \frac{11.2 \times 10^6}{(0.23968)} \frac{(0.23968)}{24} \phi_B
\]

\[
= 111.853 \times 10^3 \phi_B
\]

Shaft \( CD \):

Applied torque: \( T = 420 \text{ kip} \cdot \text{ft} = 5040 \text{ lb} \cdot \text{in} \)

\[
T = T_{CD}, \quad L_{CD} = 3 \text{ ft} = 36 \text{ in}, \quad c = \frac{1}{2} \quad d = 0.75 \text{ in}.
\]

\[
J_{CD} = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.75)^4 = 0.49701 \text{ in}^4
\]

\[
\phi_C = \frac{T_{CD} L_{CD}}{G J_{CD}}
\]

\[
T_{CD} = \frac{G J_{CD} \phi_C}{L_{CD}} = \frac{(11.2 \times 10^6)(0.49701)}{36} \phi_C = 154.625 \times 10^3 \phi_C
\]

Clearance rotation for flange C:

\[
\phi_C' = 1.5^\circ = 26.18 \times 10^{-3} \text{ rad}
\]
PROBLEM 3.56  (Continued)

Torque to remove clearance:  \[ T'_{CD} = (154.625 \times 10^3)(26.18 \times 10^{-3}) = 4048.1 \text{ lb} \cdot \text{in} \]

Torque \( T'' \) to cause additional rotation \( \phi'' \):  \[ T'' = 5040 - 4048.1 = 991.9 \text{ lb} \cdot \text{in} \]

\[ T'' = T''_{AB} + T''_{CD} \]

\[ 991.9 = (111.853 \times 10^3)\phi'' + (154.625 \times 10^3)\phi'' \quad \therefore \phi'' = 3.7223 \times 10^{-3} \text{ rad} \]

\[ T''_{AB} = (111.853 \times 10^{-3})(3.7223 \times 10^{-3}) = 416.35 \text{ lb} \cdot \text{in} \]

\[ T''_{CD} = (154.625 \times 10^{-3})(3.7223 \times 10^{-3}) = 575.56 \text{ lb} \cdot \text{in} \]

Maximum shearing stress in \( AB \).

\[ \tau_{AB} = \frac{T'_{AB}c}{J_{AB}} = \frac{(416.35)(0.625)}{0.23968} = 1086 \text{ psi} \quad \tau_{AB} = 1.086 \text{ ksi} \]

Maximum shearing stress in \( CD \).

\[ \tau_{CD} = \frac{T'_{CD}c}{J_{CD}} = \frac{(4048.1 + 575.56)(0.75)}{0.49701} = 6980 \text{ psi} \quad \tau_{CD} = 6.98 \text{ ksi} \]
PROBLEM 3.57

Ends $A$ and $D$ of two solid steel shafts $AB$ and $CD$ are fixed, while ends $B$ and $C$ are connected to gears as shown. Knowing that a 4-kN⋅m torque $T$ is applied to gear $B$, determine the maximum shearing stress ($a$) in shaft $AB$, ($b$) in shaft $CD$.

SOLUTION

Gears $B$ and $C$:

\[ \phi_B = \frac{r_C}{r_B} \phi_C = \frac{40}{100} \phi_C \quad \phi_B = 0.4 \phi_C \quad (1) \]

\[ \sum M_C = 0 : T_{CD} = r_C F \quad (2) \]

\[ \sum M_B = 0 : T - T_{AB} = r_B F \quad (3) \]

Solve (2) for $F$ and substitute into (3):

\[ T - T_{AB} = \frac{r_B}{r_C} T_{CD} \quad T = T_{AB} + \frac{100}{40} T_{CD} \quad (4) \]

\[ T = T_{AB} + 2.5 T_{CD} \]

Shaft $AB$:

\[ L = 0.3 \text{ m}, \quad c = 0.030 \text{ m} \]

\[ \phi_B = \phi_{B/A} = \frac{T_{AB}L}{JG} = \frac{T_{AB} (0.3)}{\frac{\pi}{2} (0.030)^4 6} = 235.79 \times 10^3 \frac{T_{AB}}{G} \quad (5) \]

Shaft $CD$:

\[ L = 0.5 \text{ m}, \quad c = 0.0225 \text{ m} \]

\[ \phi_C = \phi_{C/D} = \frac{T_{CD}L}{JG} = \frac{T_{CD} (0.5)}{\frac{\pi}{2} (0.0225)^4 6} = 1242 \times 10^3 \frac{T_{CD}}{G} \quad (6) \]

Substitute from (5) and (6) into (1):

\[ \phi_B = 0.4\phi_C: \quad 235.79 \times 10^3 \frac{T_{AB}}{G} = 0.4 \times 1242 \times 10^3 \frac{T_{CD}}{G} \]

\[ T_{CD} = 0.4746 = T_{AB} \quad (7) \]
PROBLEM 3.57  (Continued)

Substitute for $T_{CD}$ from (7) into (4):

$$T = T_{AB} + 2.5 (0.47462 T_{AB}) \quad T = 2.1865 T_{AB} \quad (8)$$

For $T = 4$ kN · m, Eq. (8) yields

$$2.1865 T_{AB} = 4000 \text{ N} \cdot \text{m} \quad T_{AB} = 1829.4 \text{ N} \cdot \text{m}$$

Substitute into (7):

$$T_{CD} = 0.47462 (1829.4) = 868.3 \text{ N} \cdot \text{m}$$

(a) Stress in $AB$:

$$\tau_{AB} = \frac{T_{AB}}{J} = \frac{2 T_{AB}}{\pi c^3} = \frac{2 \cdot 1829.4}{\pi (0.030)^3} = 43.1 \times 10^6 \quad \tau_{AB} = 43.1 \text{ MPa}$$

(b) Stress in $CD$:

$$\tau_{CD} = \frac{T_{CD}}{J} = \frac{2 T_{CD}}{\pi c^3} = \frac{2 \cdot 868.3}{\pi (0.0225)^3} = 48.5 \times 10^6 \quad \tau_{CD} = 48.5 \text{ MPa}$$

Ends $A$ and $D$ of the two solid steel shafts $AB$ and $CD$ are fixed, while ends $B$ and $C$ are connected to gears as shown. Knowing that the allowable shearing stress is 50 MPa in each shaft, determine the largest torque $T$ that may be applied to gear $B$.

SOLUTION

Gears $B$ and $C$:

$$\phi_B = \frac{r_C}{r_B} \phi_C = \frac{40}{100} \phi_C \quad \phi_B = 0.4 \phi_C \quad (1)$$

$$\Sigma M_C = 0: \ T_{CD} = r_C F \quad (2)$$

$$\Sigma M_B = 0: \ T - T_{AB} = r_B F \quad (3)$$

$$L = 0.5 \text{ m}, \ c = 0.0225 \text{ m}$$

$$\phi_C = \phi_{C/D} = \frac{T_{CD} L}{JG} = \frac{T_{CD} (0.5)}{\frac{\pi}{2} (0.0225)^4 G} = 1242 \times 10^3 \frac{T_{CD}}{G} \quad (6)$$
PROBLEM 3.58  (Continued)

Substitute from (5) and (6) into (1):

\[
T_{CD} = 0.47462 T_{AB} \quad (7)

Substitute for \(T_{CD}\) from (7) into (4):

\[
T = T_{AB} + 2.5 (0.47462 T_{AB}) \quad T = 2.1865 T_{AB} \quad (8)

Solving (7) for \(T_{AB}\) and substituting into (8),

\[

From (8):

\[
T = 2.1865(2120.6 \text{ N} \cdot \text{m}) = 4.64 \text{ kN} \cdot \text{m}

PROBLEM 3.59

The steel jacket $CD$ has been attached to the 40-mm-diameter steel shaft $AE$ by means of rigid flanges welded to the jacket and to the rod. The outer diameter of the jacket is 80 mm and its wall thickness is 4 mm. If 500 N·m torques are applied as shown, determine the maximum shearing stress in the jacket.

SOLUTION

Solid shaft:

$$c = \frac{1}{2}d = 0.020\text{ m}$$

$$J_S = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.020)^4 = 251.33 \times 10^{-9} \text{ m}^4$$

Jacket:

$$c_2 = \frac{1}{2}d = 0.040\text{ m}$$

$$c_1 = c_2 - t = 0.040 - 0.004 = 0.036\text{ m}$$

$$J_J = \frac{\pi}{2} (c_2^4 - c_1^4) = \frac{\pi}{2} (0.040^4 - 0.036^4)$$

$$= 1.3829 \times 10^{-6} \text{ m}^4$$

Torque carried by shaft.

$$T_S = GJ_S \varphi/L$$

Torque carried by jacket.

$$T_J = GJ_J \varphi/L$$

Total torque. $$T = T_S + T_J = (J_S + J_J) G \varphi/L$$

$$\therefore \frac{G \varphi}{L} = \frac{T}{J_S + J_J}$$

$$T_J = \frac{J_J}{J_S + J_J} T = \frac{(1.3829 \times 10^{-6})(500)}{1.3829 \times 10^{-6} + 251.33 \times 10^{-6}} = 423.1 \text{ N} \cdot \text{m}$$

Maximum shearing stress in jacket.

$$\tau = \frac{T_J c_2^2}{J_J} = \frac{(423.1)(0.040)}{1.3829 \times 10^{-6}} = 12.24 \times 10^6 \text{ Pa}$$

A solid shaft and a hollow shaft are made of the same material and are of the same weight and length. Denoting by \( n \) the ratio \( \frac{c_1}{c_2} \), show that the ratio \( \frac{T_s}{T_h} \) of the torque \( T_s \) in the solid shaft to the torque \( T_h \) in the hollow shaft is

\[(a) \sqrt{(1-n^2)/(1+n^2)} \] if the maximum shearing stress is the same in each shaft, \((b) (1-n)/(1+n^2)\) if the angle of twist is the same for each shaft.

**SOLUTION**

For equal weight and length, the areas are equal.

\[
\pi c_0^2 = \pi \left(c_1^2 - c_2^2\right) = \pi c_2^2(1-n^2) \quad \therefore \quad c_0 = c_2(1-n^2)^{1/2}

\[

\]

\(a)\) For equal stresses.

\[
\tau = \frac{T_s}{J_s} = \frac{T_h}{J_h}
\]

\[
\frac{T_s}{J_s} = \frac{J_s c_2}{J_h c_0} = \frac{\frac{\pi}{2} c_2^4(1-n^2)^2 c_2}{\frac{\pi}{2} c_2^4(1-n^4) c_2(1-n^2)^{1/2}} = \frac{1-n^2}{(1+n^2)(1-n^2)^{1/2}} = \frac{(1-n^2)^{1/2}}{1+n^2}
\]

\(b)\) For equal angles of twist.

\[
\varphi = \frac{T_s L}{G J_s} = \frac{T_h L}{G J_h}
\]

\[
\frac{T_s}{T_h} = \frac{J_h}{J_s} = \frac{\frac{\pi}{2} c_2^4(1-n^2)^2}{\frac{\pi}{2} c_2^4(1-n^4)} = \frac{(1-n^2)^2}{1-n^4} = \frac{1-n^2}{1+n^2}

Twist in length $dy$:

SOLUTION

Torsion spring constant $K = 4.27 \text{ lb} \cdot \text{ft/rad} = 51.24 \text{ lb} \cdot \text{in/rad}$

$$K = \frac{T}{\varphi} = \frac{T}{L} = \frac{GJ}{L} = \frac{\pi Gc^4}{2L}$$

\[
f = \frac{1200}{60} = 20 \text{ Hz} \quad T = \frac{P}{2\pi f} = \frac{660 \times 10^3}{2\pi(20)} = 5.2521 \times 10^3 \text{ lb} \cdot \text{in}
\]

\[
\tau = \frac{Tc}{J} = \frac{2T}{\pi c^3} \quad \therefore \quad c^3 = \frac{2T}{\pi \tau} = \frac{(2)(5.2521 \times 10^3)}{\pi(7500)} = 0.4458 \text{ in}^3

PROBLEM 3.68

Determine the required thickness of the 50-mm tubular shaft of Example 3.07 if it is to transmit the same power while rotating at a frequency of 30 Hz.

SOLUTION

From Example 3.07, \( P = 100 \text{kW} = 100 \times 10^3 \text{ W} \)

\( \tau_{\text{all}} = 60 \text{ MPa} = 60 \times 10^6 \text{ Pa} \quad c_2 = \frac{1}{2} \quad d = 25 \text{ mm} = 0.025 \text{ m} \)

\( f = 30 \text{ Hz} \)

\( T = \frac{P}{2\pi f} = 530.52 \text{ N} \cdot \text{m} \)

\( J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) \quad \tau = \frac{T c_2}{J} = \frac{2 T c_2}{\pi \left( c_2^4 - c_1^4 \right)} \)

\( c_1^4 = c_2^4 - \frac{2 T c_2}{\pi \tau} = 0.025^4 - \frac{2 \times 530.52 \times 0.025}{\pi \times 60 \times 10^6} = 249.90 \times 10^{-9} \text{ m}^4 \)

\( c_1 = 22.358 \times 10^{-3} \text{ m} = 22.358 \text{ mm} \)

\( t = c_2 - c_1 = 25 \text{ mm} - 22.358 \text{ mm} = 2642 \text{ mm} \quad t = 2.64 \text{ mm} \)
PROBLEM 3.69

While a steel shaft of the cross section shown rotates at 120 rpm, a stroboscopic measurement indicates that the angle of twist is 2° in a 12-ft length. Using $G = 11.2 \times 10^6$ psi, determine the power being transmitted.

SOLUTION

\[ \varphi = 2^\circ = 34.907 \times 10^{-3} \text{ rad} \quad L = 12 \text{ ft} = 144 \text{ in.} \]

\[ c_2 = \frac{1}{2} d_o = 1.5 \text{ in.} \quad c_1 = \frac{1}{2} d_i = 0.6 \text{ in.} \]

\[ J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} (1.5^4 - 0.6^4) = 7.7486 \text{ in}^4 \]

\[ f = \frac{120}{60} = 2 \text{ Hz} \]

\[ T = \frac{GJ\varphi}{L} = \frac{(11.2 \times 10^6)(7.7486)(34.907 \times 10^{-3})}{144} = 21.037 \times 10^3 \text{ lb} \cdot \text{in} \]

\[ P = 2\pi fT = 2\pi (2)(21.037 \times 10^3) = 264.36 \times 10^3 \text{ lb} \cdot \text{in/s} \]

Since 1 hp = 6600 lb \cdot in/s, \[ P = 40.1 \text{ hp} \]
PROBLEM 3.70

The hollow steel shaft shown \((G = 77.2 \text{ GPa}, \tau_{\text{all}} = 50 \text{ MPa})\) rotates at 240 rpm. Determine \((a)\) the maximum power that can be transmitted, \((b)\) the corresponding angle of twist of the shaft.

SOLUTION

\[ c_2 = \frac{1}{2} d_2 = 30 \text{ mm} \]
\[ c_1 = \frac{1}{2} d_1 = 12.5 \text{ mm} \]
\[ J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} [(30)^4 - (12.5)^4] \]
\[ = 1.234 \times 10^6 \text{ mm}^4 = 1.234 \times 10^{-6} \text{ m}^4 \]
\[ \tau_m = 50 \times 10^6 \text{ Pa} \]
\[ \tau_m = \frac{T_c}{J} \quad T = \frac{\tau_m J}{c} = \frac{(50 \times 10^6)(1.234 \times 10^{-6})}{30 \times 10^{-3}} = 2056.7 \text{ N} \cdot \text{m} \]

Angular speed. \(f = 240 \text{ rpm} = 4 \text{ rev/sec} = 4 \text{ Hz} \)

\((a)\) Power being transmitted. \[ P = 2\pi f T = 2\pi(4)(2056.7) = 51.7 \times 10^3 \text{ W} \]

\[ P = 51.7 \text{ kW} \]

\((b)\) Angle of twist. \[ \phi = \frac{TL}{GJ} = \frac{(2056.7)(5)}{(77.2 \times 10^9)(1.234 \times 10^{-6})} = 0.1078 \text{ rad} \]

\[ \phi = 6.17^\circ \]
PROBLEM 3.71

As the hollow steel shaft shown rotates at 180 rpm, a stroboscopic measurement indicates that the angle of twist of the shaft is $3^\circ$. Knowing that $G = 77.2$ GPa, determine (a) the power being transmitted, (b) the maximum shearing stress in the shaft.

SOLUTION

\[ c_2 = \frac{1}{2}d_2 = 30 \text{ mm} \]
\[ c_1 = \frac{1}{2}d_1 = 12.5 \text{ mm} \]
\[ J = \frac{\pi}{2}(c_2^4 - c_1^4) = \frac{\pi}{2}((30)^4 - (12.5)^4) \]
\[ = 1.234 \times 10^6 \text{ mm}^4 = 1.234 \times 10^{-6} \text{ m}^4 \]
\[ \phi = 3^\circ = 0.05236 \text{ rad} \]
\[ \phi = \frac{TL}{GJ} \]
\[ T = \frac{GJ\phi}{L} = \frac{(77.2 \times 10^9)(1.234 \times 10^{-6})(0.0536)}{5} = 997.61 \text{ N} \cdot \text{m} \]

Angular speed: $f = 180 \text{ rpm} = 3 \text{ rev/sec} = 3 \text{ Hz}$

(a) Power being transmitted.
\[ P = 2\pi fT = 2\pi(3)(997.61) = 18.80 \times 10^3 \text{ W} \]
\[ P = 18.80 \text{ kW} \]

(b) Maximum shearing stress.
\[ \tau_m = \frac{Tc_2}{J} = \frac{(997.61)(30 \times 10^{-3})}{1.234 \times 10^{-6}} \]
\[ = 24.3 \times 10^6 \text{ Pa} \]
\[ \tau_m = 24.3 \text{ MPa} \]
PROBLEM 3.72

The design of a machine element calls for a 40-mm-outter-diameter shaft to transmit 45 kW. (a) If the speed of rotation is 720 rpm, determine the maximum shearing stress in shaft $a$. (b) If the speed of rotation can be increased 50% to 1080 rpm, determine the largest inner diameter of shaft $b$ for which the maximum shearing stress will be the same in each shaft.

SOLUTION

(a) $f = \frac{720}{60} = 12$ Hz

$P = 45 \text{ kW} = 45 \times 10^3 \text{W}$

$T = \frac{P}{2\pi f} = \frac{45 \times 10^3}{2\pi(12)} = 596.83 \text{ N} \cdot \text{m}$

$c = \frac{d}{2} = 20 \text{ mm} = 0.020 \text{ m}$

$\tau = \frac{Tc}{J} = \frac{2T}{\pi c^3} = \frac{(2)(596.83)}{\pi(0.020)^3} = 47.494 \times 10^6 \text{ Pa}$

$\tau_{\text{max}} = 47.5 \text{ MPa}$

(b) $f = \frac{1080}{60} = 18$ Hz

$T = \frac{45 \times 10^3}{2\pi(18)} = 397.89 \text{ N} \cdot \text{m}$

$\tau = \frac{Tc_2}{J} = \frac{2Tc_2}{\pi\left(c_2^4 - c_1^4\right)}$

$c_1^4 = c_2^4 - \frac{2Tc_2}{\pi\tau}$

$c_1^4 = 0.020^4 - \frac{(2)(397.89)(0.020)}{\pi(47.494 \times 10^6)} = 53.333 \times 10^{-9}$

$c_1 = 15.20 \times 10^{-3} \text{ m} = 15.20 \text{ mm}$

$d_2 = 2c_1 = 30.4 \text{ mm}$
PROBLEM 3.73

A steel pipe of 3.5-in. outer diameter is to be used to transmit a torque of 3000 lb · ft without exceeding an allowable shearing stress of 8 ksi. A series of 3.5-in.-outer-diameter pipes is available for use. Knowing that the wall thickness of the available pipes varies from 0.25 in. to 0.50 in. in 0.0625-in. increments, choose the lightest pipe that can be used.

SOLUTION

\[ T = 3000 \text{ lb} \cdot \text{ft} = 36 \times 10^3 \text{ lb} \cdot \text{in} \]

\[ c_2 = \frac{1}{2} d_o = 1.75 \text{ in.} \]

\[ \tau = \frac{Tc_2}{J} = \frac{2Tc_2}{\pi (c_2^4 - c_1^4)} \]

\[ c_1^4 = c_2^4 - \frac{2Tc_2}{\pi \tau} = 1.75^4 - \frac{(2)(36 \times 10^3)(1.75)}{\pi(8 \times 10^3)} = 4.3655 \text{ in}^4 \]

\[ c_1 = 1.4455 \text{ in.} \]

Required minimum thickness: \( t = c_2 - c_1 \)

Three shafts and four gears are used to form a gear train that will transmit power from the motor at \( A \) to a machine tool at \( F \). (Bearings for the shafts are omitted in the sketch.) The diameter of each shaft is as follows: \( d_{AB} = 16 \text{ mm}, \quad d_{CD} = 20 \text{ mm}, \quad d_{EF} = 28 \text{ mm} \). Knowing that the frequency of the motor is 24 Hz and that the allowable shearing stress for each shaft is 75 MPa, determine the maximum power that can be transmitted.

SOLUTION

\[
\tau_{\text{all}} = 75 \text{ MPa} = 75 \times 10^6 \text{ Pa}
\]

**Shaft AB:**

\[
c_{AB} = \frac{1}{2} d_{AB} = 0.008 \text{ m} \quad \tau = \frac{T_{\text{CA}}}{J_{AB}} = \frac{2T}{\pi c_{AB}^3}
\]

\[
T_{\text{all}} = \frac{\pi}{2} c_{AB}^3 \tau_{\text{all}} = \frac{\pi}{2} (0.008)^3 (75 \times 10^6) = 60.319 \text{ N} \cdot \text{m}
\]

\[
f_{AB} = 24 \text{ Hz} \quad P_{\text{all}} = 2\pi f_{AB} T_{\text{all}} = 2\pi (24)(60.319) = 9.10 \times 10^3 \text{ W}
\]

**Shaft CD:**

\[
c_{CD} = \frac{1}{2} d_{CD} = 0.010 \text{ m}
\]

\[
\tau = \frac{T_{\text{CD}}}{J_{CD}} = \frac{2T}{\pi c_{CD}^3} \quad \therefore \quad T_{\text{all}} = \frac{\pi}{2} c_{CD}^3 \tau_{\text{all}} = \frac{\pi}{2} (0.010)^3 (75 \times 10^6) = 117.81 \text{ N} \cdot \text{m}

\[
f_{CD} = \frac{r_B}{r_C} f_{AB} = \frac{60}{150} (24) = 9.6 \text{ Hz} \quad P_{\text{all}} = 2\pi f_{CD} T_{\text{all}} = 2\pi (9.6)(117.81) = 7.11 \times 10^3 \text{ W}
\]

**Shaft EF:**

\[
c_{EF} = \frac{1}{2} d_{EF} = 0.014 \text{ m}
\]

\[
T_{\text{all}} = \frac{\pi}{2} c_{EF}^3 \tau_{\text{all}} = \frac{\pi}{2} (0.014)^3 (75 \times 10^6) = 323.27 \text{ N} \cdot \text{m}
\]

\[
f_{EF} = \frac{r_D}{r_E} f_{CD} = \frac{60}{150} (9.6) = 3.84 \text{ Hz}
\]

\[
P_{\text{all}} = 2\pi f_{EF} T_{\text{all}} = 2\pi (3.84)(323.27) = 7.80 \times 10^3 \text{ W}

**PROBLEM 3.78**

A 1.5-m-long solid steel of 48 mm diameter is to transmit 36 kW between a motor and a machine tool. Determine the lowest speed at which the shaft can rotate, knowing that \( G = 77.2 \text{ GPa} \), that the maximum shearing stress must not exceed 60 MPa, and the angle of twist must not exceed 2.5°.

**SOLUTION**

\[
P = 36 \times 10^3 \text{ W}, \quad c = \frac{d}{2} = 0.024 \text{ m}, \quad L = 1.5 \text{ m}, \quad G = 77.2 \times 10^9 \text{ Pa}
\]

Torque based on maximum stress: \( \tau = 60 \text{ MPa} = 60 \times 10^6 \text{ Pa} \)

\[
\tau = \frac{Tc}{J} \quad T = \frac{J\tau}{c} = \frac{\pi c^3 \tau}{2} = \frac{\pi}{2} (0.024)^3 (60 \times 10^6) = 1.30288 \times 10^3 \text{ N} \cdot \text{m}
\]

Torque based on twist angle: \( \varphi = 2.5^\circ = 43.633 \times 10^{-3} \text{ rad} \)

\[
\varphi = \frac{TL}{GJ} \quad T = \frac{GJ \varphi}{L} = \frac{\pi c^4 G \varphi}{2L} = \frac{\pi (0.024)^4 (77 \times 10^9)(43.633 \times 10^{-3})}{2(1.5)} = 1.17033 \times 10^3 \text{ N} \cdot \text{m}
\]

Smaller torque governs, so \( T = 1.17033 \times 10^3 \text{ N} \cdot \text{m} \)

\[
P = 2\pi fT \quad f = \frac{P}{2\pi T} = \frac{36 \times 10^3}{2\pi (1.17033 \times 10^3)}
\]

\[f = 4.90 \text{ Hz} \]
PROBLEM 3.79

A 2.5-m-long steel shaft of 30-mm diameter rotates at a frequency of 30 Hz. Determine the maximum power that the shaft can transmit, knowing that \( G = 77.2 \text{ GPa} \), that the allowable shearing stress is 50 MPa, and that the angle of twist must not exceed 7.5°.

SOLUTION

\[
c = \frac{1}{2}d = 15 \text{ mm} = 0.015 \text{ m} \quad L = 2.5 \text{ m}
\]

Stress requirement.

\[
\tau = 50 \times 10^6 \text{ Pa} \quad \tau = \frac{T_c}{J}
\]

\[
T = \frac{\tau J}{c} = \frac{\pi \tau c^3}{2} = \frac{\pi}{2} (50 \times 10^6)(0.015)^3 = 265.07 \text{ N} \cdot \text{m}
\]

Twist angle requirement.

\[
\phi = 7.5^\circ = 130.90 \times 10^{-3} \text{ rad} \quad G = 77.2 \times 10^9 \text{ Pa}
\]

\[
\phi = \frac{T_L}{GJ} = \frac{2T_L}{\pi Gc^4}
\]

\[
T = \frac{\pi}{2} Gc^4 \phi = \frac{\pi}{2} (77.2 \times 10^9)(0.015)^4(130.90 \times 10^{-3}) = 803.60 \text{ N} \cdot \text{m}
\]

Smaller value of \( T \) is the maximum allowable torque.

\[
T = 265.07 \text{ N} \cdot \text{m}
\]

Power transmitted at \( f = 30 \text{ Hz} \).

\[
P = 2\pi f T = 2\pi(30)(265.07) = 49.96 \times 10^3 \text{ W} \quad P = 50.0 \text{ kW}

PROBLEM 3.80

A steel shaft must transmit 210 hp at a speed of 360 rpm. Knowing that \( G = 11.2 \times 10^6 \) psi, design a solid shaft so that the maximum shearing stress will not exceed 12 ksi, and the angle of twist in a 8.2-ft length must not exceed 3°.

SOLUTION

Power:
\[
P = (210 \text{ hp})(6600 \text{ in \cdot lb/s/hp}) = 1.336 \times 10^6 \text{ in \cdot lb/s}
\]

Angular speed:
\[
f = \frac{360 \text{ rpm}}{60 \text{ sec}} = 6 \text{ Hz}

Torque:
\[
T = \frac{P}{2\pi f} = \frac{1.386 \times 10^6}{(2\pi)(6)} = 36.765 \times 10^3 \text{ lb \cdot in}

Stress requirement:
\[
\tau = 12 \text{ ksi}, \quad \tau = \frac{Tc}{Jc} = \frac{2T}{\pi c^3}

Angle of twist requirement:
\[

PROBLEM 3.81

The shaft-disk-belt arrangement shown is used to transmit 3 hp from point A to point D. (a) Using an allowable shearing stress of 9500 psi, determine the required speed of shaft AB. (b) Solve part a, assuming that the diameters of shafts AB and CD are, respectively, 0.75 in. and 0.625 in.

SOLUTION

\[
\tau = 9500 \text{ psi} \quad P = 3 \text{ hp} = (3)(6600) = 19800 \text{ lb} \cdot \text{in/s}
\]

\[
\tau = \frac{T_c}{J} = \frac{2T}{\pi c^3} \quad T = \frac{\pi c^3 \tau}{2}
\]

Allowable torques.

\[
\begin{align*}
\text{5/8 in. diameter shaft:} & \quad c = \frac{5}{16} \text{ in.}, \quad T_{all} = \frac{\pi}{2} \left(\frac{5}{16}\right)^3 (9500) = 455.4 \text{ lb} \cdot \text{in} \\
\text{3/4 in. diameter shaft:} & \quad c = \frac{3}{8} \text{ in.}, \quad T_{all} = \frac{\pi}{2} \left(\frac{3}{8}\right)^3 (9500) = 786.9 \text{ lb} \cdot \text{in}
\end{align*}
\]

Statics:

\[
T_B = r_B(F_1 - F_2) \quad T_C = r_C(F_1 - F_2)
\]

\[
T_B = \frac{r_B}{r_C} T_C = \frac{1.125}{4.5} T_C = 0.25 T_C
\]

(a) Allowable torques.

\[
T_{B,all} = 455.4 \text{ lb} \cdot \text{in} \quad T_{C,all} = 786.9 \text{ lb} \cdot \text{in}
\]

Assume \( T_C = 786.9 \text{ lb} \cdot \text{in} \)

Then \( T_B = (0.25)(786.9) = 196.73 \text{ lb} \cdot \text{in} < 455.4 \text{ lb} \cdot \text{in} \) (okay)

\[
P = 2\pi f_T \quad f_{AB} = \frac{P}{2\pi T_B} = \frac{19800}{2\pi(196.73)} \quad f_{AB} = 16.02 \text{ Hz}
\]

(b) Allowable torques.

\[
T_{B,all} = 786.9 \text{ lb} \cdot \text{in} \quad T_{C,all} = 455.4 \text{ lb} \cdot \text{in}
\]

Assume \( T_C = 455.4 \text{ lb} \cdot \text{in} \)

Then \( T_B = (0.25)(455.4) = 113.85 \text{ lb} \cdot \text{in} < 786.9 \text{ lb} \cdot \text{in} \)

\[
P = 2\pi f_T \quad f_{AB} = \frac{P}{2\pi T_B} = \frac{19800}{2\pi(113.85)} \quad f_{AB} = 27.2 \text{ Hz}

PROBLEM 3.82

A 1.6-m-long tubular steel shaft of 42-mm outer diameter $d_1$ is to be made of a steel for which $\tau_{ult} = 75$ MPa and $G = 77.2$ GPa. Knowing that the angle of twist must not exceed $4^\circ$ when the shaft is subjected to a torque of $900$ N $\cdot$ m, determine the largest inner diameter $d_2$ that can be specified in the design.

SOLUTION

\[
c_1 = \frac{1}{2} d_1 = 0.021 \text{ m} \quad L = 1.6 \text{ m}
\]

Based on stress limit: $\tau = 75$ MPa $= 75 \times 10^6$ Pa

\[
\tau = \frac{Tc_1}{J} \quad \therefore \quad J = \frac{Tc_1}{\tau} = \frac{(900)(0.021)}{75 \times 10^6} = 252 \times 10^{-9} \text{ m}^4
\]

Based on angle of twist limit: $\varphi = 4^\circ = 69.813 \times 10^{-3}$ rad

\[
\varphi = \frac{TL}{GJ} \quad \therefore \quad J = \frac{TL}{G\varphi} = \frac{(900)(1.6)}{(77 \times 10^9)(69.813 \times 10^{-3})} = 267.88 \times 10^{-9} \text{ m}^4
\]

Larger value for $J$ governs. \quad $J = 267.88 \times 10^{-9} \text{ m}^4$

\[
J = \frac{\pi}{2} \left( c_1^4 - c_2^4 \right)
\]

\[
c_2^4 = c_1^4 - \frac{2J}{\pi} = 0.021^4 - \left( \frac{2(267.88 \times 10^{-9})}{\pi} \right) = 23.943 \times 10^{-9} \text{ m}^4
\]

\[
c_2 = 12.44 \times 10^{-3} \text{ m} = 12.44 \text{ mm}
\]

\[
d_2 = 2c_2 = 24.9 \text{ mm}
\]
A 1.6-m-long tubular steel shaft \((G = 77.2 \text{ GPa})\) of 42-mm outer diameter \(d_1\) and 30-mm inner diameter \(d_2\) is to transmit 120 kW between a turbine and a generator. Knowing that the allowable shearing stress is 65 MPa and that the angle of twist must not exceed 3°, determine the minimum frequency at which the shaft can rotate.

**SOLUTION**

\[
c_1 = \frac{1}{2} d_1 = 0.021 \text{ m}, \quad c_2 = \frac{1}{2} d_2 = 0.015 \text{ m}
\]

\[
J = \frac{\pi}{2} (c_1^4 - c_2^4) = \frac{\pi}{2} (0.021^4 - 0.015^4) = 225.97 \times 10^{-9} \text{ m}^4
\]

Based on stress limit: \(\tau = 65 \text{ MPa} = 65 \times 10^6 \text{ Pa}\)

\[
\tau = \frac{Tc_1}{J} \quad \text{or} \quad T = \frac{J\tau}{G} = \frac{(225.97 \times 10^{-9})(65 \times 10^6)}{0.021} = 699.43 \text{ N} \cdot \text{m}
\]

Based on angle of twist limit: \(\phi = 3^\circ = 52.36 \times 10^{-3} \text{ rad}\)

\[
\phi = \frac{TL}{GJ} \quad \text{or} \quad T = \frac{GJ\phi}{L} = \frac{(77 \times 10^9)(225.97 \times 10^{-9})(52.36 \times 10^{-3})}{1.6}
\]

\[
= 569.40 \text{ N} \cdot \text{m}
\]

Smaller torque governs. \(T = 569.40 \text{ N} \cdot \text{m}\)

\[
P = 120 \text{ kW} = 120 \times 10^3 \text{ W}
\]

\[
P = 2\pi fT \quad \text{so} \quad f = \frac{P}{2\pi T} = \frac{120 \times 10^3}{2\pi(569.40)} \quad f = 33.5 \text{ Hz} \downarrow

\[
c = \frac{1}{2} d = 0.75 \text{ in.} \quad T = 2.5 \text{ kip} \cdot \text{in.}

From Fig. 3.32, \( K = 1.33 \)

\[
\tau_{\max} = K \frac{T_c}{J} = (1.33)(3.773) \quad \tau_{\max} = 5.02 \text{ ksi} \quad \uparrow
PROBLEM 3.85

**SOLUTION**

\[
D = 2 \text{ in.} \quad d = 1.5 \text{ in.} \quad \frac{D}{d} = 1.33

\[
c = \frac{1}{2}d = 0.75 \text{ in.} \quad \tau_{\text{max}} = 8 \text{ ksi}

\[
\tau_{\text{max}} = \frac{K T c}{J} \quad \text{or} \quad T = \frac{J \tau_{\text{max}}}{K c} = \frac{\pi \tau_{\text{max}} c^3}{2K}
\]

(a) \( r = \frac{3}{16} \text{ in.} \quad r = 0.1875 \text{ in.} \)
\[
\frac{r}{d} = \frac{0.1875}{1.5} = 0.125

From Fig. 3.32, \( K = 1.33 \)
\[
T = \frac{\pi(8)(0.75)^3}{(2)(1.33)} \quad \text{T = 3.99 kip \cdot in} \]

(b) \( r = \frac{1}{4} \text{ in.} \quad r = 0.25 \text{ in.} \)
\[
\frac{r}{d} = \frac{0.25}{1.5} = 0.1667

From Fig. 3.32, \( K = 1.27 \)
\[

PROBLEM 3.86

The stepped shaft shown must transmit 40 kW at a speed of 720 rpm. Determine the minimum radius \( r \) of the fillet if an allowable stress of 36 MPa is not to be exceeded.

SOLUTION

Angular speed: \( f = (720 \text{ rpm}) \left( \frac{1 \text{ Hz}}{60 \text{ rpm}} \right) = 12 \text{ Hz} \)

Power: \( P = 40 \times 10^3 \text{ W} \)

Torque: \( T = \frac{P}{2\pi f} = \frac{40 \times 10^3}{2\pi(12)} = 530.52 \text{ N \cdot m} \)

In the smaller shaft, \( d = 45 \text{ mm}, \ c = 22.5 \text{ mm} = 0.0225 \text{ m} \)

\[
\tau = \frac{T_c}{J} = \frac{2T}{\pi c^3} = \frac{(2)(530.52)}{\pi(0.0225)^3} = 29.65 \times 10^6 \text{ Pa}
\]

Using \( \tau_{\text{max}} = 36 \text{ MPa} = 36 \times 10^6 \text{ Pa} \) results in

\[
K = \frac{\tau_{\text{max}}}{\tau} = \frac{36 \times 10^6}{29.65 \times 10^6} = 1.214
\]

From Fig 3.32 with \( \frac{D}{d} = \frac{90 \text{ mm}}{45 \text{ mm}} = 2 \), \( \frac{r}{d} = 0.24 \)

\[
r = 0.24d = (0.24)(45 \text{ mm}) = 10.8 \text{ mm}
\]
PROBLEM 3.87

The stepped shaft shown must transmit 45 kW. Knowing that the allowable shearing stress in the shaft is 40 MPa and that the radius of the fillet is \( r = 6 \) mm, determine the smallest permissible speed of the shaft.

SOLUTION

\[
\frac{r}{d} = \frac{6}{30} = 0.2
\]

\[
\frac{D}{d} = \frac{60}{30} = 2

From Fig. 3.32, \( K = 1.26 \)

For smaller side,

\[
c = \frac{1}{2}d = 15 \text{ mm} = 0.015 \text{ m}
\]

\[
\tau = \frac{Kc^2t}{2K} = \frac{2KT}{\pi c^3}
\]

\[
T = \frac{\pi c^3\tau}{2K} = \frac{\pi(0.015)^3(40 \times 10^6)}{(2)(1.26)} = 168.30 \text{ N} \cdot \text{m}
\]

\[
P = 45 \text{ kW} = 45 \times 10^3 \quad P = 2\pi fT

\[
f = \frac{P}{2\pi T} = \frac{45 \times 10^3}{2\pi(168.30 \times 10^3)} = 42.6 \text{ Hz}

\[f = 42.6 \text{ Hz} \square\]
PROBLEM 3.88

The stepped shaft shown must rotate at a frequency of 50 Hz. Knowing that the radius of the fillet is \( r = 8 \text{ mm} \) and the allowable shearing stress is 45 MPa, determine the maximum power that can be transmitted.

SOLUTION

\[
\tau = \frac{KTC}{J} = \frac{2KT}{\pi c^3} \quad T = \frac{\pi c^3 \tau}{2K}
\]

\[
d = 30 \text{ mm} \quad c = \frac{1}{2}d = 15 \text{ mm} = 15 \times 10^{-3} \text{ m}
\]

\[
D = 60 \text{ mm}, \quad r = 8 \text{ mm}
\]

\[
\frac{D}{d} = \frac{60}{30} = 2, \quad \frac{r}{d} = \frac{8}{30} = 0.2667

From Fig. 3.32,

\[

Allowable torque.

\[
T = \frac{\pi(15 \times 10^{-3})^3(45 \times 10^6)}{(2)(1.18)} = 202.17 \text{ N} \cdot \text{m}

Maximum power.

\[
P = 2\pi f T = (2\pi)(50)(202.17) = 63.5 \times 10^3 \text{ W} \quad P = 63.5 \text{ kW}

\[
\tau = \frac{KTc}{J} \quad T = \frac{J\tau}{Kc} = \frac{\pi c^3 \tau}{2K}

\[
f = 2400 \text{ rpm} = 40 \text{ Hz}

SOLUTION

![Diagram showing the rod with elastic core and yield stress $	au_y = 3.5$ MPa]

$\tau_y = 3.5 \times 10^6$ Pa, \( c = \frac{1}{2} \) (30 mm) = 15 mm = 0.015 m

$\rho_y = \frac{1}{2} \) (25 mm) = 12.5 mm = 0.0125 m

$T_y = \frac{J}{c} \tau_y = \frac{\pi}{2} c^3 \tau_y = \frac{\pi}{2} (0.015)^3 (3.5 \times 10^6) = 18.555 \text{ N} \cdot \text{m}$

$T = \frac{4}{3} T_y \left[ 1 - \left( \frac{\rho_y^3}{c^3} \right) \right] = \frac{4}{3} (18.555) \left[ 1 - \left( \frac{0.0125^3}{0.015^3} \right) \right]

**SOLUTION**

\( \tau_y = 21 \text{ ksi} \)

\[

\( T_y = 111.3 \text{ kip \cdot in} \)

(a) For \( t = 0.8 \text{ in.} \quad \rho_y = 1.5 - 0.8 = 0.7 \text{ in.} \)

Eq. (3.32)

\[
T = \frac{4}{3} T_y \left[ 1 - \frac{1}{4} \frac{\rho_y^3}{c^3} \right] = \frac{4}{3} (111.3 \text{ kip \cdot in}) \left[ 1 - \frac{1}{4} \left( \frac{0.7 \text{ in.}}{1.5 \text{ in.}} \right)^3 \right]

SOLUTION

\[ c = 32 \text{ mm} = 0.032 \text{ m} \]
\[ \tau_y = 145 \times 10^6 \text{ Pa} \]
\[ T_y = \frac{J \tau_y}{c} = \frac{\pi}{2} c^3 \tau_y = \frac{\pi}{2} (0.032)^3 (145 \times 10^6) = 7.4634 \times 10^3 \text{ N} \cdot \text{m} \]

(a) $t_p = 16$ mm = 0.016 m
\[
\rho_y = c - t_p = 0.032 - 0.016 = 0.016 \text{ m}
\]
\[
T = \frac{4}{3} T_y \left(1 - \frac{1}{4} \frac{\rho_y^3}{c^3}\right) = \frac{4}{3} (7.4634 \times 10^3) \left(1 - \frac{1}{4} \frac{0.016^3}{0.032^3}\right)

\[ = 9.6402 \times 10^3 \text{ N} \cdot \text{m} \]
\[ T = 9.64 \text{ kN} \cdot \text{m} \]

(b) $t_p = 24$ mm = 0.024 m
\[

**PROBLEM 3.95**

The solid shaft shown is made of a mild steel that is assumed to be elastoplastic with $G = 11.2 \times 10^6$ psi and $\tau_y = 21$ ksi. Determine the maximum shearing stress and the radius of the elastic core caused by the application of torque of magnitude (a) $T = 100$ kip · in., (b) $T = 140$ kip · in.

**SOLUTION**

$c = 1.5$ in., $J = \frac{\pi}{2} c^4 = 7.9522$ in$^4$, $\tau_y = 21$ ksi

(a) $T = 100$ kip · in

$$\tau_m = \frac{Tc}{J} = \frac{(100 \text{ kip} \cdot \text{in})(1.5 \text{ in.})}{7.9522 \text{ in}^4} \quad \tau_m = 18.86$ ksi

Since $\tau_m < \tau_y$, shaft remains elastic.

Radius of elastic core: $c = 1.500$ in.

(b) $T = 140$ kip · in

$$\tau_m = \frac{(140)(1.5)}{7.9522} = 26.4$ ksi. Impossible: $\tau_m = \tau_y = 21$ ksi

Plastic zone has developed. Torque at onset of yield is $T_y = \frac{J}{c} \tau_y = \frac{7.9522}{1.5}(21 \text{ ksi}) = 111.33$ kip · in

Eq. (3.32): $T = \frac{4}{3} T_y \left(1 - \frac{1}{4} \frac{\rho_y}{c^2}\right)$

$$\left(\frac{\rho_y}{c}\right)^3 = 4 - 3 \frac{T}{T_y} = 4 - 3 \frac{140}{111.33} = 0.22743 \quad \frac{\rho_y}{c} = 0.6104$$

$\rho_y = 0.6104c = 0.6104(1.5 \text{ in})$ $\rho_y = 0.916$ in.
PROBLEM 3.96

It is observed that a straightened paper clip can be twisted through several revolutions by the application of a torque of approximately 60 mN \cdot m. Knowing that the diameter of the wire in the paper clip is 0.9 mm, determine the approximate value of the yield stress of the steel.

SOLUTION

\[
\begin{align*}
    c &= \frac{1}{2}d = 0.45 \text{ mm} = 0.45 \times 10^{-3} \text{ m} \\
    T_p &= 60 \text{ mN} \cdot \text{m} = 60 \times 10^{-3} \text{ N} \cdot \text{m} \\
    T_p &= \frac{4}{3} T_y = \frac{4}{3} \frac{J \tau_y}{c} = \frac{4}{3} \frac{\pi}{2} c^3 T_y = \frac{2\pi}{3} c^3 \tau_y \\
    \tau_y &= \frac{3T_p}{2\pi c^3} = \frac{(3)(60 \times 10^{-3})}{2\pi (0.45 \times 10^{-3})^3} = 314 \times 10^6 \text{ Pa} \\

**SOLUTION**

\[
c = \frac{1}{2}d = 15 \text{ mm} \quad T = \frac{4}{3}T_Y \left[ 1 - \left( \frac{\rho_Y}{c} \right)^3 \right]

PROBLEM 3.98

For the solid circular shaft of Prob. 3.95, determine the angle of twist caused by the application of a torque of magnitude (a) \( T = 80 \text{ kip \cdot in.} \), (b) \( T = 130 \text{ kip \cdot in.} \).

SOLUTION

\[
\begin{align*}
c &= \frac{1}{2}d = \frac{1}{2}(3) = 1.5 \text{ in.} & \tau_y &= 21 \times 10^3 \text{ psi} \\
L &= 4 \text{ ft} = 48 \text{ in.} & J &= \frac{\pi}{2}c^4 = \frac{\pi}{2}(1.5)^4 = 7.9522 \text{ in}^4
\end{align*}
\]

Torque at onset of yielding: \( \tau = \frac{T_c}{J} \)

\[
T = \tau J
\]

\[
T_y = \frac{\tau_y J}{c} = \frac{(21 \times 10^3)(7.9522)}{1.5} = 111.330 \times 10^3 \text{ lb \cdot in}
\]

(a) \( T = 80 \text{ kip \cdot in} = 80 \times 10^3 \text{ lb \cdot in} \)

Since \( T < T_y \), the shaft is fully elastic.

\[
\varphi = \frac{TL}{GJ} \quad \Rightarrow \quad \varphi = \frac{(80 \times 10^3)(48)}{(11.2 \times 10^6)(7.9522)} = 43.115 \times 10^{-3} \text{ rad} \quad \Rightarrow \quad \varphi = 2.47^\circ
\]

(b) \( T = 130 \text{ kip \cdot in} = 130 \times 10^3 \text{ lb \cdot in} \quad T > T_y \quad T = \frac{4}{3}T_y \left[ 1 - \left( \frac{\varphi_y}{\varphi} \right)^3 \right]
\]

\[
\varphi_y = \frac{T_y L}{GJ} = \frac{(111.330 \times 10^3)(48)}{(11.2 \times 10^6)(7.9522)} = 60.000 \times 10^{-3} \text{ rad}
\]

\[
\frac{\varphi_y}{\varphi} = \sqrt[3]{4 - 3 \frac{T}{T_y}} = \sqrt[3]{4 - \frac{(3)(130 \times 10^3)}{111.330 \times 10^3}} = 0.79205
\]

\[
\varphi = \frac{\varphi_y}{0.79205} = \frac{60.000 \times 10^{-3}}{0.79205} = 75.75 \times 10^{-3} \text{ rad} \quad \Rightarrow \quad \varphi = 4.34^\circ

The solid shaft shown is made of a mild steel that is assumed to be elastoplastic with $G = 77.2$ GPa and $\tau_y = 145$ MPa. Determine the angle of twist caused by the application of a torque of magnitude (a) $T = 600$ N·m, (b) $T = 1000$ N·m.

SOLUTION

\[ c = \frac{1}{2}d = 15 \text{ mm} = 15 \times 10^{-3} \text{ m} \]

Torque at onset of yielding:

\[ \tau = \frac{T_c}{J} = \frac{2T}{\pi c^3} \]

\[ T_y = \frac{\pi c^3 \tau_y}{2} = \frac{\pi (15 \times 10^{-3})^3 (145 \times 10^6)}{2} = 768.71 \text{ N·m} \]

(a) $T = 600$ N·m. Since $T \leq T_y$, the shaft is elastic.

\[ \phi = \frac{TL}{GJ} = \frac{2TL}{\pi c^4 G} = \frac{(2)(600)(1.2)}{\pi (15 \times 10^{-3})^4 (77.2 \times 10^9)} = 0.11728 \text{ rad} \quad \phi = 6.72^\circ \]

(b) $T = 1000$ N·m. $T > T_y$ A plastic zone has developed.

\[ T = \frac{4}{3} T_y \left[ 1 - \left( \frac{\phi_y}{\phi} \right)^3 \right] \quad \frac{\phi_y}{\phi} = \sqrt[3]{4 - 3 \left( \frac{T}{T_y} \right)} \]

\[ \phi_y \frac{T_L}{GJ} = \frac{2T_L}{\pi c^3 G} = \frac{(2)(768.71)(2.1)}{\pi (15 \times 10^{-3})^4 (77.2 \times 10^9)} = 0.15026 \text{ rad} \]

\[ \phi_y \frac{3}{4} - \frac{(3)(1000)}{768.71} = 0.46003 \]

SOLUTION

\[ L = 3 \text{ ft} = 36 \text{ in.}, \quad c = \frac{1}{2}d = 1.25 \text{ in.}, \quad \tau_y = 21 \times 10^3 \text{ psi} \]

\[ J = \frac{\pi}{2} c^4 = \frac{\pi}{2} (1.25)^4 = 3.835 \text{ in}^4 \]

\[ \tau_y = \frac{T_y c}{J} \quad T_y = J \tau_y = \frac{(3.835)(21 \times 10^3)}{1.25} = 64.427 \times 10^3 \text{ lb} \cdot \text{in} \]

\[ \phi_y = \frac{T_y L}{GJ} = \frac{(64.427 \times 10^3)(36)}{(11.2 \times 10^6)(3.835)} = 53.999 \times 10^{-3} \text{ rad} = 3.0939^\circ \]

(a) \( \phi = 2.5^\circ = 43.633 \times 10^{-3} \text{ rad} \quad \phi < \phi_y \quad \text{The shaft remains elastic.} \]

\[ \phi = \frac{TL}{GJ} \]

\[ T = \frac{GJ\phi}{L} = \frac{(11.2 \times 10^6)(3.835)(43.633 \times 10^{-3})}{36} = 52.059 \times 10^3 \text{ lb} \cdot \text{in} \quad T = 52.1 \text{ kip} \cdot \text{in} \]

(b) \( \phi = 5^\circ = 87.266 \times 10^{-3} \text{ rad} \quad \phi > \phi_y \quad \text{A plastic zone occurs.} \]

Determine the angle of twist caused by the application of a torque of magnitude (a) $T = 600 \text{ N} \cdot \text{m}$, (b) $T = 1000 \text{ N} \cdot \text{m}$.

SOLUTION

\[
c = \frac{1}{2}d = 15 \text{ mm} = 15 \times 10^{-3} \text{ m}
\]

\[
\varphi = 15^\circ = 0.2618 \text{ rad}

\]

(a) Since $\varphi > \varphi_y$, there is a plastic zone.

\[
\tau_y = \frac{T_c}{J} = \frac{2T}{\pi c^3}
\]

\[
T_y = \frac{\pi c^3 \tau_y}{2} = \frac{\pi(15 \times 10^{-3})^3(145 \times 10^6)}{2} = 768.71 \text{ N} \cdot \text{m}
\]

\[
T = \frac{4}{3}T_y \left[1 - \frac{1}{4} \left(\frac{\varphi_y}{\varphi}\right)^3\right] = \frac{4}{3}(768.71) \left[1 - \frac{1}{4} \left(\frac{0.15026}{0.2618}\right)^3\right]

$T = 977 \text{ N} \cdot \text{m}$

(b) $L \gamma_y = \rho_y \varphi = c\varphi_y$

\[
\rho_y = \frac{c\varphi_y}{\varphi} = \frac{(15 \times 10^{-3})(0.15026)}{0.2618} = 8.61 \times 10^{-3} \text{ m}

**SOLUTION**

(a) Radius of elastic core.

\[ c = 0.5\text{ in.} \quad \tau_y = 12 \times 10^3 \text{ psi} \]

\[ T_Y = \frac{J \tau_Y}{c} = \frac{\pi c^3 \tau_Y}{2} = \frac{\pi (0.5)^3 (12 \times 10^3)}{2} = 2356.2 \text{ lb \cdot in} \]

\[ T = 2560 \text{ lb \cdot in} > T_Y \text{ (plastic region with elastic core)} \]

\[ T = \frac{4}{3} T_Y \left(1 - \frac{1}{4} \frac{\rho_Y^3}{c^3}\right) \]

\[ \frac{\rho_Y^3}{c^3} = 4 - \frac{3T}{T_Y} = 4 - \frac{(3)(2560)}{2356.2} = 0.7401 \]

\[ \frac{\rho_Y}{c} = 0.9047 \quad \rho_Y = (0.9047)(0.5) \quad \rho_Y = 0.452\text{ in.} \]

(b) Angle of twist.

\[ \phi_Y = \frac{T_Y}{JG} = \frac{2T_Y L}{\pi c^4 G} = \frac{(2)(2356.2)(76.8)}{\pi (0.5)^4 (4.5 \times 10^6)} = 0.4096 \text{ radians} \]

\[ \phi_Y = \frac{\rho_Y}{c} \quad \phi = \frac{\phi_Y c}{\rho_Y} = \frac{0.4096}{0.9047} = 0.4527 \text{ radians} \]

\( T > T_y \) (plastic region with elastic core) \( \tau_{\text{max}} = \tau_y = 145 \text{MPa} \)

PROBLEM 3.106

The hollow shaft shown is made of a steel that is assumed to be elastoplastic with $\tau_y = 145 \text{ MPa}$ and $G = 77.2 \text{ GPa}$. Determine the magnitude $T$ of the torque and the corresponding angle of twist $(a)$ at the onset of yield, $(b)$ when the plastic zone is 10 mm deep.

SOLUTION

(a) At the onset of yield, the stress distribution is the elastic distribution with $\tau_{\max} = \tau_y$.

$$c_2 = \frac{1}{2}d_2 = 0.030 \text{ m}, \quad c_1 = \frac{1}{2}d_1 = 0.0125 \text{ m}$$

$$J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} (0.030^4 - 0.0125^4) = 1.2340 \times 10^{-6} \text{ m}^4$$

$$\tau_{\max} = \tau_y = \frac{T_y c_2}{J} \quad \therefore \quad T_y = \frac{J \tau_y}{c_2} = \frac{(1.2340 \times 10^{-6})(145 \times 10^6)}{0.030} = 5.9648 \times 10^3 \text{ N} \cdot \text{m}$$

$$T_y = 5.96 \text{ kN} \cdot \text{m} \uparrow$$

$$\phi_y = \frac{T_y L}{GJ} = \frac{(5.9643 \times 10^3)(5)}{(77.2 \times 10^9)(2.234010^{-6})} = 313.04 \times 10^{-3} \text{ rad} \quad \phi_y = 17.94^\circ \uparrow$$

(b) $t = 0.010 \text{ m} \quad \rho_y = c_2 - t = 0.030 - 0.010 = 0.020 \text{ m}$

$$\gamma = \frac{\rho \phi}{L} = \frac{\rho_y \phi_y}{L} = \frac{T_y}{G} \quad \therefore \quad \tau_y = \frac{T_y}{G}$$

$$\varphi = \frac{T_y L}{G \rho_y} = \frac{(145 \times 10^6)(5)}{(77.2 \times 10^9)(0.020)} = 469.56 \times 10^{-3} \text{ rad} \quad \varphi = 26.9^\circ \uparrow$$

Torque $T_1$ carried by elastic portion: $c_1 \leq \rho \leq \rho_y$

$$\tau = \tau_y \text{ at } \rho = \rho_y, \quad \tau_y = \frac{T_y \rho_y}{J_1} \quad \text{where} \quad J_1 = \frac{\pi}{2} \left( \rho_y^4 - c_1^4 \right)$$

$$J_1 = \frac{\pi}{2} (0.020^4 - 0.0125^4) = 212.978 \times 10^{-9} \text{ m}^4$$

$$T_1 = \frac{J_1 \tau_y}{\rho_y} = \frac{(212.978 \times 10^{-9})(145 \times 10^6)}{0.020} = 1.5441 \times 10^3 \text{ N} \cdot \text{m}$$
PROBLEM 3.106 (Continued)

Torque $T_2$ carried by plastic portion:

$$T_2 = 2\pi \int_{\rho_y}^{c_2} \tau_y \rho^2 d\rho = 2\pi \tau_y \frac{c_2^3}{3} - \frac{\rho_y^3}{3} = \frac{2\pi}{3} \tau_y \left( c_2^3 - \rho_y^3 \right)$$

$$= \frac{2\pi}{3} (145 \times 10^6)(0.030^3 - 0.020^3) = 5.7701 \times 10^3 \text{ N} \cdot \text{m}$$

Total torque:

$$T = T_1 + T_2 = 1.5541 \times 10^3 + 5.7701 \times 10^3 = 7.3142 \times 10^3 \text{ N} \cdot \text{m}$$

$$T = 7.31 \text{ kN} \cdot \text{m}$$
**PROBLEM 3.107**

For the shaft of Prob. 3.106, determine (a) angle of twist at which the section first becomes fully plastic, (b) the corresponding magnitude $T$ of the applied torque. Sketch the $T - \phi$ curve for the shaft.

**PROBLEM 3.106** The hollow shaft shown is made of a steel that is assumed to be elastoplastic with $\tau_y = 145$ MPa and $G = 77.2$ GPa. Determine the magnitude $T$ of the torque and the corresponding angle of twist $(a)$ at the onset of yield, $(b)$ when the plastic zone is 10 mm deep.

**SOLUTION**

\[ c_1 = \frac{1}{2}d_1 = 0.0125 \text{ m} \quad c_2 = \frac{1}{2}d_2 = 0.030 \text{ m} \]

(a) For onset of fully plastic yielding, $\rho_Y = c_1$

\[ \tau = \tau_y \quad \therefore \quad \gamma = \frac{\tau_y}{G} = \frac{\rho_Y \phi}{L} = \frac{c_1 \phi}{L} \]

\[ \phi_f = \frac{L \tau_y}{c_1 G} = \frac{(25)(145 \times 10^6)}{(0.0125)(77.2 \times 10^9)} = 751.295 \times 10^{-3} \text{ rad} \quad \phi_f = 43.0^\circ \uparrow \]

(b) $T_p = 2\pi \int_{c_1}^{c_2} \tau_y \rho^2 d\rho = 2\pi \tau_y \frac{\rho^3}{3} \bigg|_{c_1}^{c_2} = 2\pi \tau_y \left( c_2^3 - c_1^3 \right)$

\[ = \frac{2\pi}{3} (145 \times 10^6)(0.030^3 - 0.0125^3) = 7.606 \times 10^3 \text{ N} \cdot \text{m} \quad T_p = 7.61 \text{ kN} \cdot \text{m} \uparrow \]

From Prob. 3.101, $\phi_f = 17.94^\circ \quad T_f = 5.96 \text{ kN} \cdot \text{m}$

Also from Prob. 3.101, $\phi = 26.9^\circ \quad T = 7.31 \text{ kN} \cdot \text{m}$

PROBLEM 3.108

A steel rod is machined to the shape shown to form a tapered solid shaft to which torques of magnitude \( T = 75 \text{ kip} \cdot \text{in.} \) are applied. Assuming the steel to be elastoplastic with \( \tau_Y = 21 \text{ ksi} \) and \( G = 11.2 \times 10^6 \text{ psi} \), determine (a) the radius of the elastic core in portion \( AB \) of the shaft, (b) the length of portion \( CD \) that remains fully elastic.

SOLUTION

(a) In portion \( AB \).
\[
c = \frac{1}{2}d = 1.25 \text{ in.}
\]
\[
T_Y = \frac{J_{AB}\tau_Y}{c} = \frac{\pi}{2}c^3\tau_Y = \frac{\pi}{2}(1.25)^3(21 \times 10^3) = 64.427 \times 10^3 \text{ lb} \cdot \text{in}
\]
\[
T = \frac{4}{3}T_Y \left(1 - \frac{\rho_Y^3}{c^3}\right)
\]
\[
\frac{\rho_Y}{c} = \sqrt[3]{4 - \frac{3T}{T_Y}} = \sqrt[3]{4 - \frac{(3)(75 \times 10^3)}{64.427 \times 10^3}} = 0.79775
\]
\[
\rho_Y = 0.79775c = (0.79775)(1.25) = 0.99718 \text{ in.}
\]
\[
\rho_Y = 0.997 \text{ in.} \quad \blacksquare
\]

(b) For yielding at point \( C \).
\[
\tau = \tau_Y, \quad c = c_x, \quad T = 75 \times 10^3 \text{ lb} \cdot \text{in}
\]
\[
T = \frac{J_{CY}\tau_Y}{c_x} = \frac{\pi}{2}c_x^3\tau_Y
\]
\[
c_x = \sqrt[3]{\frac{2T}{\pi \tau_Y}} = \sqrt[3]{\frac{(2)(75 \times 10^3)}{\pi(21 \times 10^3)}} = 1.31494 \text{ in.}
\]

Using proportions from the sketch,
\[
\frac{1.50 - 1.31494}{1.50 - 1.25} = \frac{x}{5}
\]
\[
x = 3.70 \text{ in.} \quad \blacksquare
\]
PROBLEM 3.109

If the torques applied to the tapered shaft of Prob. 3.108 are slowly increased, determine 
(a) the magnitude $T$ of the largest torques that can be applied to the shaft, 
(b) the length of the portion $CD$ that remains fully elastic.

PROBLEM 3.108 A steel rod is machined to the shape shown to form a tapered solid shaft to which torques of magnitude $T = 75 \text{ kip \cdot in.}$ are applied. Assuming the steel to be elastoplastic with $\tau_y = 21 \text{ ksi}$ and $G = 11.2 \times 10^6 \text{psi}$, determine 
(a) the radius of the elastic core in portion $AB$ of the shaft, 
(b) the length of portion $CD$ that remains fully elastic.

SOLUTION

(a) The largest torque that may be applied is that which makes portion $AB$ fully plastic.

In portion $AB$,

$$c = \frac{1}{2}d = 1.25 \text{ in.}$$

$$T_y = \frac{J_\tau}{c} = \frac{\pi}{2}c^3 \tau_y = \frac{\pi}{2}(1.25)^3(21 \times 10^3) = 64.427 \times 10^3 \text{ lb \cdot in}$$

For fully plastic shaft, $\rho_y = 0$

$$T = \frac{4}{3}T_y \left(1 - \frac{1}{4}\rho_y^3\right) = \frac{4}{3}T$$

$$T = \frac{4}{3}(64.427 \times 10^3) = 85.903 \times 10^3 \text{ lb \cdot in} \quad T = 85.9 \text{ kip \cdot in} \quad \blacktriangleleft$$

(b) For yielding at point $C$, $\tau = \tau_y$, $c = c_x$, $T = 85.9 \times 10^3 \text{ lb \cdot in}$

$$\tau_y = \frac{Te_x}{J_x} = \frac{2T}{\pi c_x^3}$$

$$c_x = \sqrt[3]{\frac{2T}{\pi \tau_y}} = \sqrt[3]{\frac{(2)(85.903 \times 10^3)}{\pi(21 \times 10^3)}} = 1.37580 \text{ in.}$$

Using proportions from the sketch,

$$\frac{1.25}{1.50} = \frac{1.37580}{x} \quad \frac{1.50 - 1.37580}{1.50 - 1.25} = \frac{x}{5}$$

$$x = 2.48 \text{ in.} \quad \blacktriangleleft$$

SOLUTION

\[ \varphi = 10^\circ = 174.53 \times 10^{-3} \text{ rad} \]
\[ c_1 = \frac{1}{2} d_1 = 0.100 \text{ in}, \quad c_2 = \frac{1}{2} d_2 = 0.300 \text{ in.} \]
\[ \gamma_{\text{max}} = \frac{c_2 \varphi}{L} = \frac{(0.300)(174.53 \times 10^{-3})}{9} = 0.00582 \]
\[ \gamma_{\text{min}} = \frac{c_1 \varphi}{L} = \frac{(0.100)(174.53 \times 10^{-3})}{9} = 0.00194 \]

Let
\[ z = \frac{\gamma}{\gamma_{\text{max}}} = \frac{\rho}{c_2}, \quad z_1 = \frac{c_1}{c_2} = \frac{1}{3} \]

where the integral I is given by
\[ I = \int_{1/3}^{1} z^2 \tau \, dz \]

Evaluate I using a method of numerical integration. If Simpson’s rule is used, the integration formula is
\[ I = \frac{\Delta z}{3} \sum w z^2 \tau \]

where w is a weighting factor. Using \( \Delta z = \frac{4}{3} \), we get the values given in the table below.

PROBLEM 3.113

Three points on the nonlinear stress-strain diagram used in Prob. 3.112 are (0,0), (0.0015,55 MPa), and (0.003,80 MPa). By fitting the polynomial $\tau = A + B\gamma + C\gamma^2$ through these points, the following approximate relation has been obtained.

$$T = 46.7 \times 10^9\gamma - 6.67 \times 10^{12}\gamma^2$$

Solve Prob. 3.113 using this relation, Eq. (3.2), and Eq. (3.26).

A 50-mm diameter cylinder is made of a brass for which the stress-strain diagram is as shown. Knowing that the angle of twist is $5^\circ$ in a 725-mm length, determine by approximate means the magnitude $T$ of torque applied to the shaft.

SOLUTION

$$\varphi = 5^\circ = 87.266 \times 10^{-3} \text{ rad}, \quad c = \frac{1}{2}d = 0.025 \text{ m}, \quad L = 0.725 \text{ m}$$

$$\gamma_{\text{max}} = \frac{c\varphi}{L} = \frac{(0.025)(87.266 \times 10^{-3})}{0.725} = 3.009 \times 10^{-3}$$

Let

$$z = \frac{\gamma}{\gamma_{\text{max}}} = \frac{\rho}{c}$$

$$T = 2\pi \int_0^c \rho^2 \tau d\rho = 2\pi c^3 \int_0^1 z^2 \tau dz$$

The given stress-strain curve is

$$\tau = A + B\gamma + C\gamma^2 = A + B\gamma_{\text{max}}z + C\gamma_{\text{max}}^2 z^2$$

$$T = 2\pi c^3 \int_0^1 z^2 \left( A + B\gamma_{\text{max}}z + C\gamma_{\text{max}}^2 z^2 \right) dz$$

$$= 2\pi c^3 \left\{ \frac{1}{3} A + \frac{1}{4} B\gamma_{\text{max}} + \frac{1}{5} C\gamma_{\text{max}}^2 \right\}$$

Data: $A = 0$, $B = 46.7 \times 10^9$, $C = -6.67 \times 10^{12}$

$$\frac{1}{3} A = 0, \quad \frac{1}{4} B\gamma_{\text{max}} = \frac{1}{4} (46.7 \times 10^9)(3.009 \times 10^{-3}) = 35.13 \times 10^3$$

SOLUTION

$$c = 1.2 \text{ in.} \quad L = 35 \text{ ft} = 420 \text{ in.}$$

$$J = \frac{\pi}{2} c^4 = \frac{\pi}{2} (1.2)^4 = 3.2572 \text{ in}^4$$

$$T_y = \frac{J \tau_y}{c} = \frac{(3.2572)(22)}{1.2} = 59.715 \text{ kip} \cdot \text{in}$$

Loading:

$$T = \frac{4}{3} T_y \left(1 - \frac{1}{4} \frac{\rho_y^3}{c^3}\right)$$

$$\frac{\rho_y^3}{c^3} = 4 - \frac{3T}{T_y} = 4 - \frac{(3)(75)}{59.715} = 0.23213$$

$$\rho_y = 0.61458, \quad \rho_y = 0.61458c = 0.73749 \text{ in.}$$

Unloading:

$$\tau' = \frac{T \rho}{J} \quad \text{where} \quad T = 75 \text{ kip} \cdot \text{in}$$

At $\rho = c$

$$\tau' = \frac{(75)(1.2)}{3.2572} = 27.63 \text{ ksi}$$

At $\rho = \rho_y$

$$\tau' = \frac{(75)(0.73749)}{3.2572} = 16.98 \text{ ksi}$$

Residual:

$$\tau_{\text{res}} = \tau_{\text{load}} - \tau'$$

At $\rho = c$

$$\tau_{\text{res}} = 22 - 27.63 = -5.63 \text{ ksi}$$

At $\rho = \rho_y$

$$\tau_{\text{res}} = 22 - 16.98 = 5.02 \text{ ksi}$$

maximum $\tau_{\text{res}} = 5.63 \text{ ksi}$ ▲
PROBLEM 3.115

In Prob. 3.114, determine the permanent angle of twist of the rod.

PROBLEM 3.114

The solid circular drill rod $AB$ is made of steel that is assumed to be elastoplastic with $\tau_y = 22$ ksi and $G = 11.2 \times 10^6$ psi. Knowing that a torque $T = 75$ kip $\cdot$ in. is applied to the rod and then removed, determine the maximum residual shearing stress in the rod.

SOLUTION

From the solution to Prob. 3.114,

$c = 1.2$ in.

$J = 3.2572$ in$^4$

$\frac{\rho_y}{c} = 0.61458$

$\rho_y = 0.73749$ in.

After loading,

$\gamma = \frac{\rho \phi}{L} \therefore \phi = \frac{L \gamma_y}{\rho_y} = \frac{L \tau_y}{\rho_y G}$

$L = 35$ ft $= 420$ in.

$\phi_{load} = \frac{(420)(22 \times 10^3)}{(0.73749)(11.2 \times 10^6)} = 1.11865 \text{ rad} = 64.09^\circ$

During unloading,

$\phi' = \frac{T L}{G J}$ (elastic) $T = 5 \times 10^3$ N $\cdot$ m

$\phi' = \frac{(75 \times 10^3)(420)}{(11.2 \times 10^6)(3.2572)} = 0.86347 \text{ rad} = 49.47^\circ$

Permanent angle of twist.

$\phi_{perm} = \phi_{load} - \phi' = 1.11865 - 0.86347 = 0.25518 \quad \phi = 14.62^\circ \blacktriangleleft$
PROBLEM 3.116

The solid shaft shown is made of a steel that is assumed to be elastoplastic with \( \tau_y = 145 \text{ MPa} \) and \( G = 77.2 \text{ GPa} \). The torque is increased in magnitude until the shaft has been twisted through \( 6^\circ \); the torque is then removed. Determine (a) the magnitude and location of the maximum residual shearing stress, (b) the permanent angle of twist.

SOLUTION

\[ c = 0.016 \text{ m} \quad \phi = 6^\circ = 104.72 \times 10^{-3} \text{ rad} \]

\[ \gamma_{\text{max}} = \frac{c \phi}{L} = \frac{(0.016)(104.72 \times 10^{-3})}{0.6} = 0.0027925 \]

\[ \gamma_y = \frac{\tau_y}{G} = \frac{145 \times 10^6}{77.2 \times 10^9} = 0.0018782 \]

\[ \frac{\rho_y}{c} = \frac{\gamma_y}{\gamma_{\text{max}}} = \frac{0.0018}{0.0027925} = 0.67260 \]

\[ J = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.016)^4 = 102.944 \times 10^{-9} \text{ m}^4 \]

\[ T_y = \frac{J c^3 \tau_y}{c} = \frac{\pi}{2} (0.016)^3 (145 \times 10^6) = 932.93 \text{ N} \cdot \text{m} \]

At end of loading. \[ T_{\text{load}} = \frac{4}{3} T_y \left( 1 - \frac{1}{4} \frac{\rho_y^3}{c^3} \right) = \frac{4}{3} (932.93) \left[ 1 - \frac{1}{4} (0.67433)^3 \right] = 1.14855 \times 10^3 \text{ N} \cdot \text{m} \]

Unloading: elastic \[ T' = 1.14855 \times 10^3 \text{ N} \cdot \text{m} \]

At \( \rho = c \)

\[ \tau' = \frac{T' c}{J} = \frac{(1.14855 \times 10^3)(0.016)}{102.944 \times 10^{-9}} = 178.52 \times 10^6 \text{ Pa} \]

At \( \rho = \rho_y \)

\[ \tau' = \frac{T' c}{J} \frac{\rho_y}{c} = (178.52 \times 10^6)(0.67433) = 120.38 \times 10^6 \text{ Pa} \]

\[ \phi' = \frac{T'L}{GJ} = \frac{(1.14855 \times 10^3)(0.6)}{(77.2 \times 10^9)(102.944 \times 10^{-9})} = 86.71 \times 10^{-3} \text{ rad} = 4.97^\circ \]

Residual:

\[ \tau_{\text{res}} = \tau_{\text{load}} - \tau' \quad \phi_{\text{perm}} = \phi_{\text{lead}} - \phi' \]

(a) At \( \rho = c \)

\[ \tau_{\text{res}} = 145 \times 10^6 - 178.52 \times 10^6 = -33.52 \times 10^6 \text{ Pa} \]

\[ \tau_{\text{res}} = -33.5 \text{ MPa} \]

At \( \rho = \rho_y \)

\[ \tau_{\text{res}} = 145 \times 10^6 - 120.38 \times 10^6 = 24.62 \times 10^6 \text{ Pa} \]

\[ \tau_{\text{res}} = 24.6 \text{ MPa} \]

Maximum residual stress:

33.5 MPa at \( \rho = 16 \text{ mm} \)

(b) \[ \phi_{\text{perm}} = 104.72 \times 10^{-3} - 86.71 \times 10^{-3} = 17.8 \times 10^{-3} \text{ rad} \]

\[ \phi_{\text{perm}} = 1.032^\circ \]
**PROBLEM 3.117**

After the solid shaft of Prob. 3.116 has been loaded and unloaded as described in that problem, a torque $T_1$ of sense opposite to the original torque $T$ is applied to the shaft. Assuming no change in the value of $\phi_Y$, determine the angle of twist $\phi_1$ for which yield is initiated in this second loading and compare it with the angle $\phi_Y$ for which the shaft started to yield in the original loading.

**PROBLEM 3.116** The solid shaft shown is made of a steel that is assumed to be elastoplastic with $\tau_Y = 145 \times 10^6$ MPa and $G = 77.2$ GPa. The torque is increased in magnitude until the shaft has been twisted through $6^\circ$; the torque is then removed. Determine (a) the magnitude and location of the maximum residual shearing stress, (b) the permanent angle of twist.

**SOLUTION**

From the solution to Prob. 3.116,  
\[ c = 0.016 \text{ m}, \quad L = 0.6 \text{ m} \]
\[ \tau_Y = 145 \times 10^6 \text{ Pa}, \]
\[ J = 102.944 \times 10^{-9} \text{ m}^4 \]

The residual stress at $\rho = c$ is \[ \tau_{\text{res}} = 33.5 \text{ MPa} \]

For loading in the opposite sense, the change in stress to produce reversed yielding is  
\[ \tau_1 = \tau_Y - \tau_{\text{res}} = 145 \times 10^6 - 33.5 \times 10^6 = 111.5 \times 10^6 \text{ Pa} \]
\[ \tau_1 = \frac{T_c c}{J} \quad \therefore \quad T_1 = \frac{J \tau_1}{c} = \frac{(102.944 \times 10^{-9})(111.5 \times 10^6)}{0.016} \]
\[ = 717 \text{ N} \cdot \text{m} \]

Angle of twist at yielding under reversed torque.
\[ \phi_1 = \frac{T_1 L}{G J} = \frac{(717 \times 10^3)(0.6)}{(77.2 \times 10^9)(102.944 \times 10^{-9})} = 54.16 \times 10^{-3} \text{ rad} \quad \phi_1 = 3.10^\circ \]

Angle of twist for yielding in original loading.
\[ \gamma = \frac{\tau_Y}{G} = \frac{c \phi_Y}{L} \]
\[ \phi_Y = \frac{L \tau_Y}{c G} = \frac{(0.6)(145 \times 10^6)}{(0.016)(77.2 \times 10^9)} = 70.434 \times 10^{-3} \text{ rad} \quad \phi_Y = 4.04^\circ \]
PROBLEM 3.118

The hollow shaft shown is made of a steel that is assumed to be elastoplastic with \( \tau_y = 145 \text{ MPa} \) and \( G = 77.2 \text{ GPa} \). The magnitude \( T \) of the torques is slowly increased until the plastic zone first reaches the inner surface of the shaft; the torques are then removed. Determine the magnitude and location of the maximum residual shearing stress in the rod.

SOLUTION

When the plastic zone reaches the inner surface, the stress is equal to \( \tau_y \). The corresponding torque is calculated by integration.

\[
\begin{align*}
\int \tau_y' \rho^2 d\rho &= \frac{2\pi}{3} \tau_y (c_2^3 - c_1^3) \\
&= \frac{2\pi}{3} (145 \times 10^6) [(30 \times 10^{-3})^3 - (12.5 \times 10^{-3})^3] \\
&= 7.6064 \times 10^3 \text{ N} \cdot \text{m}
\end{align*}
\]

Unloading

\[
T' = 7.6064 \times 10^3 \text{ N} \cdot \text{m}
\]

\[
\begin{align*}
J &= \frac{\pi}{2} (c_2^4 - c_1^4) \\
&= \frac{\pi}{2} (30^4 - 12.5^4) \\
&= 1.234 \times 10^6 \text{ m}^4
\end{align*}
\]

\[
\begin{align*}
\tau_1' &= \frac{T' c_1}{J} = \frac{(7.6064 \times 10^3)(12.5 \times 10^{-3})}{1.234 \times 10^6} = 77.05 \times 10^6 \text{ Pa} = 77.05 \text{ MPa}
\end{align*}
\]

\[
\begin{align*}
\tau_2' &= \frac{T' c_2}{J} = \frac{(7.6064 \times 10^3)(30 \times 10^{-3})}{1.234 \times 10^6} = 192.63 \times 10^6 \text{ Pa} = 192.63 \text{ MPa}
\end{align*}
\]

Residual stress

Inner surface: \( \tau_{res} = \tau_y - \tau_1' = 145 - 77.05 = 67.95 \text{ MPa} \)

Outer surface: \( \tau_{res} = \tau_y - \tau_2' = 145 - 192.63 = -47.63 \text{ MPa} \)

Maximum residual stress: \( 68.0 \text{ MPa at inner surface} \)
PROBLEM 3.119

In Prob. 3.118, determine the permanent angle of twist of the rod.

PROBLEM 3.118 The hollow shaft shown is made of a steel that is assumed to be elastoplastic with \( \tau_y = 145 \text{ MPa} \) and \( G = 77.2 \text{ GPa} \). The magnitude \( T \) of the torques is slowly increased until the plastic zone first reaches the inner surface of the shaft; the torques are then removed. Determine the magnitude and location of the maximum residual shearing stress in the rod.

SOLUTION

\[
c_1 = \frac{1}{2} d_1 = 12.5 \text{ mm}
\]
\[
c_2 = \frac{1}{2} d_2 = 30 \text{ mm}
\]

When the plastic zone reaches the inner surface, the stress is equal to \( \tau_y \). The corresponding torque is calculated by integration.

\[
dT = \rho \tau \, dA = \rho \tau_y (2\pi \rho d\rho) = 2\pi \rho \, \rho^2 d\rho
\]
\[
T = 2\pi \tau_y \int_{c_1}^{c_2} \rho^2 \, d\rho = \frac{2\pi}{3} \tau_y \left( c_2^3 - c_1^3 \right)
\]
\[
= \frac{2\pi}{3} (145 \times 10^6)((30 \times 10^{-3})^3 - (12.5 \times 10^{-3})^3) = 7.6064 \times 10^3 \text{ N} \cdot \text{m}
\]

Rotation angle at maximum torque.

\[
\frac{c_2 \phi_{\max}}{L} = \gamma_y = \frac{\tau_y}{G}
\]
\[
\phi_{\max} = \frac{\tau_y L}{Gc_1} = \frac{(145 \times 10^6)(5)}{(77.2 \times 10^9)(12.5 \times 10^{-3})} = 0.75130 \text{ rad}
\]

Unloading. \( T' = 7.6064 \times 10^3 \text{ N} \cdot \text{m} \)

\[
J = \frac{\pi}{2} (c_2^4 - c_1^4) = \frac{\pi}{2} [(30)^4 - (12.5)^4] = 1.234 \times 10^6 \text{ mm}^4 = 1.234 \times 10^{-6} \text{ m}^4
\]
\[
\phi' = \frac{T'L}{GJ} = \frac{(7.6064 \times 10^3)(5)}{(77.2 \times 10^9)(1.234 \times 10^{-6})} = 0.39922 \text{ rad}
\]

Permanent angle of twist.

\[
\phi_{\text{perm}} = \phi_{\max} - \phi' = 0.75130 - 0.39922 = 0.35208 \text{ rad}
\]
\[
\phi_{\text{perm}} = 20.2^\circ
\]
PROBLEM 3.120

A torque $T$ applied to a solid rod made of an elastoplastic material is increased until the rod is fully plastic and then removed. (a) Show that the distribution of residual shearing stresses is as represented in the figure. (b) Determine the magnitude of the torque due to the stresses acting on the portion of the rod located within a circle of radius $c_0$.

SOLUTION

(a) After loading:
$$\rho_Y = 0, \quad T_{\text{load}} = \frac{4\pi}{3} T_Y = \frac{4}{3} c^3 \tau_Y = \frac{2\pi}{3} c^3 \tau_Y$$

Unloading:
$$\tau' = \frac{Tc}{J} = \frac{2T}{\pi c^3} = \frac{2(T_{\text{load}})}{\pi c^3} = \frac{4}{3} \tau_Y \quad \text{at} \quad \rho = c$$
$$\tau' = \frac{4}{3} \tau_Y \frac{\rho}{c}$$

Residual:
$$\tau_{\text{res}} = \tau_Y - \frac{4}{3} \tau_Y \frac{\rho}{c} = \tau_Y \left(1 - \frac{4\rho}{3c}\right)$$

To find $c_0$ set, $\tau_{\text{res}} = 0$ and $\rho = c_0$
$$0 = 1 - \frac{4c_0}{3c} \quad \therefore \quad c_0 = \frac{3}{4} c \quad c_0 = 0.150c \quad \blacktriangle$$

(b) \begin{align*}
T_0 &= 2\pi \int_0^{c_0} \rho^2 \tau d\rho = 2\pi \int_0^{(3/4)c} \rho^2 \tau_Y \left(1 - \frac{4\rho}{3c}\right) d\rho \\
&= 2\pi \tau_Y \left[ \frac{\rho^3}{3} - \frac{4}{3} \frac{\rho^4}{4c} \right]_0^{(3/4)c} = 2\pi \tau_Y c^3 \left\{ 1 - \frac{3}{4} \frac{1}{3} \frac{3}{4} - \frac{4}{3} \frac{4}{3} \frac{3}{4} \right\} \\
&= 2\pi \tau_Y c^3 \left\{ \frac{9}{64} - \frac{27}{256} \right\} = \frac{9\pi}{128} \tau_Y c^3 = 0.2209 \tau_Y c^3 \quad T_0 = 0.221\tau_Y c^3 \quad \blacktriangle

Determine the largest allowable square cross section of a steel shaft of length 20 ft if the maximum shearing stress is not to exceed 10 ksi when the shaft is twisted through one complete revolution. Use $G = 11.2 \times 10^6$ psi.

SOLUTION

$L = 20 \text{ ft} = 240 \text{ in.}$

$\tau_{\text{max}} = 10 \text{ ksi} = 10 \times 10^3 \text{ psi}$

$\varphi = 1 \text{ rev} = 2\pi \text{ radians}$

$\tau_{\text{max}} = \frac{T}{c_1ab^2}$  \hspace{1cm} (1)

$\varphi = \frac{TL}{c_2ab^3G}$  \hspace{1cm} (2)

Divide (2) by (1) to eliminate $T$.

$\frac{\varphi}{\tau_{\text{max}}} = \frac{c_1ab^2L}{c_2ab^3G} = \frac{c_1L}{c_2bG}$

Solve for $b$.

$b = \frac{c_1L\tau_{\text{max}}}{c_2G\varphi}$

For a square section,

$\frac{a}{b} = 1.0$

From Table 3.1,

$c_1 = 0.208,$

$c_2 = 0.1406$

$b = \frac{(0.208)(240)(10 \times 10^3)}{(0.1406)(11.2 \times 10^6)(2\pi)}$

$b = 0.0505 \text{ in.}$
PROBLEM 3.126

Determine the largest allowable length of a stainless steel shaft of \( \frac{3}{4} \times \frac{3}{4} \)-in. cross section if the shearing stress is not to exceed 15 ksi when the shaft is twisted through 15°. Use \( G = 11.2 \times 10^6 \) psi.

SOLUTION

\[
\begin{align*}
\tau_{\text{max}} & = \frac{T}{c_1 a b^2} \\
c & = \frac{a}{b} \\
\phi & = \frac{15 \pi}{180} \text{ rad} = 0.26180 \text{ rad} \\
\end{align*}
\]

\[
\begin{align*}
\tau_{\text{max}} & = \frac{T}{c_1 a b^2} \\
\phi & = \frac{TL}{c_2 ab^3 G} \\
\end{align*}
\]

Divide (2) by (1) to eliminate \( T \).

\[
\frac{\phi}{\tau_{\text{max}}} = \frac{c_1 a b^2 L}{c_2 ab^3 G} = \frac{c_1 L}{c_2 b G}

Table 3.1 gives \( c_1 = 0.246, \quad c_2 = 0.229 \)

\[
L = \frac{(0.229)(0.375)(11.2 \times 10^6)(0.26180)}{(0.246)(15 \times 10^3)} = 68.2 \text{ in.} \quad L = 68.2 \text{ in.}

The torque $T$ causes a rotation of $2^\circ$ at end $B$ of the stainless steel bar shown. Knowing that $b = 20$ mm and $G = 75$ GPa, determine the maximum shearing stress in the bar.

SOLUTION

\[ a = 30 \text{ mm} = 0.030 \text{ m} \]
\[ b = 20 \text{ mm} = 0.020 \text{ m} \]

\[ \varphi = 2^\circ = 34.907 \times 10^{-3} \text{ rad} \]

\[ \varphi = \frac{TL}{c_2ab^3G} \quad \therefore \quad T = \frac{c_3ab^3G\varphi}{L} \]

\[ \tau_{\text{max}} = \frac{T}{c_1ab^2} = \frac{c_3ab^3G\varphi}{c_1ab^2L} = \frac{c_3bG\varphi}{c_1L} \]

\[ \frac{a}{b} = \frac{30}{20} = 1.5. \]

From Table 3.1,
\[ c_1 = 0.231 \]
\[ c_2 = 0.1958 \]

\[ \tau_{\text{max}} = \frac{(0.1958)(20 \times 10^{-3})(75 \times 10^9)(34.907 \times 10^{-3})}{(0.231)(75 \times 10^9)} = 59.2 \times 10^6 \text{ Pa} \quad \Rightarrow \quad \tau_{\text{max}} = 59.2 \text{ MPa} \]

The torque $T$ causes a rotation of $0.6^\circ$ at end $B$ of the aluminum bar shown. Knowing that $b = 15$ mm and $G = 26$ GPa, determine the maximum shearing stress in the bar.

**SOLUTION**

$a = 30 \text{ mm} = 0.030 \text{ m}$

$b = 15 \text{ mm} = 0.015 \text{ m}$

$\phi = 0.6^\circ = 10.472 \times 10^{-3} \text{ rad}$

$\phi = \frac{TL}{c_3ab^3G} \therefore T = \frac{c_2ab^3G\phi}{c_1L}$

$\tau_{\text{max}} = \frac{T}{c_1ab^2} = \frac{c_2ab^3G\phi}{c_1ab^2L} = \frac{c_2bG\phi}{c_1L}$

$a = \frac{30}{15} = 2.0$

From Table 3.1,

$c_1 = 0.246$

$c_2 = 0.229$

$\tau_{\text{max}} = \frac{(0.229)(15 \times 10^{-3})(26 \times 10^9)(10.472 \times 10^{-3})}{(0.246)(750 \times 10^{-3})}$

$= 5.07 \times 10^6 \text{ Pa}$

$\tau_{\text{max}} = 5.07 \text{ MPa}$
PROBLEM 3.129

Two shafts are made of the same material. The cross section of shaft $A$ is a square of side $b$ and that of shaft $B$ is a circle of diameter $b$. Knowing that the shafts are subjected to the same torque, determine the ratio $\tau_A/\tau_B$ of maximum shearing stresses occurring in the shafts.

SOLUTION

A. Square: 

\[
\frac{a}{b} = 1, \quad c_1 = 0.208 \quad \text{(Table 3.1)}
\]

\[
\tau_A = \frac{T}{c_1 ab^2} = \frac{T}{0.208b^3}
\]

B. Circle:

\[
c = \frac{1}{2}b \quad \tau_B = \frac{2T}{\pi c^3} = \frac{16T}{\pi b^3}
\]

Ratio:

\[
\frac{\tau_A}{\tau_B} = \frac{1}{0.208} \cdot \frac{\pi}{16} = 0.3005\pi
\]

\[
\frac{\tau_A}{\tau_B} = 0.944
\]
PROBLEM 3.130

Shafts $A$ and $B$ are made of the same material and have the same cross-sectional area, but $A$ has a circular cross section and $B$ has a square cross section. Determine the ratio of the maximum shearing stresses occurring in $A$ and $B$, respectively, when the two shafts are subjected to the same torque ($T_A = T_B$). Assume both deformations to be elastic.

SOLUTION

Let $c$ be the radius of circular section $A$ and $b$ be the side square section $B$.

For equal areas, \[ \pi c^2 = b^2 \quad b = c\sqrt{\pi} \]

Circle:

\[ \tau_A = \frac{T_A c}{J} = \frac{2T_A}{\pi c^3} \]

Square:

\[ a = 1 \quad c_1 = 0.208 \quad \text{from Table 3.1} \]

\[ \tau_B = \frac{T_B}{c_1 b^2} = \frac{T_B}{c_1 b^3} \]

Ratio:

\[ \frac{\tau_A}{\tau_B} = \frac{2T_A}{\pi c^3} \frac{c_1 b^3}{T_B} = \frac{2c_1 b^3}{\pi c^3} \frac{T_A}{T_B} = 2c_1 \sqrt{\pi} \frac{T_A}{T_B} \]

For $T_A = T_B$, \[ \frac{\tau_A}{\tau_B} = (2)(0.208)\sqrt{\pi} \]

\[ \frac{\tau_A}{\tau_B} = 0.737 \]

\[ \frac{\tau_A}{\tau_B} = 0.737 \]
PROBLEM 3.131

Shafts $A$ and $B$ are made of the same material and have the same cross-sectional area, but $A$ has a circular cross section and $B$ has a square cross section. Determine the ratio of the maximum torques $T_A$ and $T_B$ that can be safely applied to $A$ and $B$, respectively.

SOLUTION

Let $c =$ radius of circular section $A$ and $b =$ side of square section $B$.

For equal areas $\pi c^2 = b^2$,

$$c = \frac{b}{\sqrt{\pi}}$$

Circle:

$$\tau_A = \frac{T_A c}{J} = \frac{2T_A}{\pi c^3} \quad \therefore \quad T_A = \frac{\pi}{2} c^3 \tau_A$$

Square:

From Table 3.1, $c_1 = 0.208$

$$\tau_B = \frac{T_B}{c_1 b^2} = \frac{T_B}{c_1 b^3} \quad \therefore \quad T_B = c_1 b^3 \tau_B$$

Ratio:

$$\frac{T_A}{T_B} = \frac{\frac{\pi}{2} c^3 \tau_B}{c_1 b^3 \tau_B} = \frac{\frac{\pi}{2} \cdot \frac{b^3}{\pi c_1} \tau_B}{c_1 b^3 \tau_B} = \frac{1}{2 c_1 \sqrt{\pi}} \frac{\tau_A}{\tau_B}$$

For the same stresses, $\tau_B = \tau_A$ \therefore \quad \frac{T_A}{T_B} = \frac{1}{(2)(0.208)\sqrt{\pi}} \quad \frac{T_A}{T_B} = 1.356 \quad \blacktriangle$
PROBLEM 3.132

Shafts \( A \) and \( B \) are made of the same material and have the same length and cross-sectional area, but \( A \) has a circular cross section and \( B \) has a square cross section. Determine the ratio of the maximum values of the angles \( \varphi_A \) and \( \varphi_B \) through which shafts \( A \) and \( B \), respectively, can be twisted.

SOLUTION

Let \( c = \) radius of circular section \( A \) and \( b = \) side of square section \( B \).

For equal areas,
\[
\pi c^2 = b^2 \quad \therefore \quad b = \sqrt{\pi}c
\]

Circle:
\[
\gamma_{max} = \frac{\tau_A}{G} = \frac{c\varphi_A}{L} \quad \therefore \quad \varphi_A = \frac{L\tau_A}{cG}
\]

Square: From Table 3.1,
\[
c_1 = 0.208, \quad c_2 = 0.1406
\]
\[
\tau_B = \frac{T_B}{c_1ab^2} = \frac{T_B}{0.208b^3} \quad \therefore \quad T_B = 0.208b^3\tau_B
\]
\[
\varphi_B = \frac{T_BL}{c_2ab^3G} = \frac{0.208b^3\tau_BL}{0.1406b^5G} = \frac{1.4794L\tau_B}{bG}
\]

Ratio:
\[
\frac{\varphi_A}{\varphi_B} = \frac{L\tau_A}{cG} \cdot \frac{bG}{1.4794L\tau_B} = 0.676\frac{b\tau_A}{c\tau_B} = 0.676\sqrt{\pi} \frac{\tau_A}{\tau_B}
\]

For equal stresses,
\[
\tau_A = \tau_B \quad \frac{\varphi_B}{\varphi_A} = 0.676\sqrt{\pi} \quad \frac{\varphi_B}{\varphi_A} = 1.198 \blacktriangle

**PROBLEM 3.133**

Each of the three aluminum bars shown is to be twisted through an angle of $2^\circ$. Knowing that $b = 30 \text{ mm}$, $\tau_{all} = 50 \text{ MPa}$, and $G = 27 \text{ GPa}$, determine the shortest allowable length of each bar.

**SOLUTION**

$\varphi = 2^\circ = 34.907 \times 10^{-3} \text{ rad}, \quad \tau = 50 \times 10^6 \text{ Pa} \quad G = 27 \times 10^9 \text{ Pa}, \quad b = 30 \text{ mm} = 0.030 \text{ m}$

For square and rectangle,

$$\tau = \frac{T}{c_1 ab^2} \quad \varphi = \frac{TL}{c_2 ab^3 G}$$

Divide to eliminate $T$; then solve for $L$.

$$\frac{\varphi}{\tau} = \frac{c_2 b^3 L}{c_1 b^2} \quad L = \frac{c_2 b G \varphi}{c_1 \tau}$$

(a) **Square:** $\frac{a}{b} = 1.0$ From Table 3.1, $c_1 = 0.208$, $c_2 = 0.1406$

$$L = \frac{(0.1406)(0.030)(27 \times 10^9)(34.907 \times 10^{-3})}{(0.208)(50 \times 10^6)} = 382 \times 10^{-3} \text{ m} \quad L = 382 \text{ mm} \uparrow$$

(b) **Circle:**

$$c = \frac{1}{2} b = 0.015 \text{ m} \quad \tau = \frac{Tc}{J} \quad \varphi = \frac{TL}{GJ}$$

Divide to eliminate $T$; then solve for $L$.

$$\frac{\varphi}{\tau} = \frac{JL}{cGJ} = \frac{L}{cG}$$

$$L = \frac{cG \varphi}{\tau} = \frac{(0.015)(27 \times 10^9)(34.907 \times 10^{-3})}{50 \times 10^6} = 283 \times 10^{-3} \text{ m} \quad L = 283 \text{ mm} \uparrow$$

(c) **Rectangle:** $a = 1.2b \quad \frac{a}{b} = 1.2$ From Table 3.1, $c_1 = 0.219$, $c_2 = 0.1661$

$$L = \frac{(0.1661)(0.030)(27 \times 10^9)(34.907 \times 10^{-3})}{(0.219)(50 \times 10^6)} = 429 \times 10^{-3} \text{ m} \quad L = 429 \text{ mm} \uparrow$$
PROBLEM 3.134

Each of the three steel bars is subjected to a torque as shown. Knowing that the allowable shearing stress is 8 ksi and that \( b = 1.4 \) in., determine the maximum torque \( T \) that can be applied to each bar.

SOLUTION

\[ \tau_{\text{max}} = 8 \text{ ksi}, \quad b = 1.4 \text{ in.} \]

(a) Square:
\[ a = b = 1.4 \text{ in.} \quad \frac{a}{b} = 1.0 \]

From Table 3.1,
\[ c_1 = 0.208 \]

\[ \tau_{\text{max}} = \frac{T}{c_1ab^2} \quad T = c_1ab^2\tau_{\text{max}} \]

\[ T = (0.208)(1.4)(1.4)(1.4)^2(8) \quad T = 4.57 \text{ kip \cdot in} \]

(b) Circle:
\[ c = \frac{1}{2} \quad b = 0.7 \text{ in.} \]

\[ \tau_{\text{max}} = \frac{Tc}{J} = \frac{2T}{\pi c^3} \quad T = \frac{\pi c^3}{2}\tau_{\text{max}} \]

\[ T = \frac{\pi}{2}(0.7)^3(8) \quad T = 4.31 \text{ kip \cdot in} \]

(c) Rectangle:
\[ a = (1.2)(1.4) = 1.68 \text{ in.} \quad \frac{a}{b} = 1.2 \]

From Table 3.1,
\[ c_1 = 0.219 \]

\[ T = c_1ab^2\tau_{\text{max}} = (0.219)(1.68)(1.4)^2(8) \quad T = 5.77 \text{ kip \cdot in} \]
PROBLEM 3.135

A 36-kip \cdot \text{in.} torque is applied to a 10-ft-long steel angle with an \( L8 \times 8 \times 1 \) cross section. From Appendix C, we find that the thickness of the section is 1 in. and that its area is, 15.00 in\(^2\). Knowing that \( G = 11.2 \times 10^6 \) psi, determine \((a)\) the maximum shearing stress along line \( a-a \), \((b)\) the angle of twist.

SOLUTION

\[ a = \frac{A}{t} = \frac{15\text{ in}^2}{1\text{ in.}} = 15\text{ in.,} \quad b = 1\text{ in.,} \quad \frac{a}{b} = 15 \]

Since \( \frac{a}{b} > 5 \),
\[ c_1 = c_2 = \frac{1}{3} \left( 1 - 0.630 \frac{b}{a} \right) \]

or
\[ c_1 = c_2 = \frac{1}{3} \left( 1 - \frac{0.630}{15} \right) = 0.3193 \]

\[ T = 36 \times 10^3 \text{ lb \cdot in.;} \quad L = 120\text{ in.;} \quad G = 11.2 \times 10^6 \text{ psi} \]

\((a)\) Maximum shearing stress:
\[ \tau_{\max} = \frac{T}{c_1 ab^2} \]
\[ \tau_{\max} = \frac{36 \times 10^3}{(0.3193)(15)(1)^2} = 7.52 \times 10^3 \text{ psi} \quad \tau_{\max} = 7.52 \text{ ksi} \]

\((b)\) Angle of twist:
\[ \phi = \frac{TL}{c_2 ab^2 G} \]
\[ \phi = \frac{(36 \times 10^3)(120)}{(0.3193)(15)(1)(11.2 \times 10^6)} = 0.08052 \text{ radians} \quad \phi = 4.61^\circ \]
PROBLEM 3.136

A 3-m-long steel angle has an L203 × 152 × 12.7 cross section. From Appendix C, we find that the thickness of the section is 12.7 mm and that its area is 4350 mm². Knowing that $\tau_{all} = 50 \, \text{MPa}$ and that $G = 77.2 \, \text{GPa}$, and ignoring the effect of stress concentration, determine (a) the largest torque $T$ that can be applied, (b) the corresponding angle of twist.

SOLUTION

\[ A = 4350 \, \text{mm}^2 \quad b = 12.7 \, \text{mm} \quad a = ? \]

Equivalent rectangle.

\[ a = \frac{A}{b} = \frac{4350}{12.7} = 342.52 \, \text{mm} \]

\[ \frac{a}{b} = 26.97 \]

\[ c_1 = c_2 = \frac{1}{3} \left( 1 - 0.630 \frac{b}{a} \right) = 0.32555 \]

(a) \[ \tau_{\text{max}} = \frac{T}{c_1 ab^2} \quad \tau_{\text{max}} = 50 \times 10^6 \, \text{Pa} \]

\[ T = c_1 ab^2 \tau_{\text{max}} = (0.32555)(26.97 \times 10^{-3})(12.7 \times 10^{-3})^2 (50 \times 10^6) \]

\[ = 70.807 \, \text{N} \cdot \text{m} \quad T = 70.8 \, \text{N} \cdot \text{m} \]

(b) \[ \varphi = \frac{TL}{c_2 ab^3 G} = \frac{(70.807)(3)}{(0.32555)(26.97 \times 10^{-3})(12.7 \times 10^{-3})(77.2 \times 10^9)} \]

\[ = 0.15299 \, \text{rad} \]

\[ \varphi = 8.77^\circ \]

An 8-ft-long steel member with a W8 × 31 cross section is subjected to a 5-kip · in. torque. The properties of the rolled-steel section are given in Appendix C. Knowing that \( G = 11.2 \times 10^6 \) psi, determine (a) the maximum shearing stress along line \( a-a \), (b) the maximum shearing stress along line \( b-b \), (c) the angle of twist. \( \text{Hint: consider the web and flanges separately and obtain a relation between the torques exerted on the web and a flange, respectively, by expressing that the resulting angles of twist are equal.} \)

\]
\[
T_f = c_2 ab^3 \frac{G \varphi_f}{L} = K_f \frac{G \varphi}{L} \quad \text{where} \quad K_f = c_2 ab^3

For matching twist angles:
\[

Total torque:
\[

\[
T_f = \frac{(0.2138)(5000)}{(2)(0.2138) + 0.0563} = 2221 \text{ lb · in}; \quad T_w = \frac{(0.0563)(5000)}{(2)(0.2138) + 0.0563} = 557 \text{ lb · in}

PROBLEM 3.138

A 4-m-long steel member has a W310 × 60 cross section. Knowing that \( G = 77.2 \text{ GPa} \) and that the allowable shearing stress is 40 MPa, determine (a) the largest torque \( T \) that can be applied, (b) the corresponding angle of twist. Refer to Appendix C for the dimensions of the cross section and neglect the effect of stress concentrations. (See hint of Prob. 3.137.)

SOLUTION

\[ \text{W310} \times 60, \quad L = 4 \text{ m}, \quad G = 77.2 \text{ GPa}, \quad \tau_{\text{all}} = 40 \text{ MPa} \]

For one flange: From App. C, \( a = 203 \text{ mm}, \quad b = 13.1 \text{ mm}, \quad a/b = 15.50 \)

Eq. (3.45): \[ c_1 = c_2 = \frac{1}{3} \left( 1 - \frac{0.630}{15.50} \right) = 0.320 \]

Eq. (3.44): \[ \phi_f = \frac{T_f L}{c_2 a b^5 G} = \frac{T_f (4)}{0.320(0.203)(0.0131)^3(77.2 \times 10^9)} \]

\[ \phi_f = 355.04 \times 10^{-6} T_f \]  

For web: From App. C, \( a = 303 - 2(13.1) = 276.8 \text{ mm}, \quad b = 7.5 \text{ mm}, \quad a/b = 36.9 \)

Eq. (3.45): \[ c_1 = c_2 = \frac{1}{3} \left( 1 - \frac{0.630}{36.9} \right) = 0.328 \]

Eq. (3.44): \[ \phi_w = \frac{T_w (4)}{0.328(0.2768)(0.0075)^3(77.2 \times 10^9)} \]

\[ \phi_w = 1.354.2 \times 10^{-6} T_w \]  

Since angle of twist is the same for flanges and web:

\[ \phi_f = \phi_w: \]

\[ 355.04 \times 10^{-6} T_f = 1354.2 \times 10^{-6} T_w \]

\[ T_f = 3.814 T_w \]  

(3)

But the sum of the torques exerted on the two flanges and on the web is equal to the torque \( T \) applied to the member:

\[ 2T_f + T_w = T \]  

(4)
PROBLEM 3.138 (Continued)

Substituting for $T_f$ from (3) into (4):

$$2(3.814T_w) + T_w = T \quad T_w = 0.11589T$$  \hspace{1cm} (5)

From (3):

$$T_f = 3.814(0.11589T) \quad T_f = 0.44205T$$  \hspace{1cm} (6)

For one flange:

From Eq. (3.43):

$$T_f = c_f a b^2 \tau_{\text{max}} = 0.320(0.203)(0.0131)^2(40 \times 10^6)$$

$$= 445.91 \text{ N} \cdot \text{m}$$

Eq. (6):

$$445.91 = 0.44205T \quad T = 1009 \text{ N} \cdot \text{m}$$

For web:

$$T_w = c_f a b^2 \tau_{\text{max}} = 0.328(0.2768)(0.0075)^2(40 \times 10^6)$$

$$= 204.28 \text{ N} \cdot \text{m}$$

Eq. (5):

$$204.28 = 0.11589T \quad T = 1763 \text{ N} \cdot \text{m}$$

(a) Largest allowable torque: Use the smaller value. $T = 1009 \text{ N} \cdot \text{m}$

(b) Angle of twist: Use $T_f$, which is critical.

Eq. (1):

$$\phi = \phi_f = (355.04 \times 10^{-6})(445.91) = 0.15831 \text{ rad} \quad \phi = 9.07^\circ$$

$$\tau = 31.5 \times 10^6 \, \text{Pa}$$

$\tau = 31.5 \, \text{MPa}$

A 5.6 kN⋅m torque is applied to a hollow shaft having the cross section shown. Neglecting the effect of stress concentrations, determine the shearing stress at points \( a \) and \( b \).

**SOLUTION**

Area bounded by centerline.

\[
a = (96\text{ mm})(95\text{ mm}) + \frac{\pi}{2}(47.5\text{ mm})^2 = 12.664 \times 10^3 \text{ mm}^2 = 12.664 \times 10^{-3} \text{ m}^2

At point \( a \), \( t = 5\text{ mm} = 0.005\text{ m} \)

\[

PROBLEM 3.144

A hollow brass shaft has the cross section shown. Knowing that the shearing stress must not exceed 12 ksi and neglecting the effect of stress concentrations, determine the largest torque that can be applied to the shaft.

SOLUTION

Calculate the area bounded by the center line of the wall cross section. The area is a rectangle with two semi-circular cutouts.

\[ a = bh - 2\left(\frac{\pi r^2}{2}\right) = (4.8)(5.5) - \pi(1.6)^2 = 18.3575 \text{ in}^2 \]

\[ \tau_{\text{max}} = \frac{T}{2at_{\text{min}}} \]

\[ \tau_{\text{max}} = 12 \times 10^3 \text{ psi} \quad t_{\text{min}} = 0.2 \text{ in.} \]

\[ T = 2at_{\text{min}} \tau_{\text{max}} = (2)(18.3575)(0.2)(12 \times 10^3) = 88.116 \times 10^3 \text{ lb} \cdot \text{in} \]

SOLUTION

Area bounded by centerline.

\[
a = (5.94)(2.94 - d) + 1.94 \cdot d = 17.4636 - 4.00d
\]

\[
t = 0.06 \text{ in., } \tau = 750 \text{ psi, } T = 1250 \text{ lb} \cdot \text{in}

\[
\tau = \frac{T}{2at}

\[
a = \frac{T}{2\tau}
\]

\[
17.4636 - 4.00d = \frac{1250}{(2)(0.06)(750)} = 13.8889

SOLUTION

Radius of outer circle = 1.2 in.
Radius of inner circle = 1.1 in.

PROBLEM 3.148

A cooling tube having the cross section shown is formed from a sheet of stainless steel of 3-mm thickness. The radii $c_1 = 150$ mm and $c_2 = 100$ mm are measured to the center line of the sheet metal. Knowing that a torque of magnitude $T = 3 \text{kN} \cdot \text{m}$ is applied to the tube, determine (a) the maximum shearing stress in the tube, (b) the magnitude of the torque carried by the outer circular shell. Neglect the dimension of the small opening where the outer and inner shells are connected.

SOLUTION

Area bounded by centerline,

$$a = \pi \left( c_1^2 - c_2^2 \right) = \pi (150^2 - 100^2) = 39.27 \times 10^3 \text{mm}^2$$

$$= 39.27 \times 10^{-3} \text{m}^2$$

$$t = 0.003 \text{m}$$

(a) \[ \tau = \frac{T}{2ta} = \frac{3 \times 10^3}{(2)(0.003)(39.27 \times 10^{-3})} = 12.73 \times 10^6 \text{Pa} \]

$$\tau = 12.76 \text{MPa}$$

(b) \[ T_1 = (2\pi c_1 t \tau c_1) = 2\pi c_1^2 t \tau \]

$$= 2\pi (0.150)^2 (0.003)(12.73 \times 10^6) = 5.40 \times 10^3 \text{N} \cdot \text{m}$$

$$T_1 = 5.40 \text{kN} \cdot \text{m}$$
PROBLEM 3.149

A hollow cylindrical shaft of length \( L \), mean radius \( c_m \), and uniform thickness \( t \) is subjected to a torque of magnitude \( T \). Consider, on the one hand, the values of the average shearing stress \( \tau_{\text{ave}} \) and the angle of twist \( \phi \) obtained from the elastic torsion formulas developed in Sections 3.4 and 3.5 and, on the other hand, the corresponding values obtained from the formulas developed in Sec. 3.13 for thin-walled shafts. (a) Show that the relative error introduced by using the thin-walled-shaft formulas rather than the elastic torsion formulas is the same for \( \tau_{\text{ave}} \) and \( \phi \) and that the relative error is positive and proportional to the ratio \( \frac{t}{c_m} \). (b) Compare the percent error corresponding to values of the ratio \( \frac{t}{c_m} \) of 0.1, 0.2, and 0.4.

SOLUTION

Let \( c_2 = \) outer radius = \( c_m + \frac{1}{2} t \) and \( c_1 = \) inner radius = \( c_m - \frac{1}{2} t \)

\[
J = \frac{\pi}{2} \left( c_2^4 - c_1^4 \right) = \frac{\pi}{2} \left( c_2^2 + c_1^2 \right) \left( c_2 + c_1 \right) \left( c_2 - c_1 \right) = \frac{\pi}{2} \left( c_m^2 + c_m t + \frac{1}{4} t^2 + c_m^2 - c_m t + \frac{1}{4} t^2 \right) (2c_m) t \]

\[
= 2\pi \left( c_m^2 + \frac{1}{4} t^2 \right) c_m t
\]

\[
\tau_m = \frac{Te_m}{J} = \frac{T}{2\pi \left( c_m^2 + \frac{1}{4} t^2 \right) t}
\]

\[
\phi_1 = \frac{T L}{J G} = \frac{T L}{2\pi \left( c_m^2 + \frac{1}{4} t^2 \right) c_m t G}
\]

Area bounded by centerline,

\[
a = \pi c_m^2
\]

\[
\tau_{\text{ave}} = \frac{T}{2at} = \frac{T}{2\pi c_m^2 t}
\]

\[
\phi_2 = \frac{TL}{4\pi^2 G} \int \frac{ds}{t} = \frac{TL \left( 2\pi c_m^2 \right)}{4\left( \pi c_m^2 \right)^2 G} = \frac{TL}{2\pi c_m^2 t G}
\]

(a) Ratios:

\[
\frac{\tau_{\text{ave}}}{\tau_m} = \frac{T}{2\pi c_m^2 t} \times \frac{2\pi \left( c_m^2 + \frac{1}{4} t^2 \right) t}{T} = 1 + \frac{t^2}{4 c_m^2}
\]

\[
\frac{\phi_2}{\phi_1} = \frac{TL}{2\pi c_m^2 t G} \times \frac{2\pi \left( c_m^2 + \frac{1}{4} t^2 \right) c_m t G}{TL} = 1 + \frac{t^2}{4 c_m}

PROBLEM 3.150

Equal torques are applied to thin-walled tubes of the same length $L$, same thickness $t$, and same radius $c$. One of the tubes has been slit lengthwise as shown. Determine (a) the ratio $\tau_b / \tau_a$ of the maximum shearing stresses in the tubes, (b) the ratio $\phi_b / \phi_a$ of the angles of twist of the shafts.

SOLUTION

Without slit:

Area bounded by centerline, $a = \pi c^2$

\[
\tau_a = \frac{T}{2ta} = \frac{T}{2\pi c^2 t}
\]

\[
J = 2\pi c^3 t \quad \phi_a = \frac{TL}{GJ} = \frac{TL}{2\pi c^3 t G}
\]

With slit:

\[
a = 2\pi c, \quad b = t, \quad \frac{a}{b} = \frac{2\pi c}{t} >> 1
\]

\[
c_1 = c_2 = \frac{1}{3}
\]

\[
\tau_b = \frac{T}{c_1 ab^2} = \frac{3T}{2\pi ct^2}
\]

\[
\phi_b = \frac{T}{c_2 ab^3 G} = \frac{3TL}{2\pi ct^3 G}
\]

(a) Stress ratio:

\[
\frac{\tau_b}{\tau_a} = \frac{3T}{2\pi ct^2} \cdot \frac{2\pi c^3 t}{T} = \frac{3c}{t}
\]

\[
\frac{\tau_b}{\tau_a} = \frac{3c}{t} \Rightarrow
\]

(b) Twist ratio:

\[
\frac{\phi_b}{\phi_a} = \frac{3TL}{2\pi ct^3 G} \cdot \frac{2\pi c^3 t G}{TL} = \frac{3c^2}{t^2}
\]

\[
\frac{\phi_b}{\phi_a} = \frac{3c^2}{t^2} \Rightarrow

PROBLEM 3.151

The ship at A has just started to drill for oil on the ocean floor at a depth of 5000 ft. Knowing that the top of the 8-in.-diameter steel drill pipe \((G = 11.2 \times 10^6 \text{ psi})\) rotates through two complete revolutions before the drill bit at B starts to operate, determine the maximum shearing stress caused in the pipe by torsion.

SOLUTION

\[
\varphi = \frac{TL}{GJ}, \quad T = \frac{GJ\varphi}{L},
\]

\[
\tau = \frac{T_c}{J} = \frac{GJc\varphi}{JL} = \frac{G\varphi c}{L}
\]

\[
\varphi = 2 \text{ rev} = (2)(2\pi) = 12.566 \text{ rad}, \quad c = \frac{1}{2}d = 4.0 \text{ in.}
\]

\[
L = 5000 \text{ ft} = 60000 \text{ in.}

\[
\tau = \frac{(11.2 \times 10^6)(12.566)(4.0)}{60000} = 9.3826 \times 10^5 \text{ psi} \quad \tau = 9.38 \text{ ksi}

PROBLEM 3.152

The shafts of the pulley assembly shown are to be redesigned. Knowing that the allowable shearing stress in each shaft is 8.5 ksi, determine the smallest allowable diameter of (a) shaft AB, (b) shaft BC.

SOLUTION

(a) Shaft AB: \[ T_{AB} = 3.6 \times 10^3 \text{ lb} \cdot \text{in} \]
\[ \tau_{\text{max}} = 8.5 \text{ ksi} = 8.5 \times 10^3 \text{ psi} \]
\[ J = \frac{\pi}{2} c^4 \quad \tau_{\text{max}} = \frac{T_c}{J} = \frac{2T}{\pi c^3} \]
\[ c = \sqrt[3]{\frac{2T_{AB}}{\pi \tau_{\text{max}}}} = \sqrt[3]{\frac{(2)(3.6 \times 10^3)}{\pi (8.5 \times 10^3)}} = 0.646 \text{ in.} \]
\[ d_{AB} = 2c = 1.292 \text{ in.} \]

(b) Shaft BC: \[ T_{BC} = 6.8 \times 10^3 \text{ lb} \cdot \text{in} \]
\[ \tau_{\text{max}} = 8.5 \times 10^3 \text{ psi} \]
\[ c = \sqrt[3]{\frac{2T_{BC}}{\pi \tau_{\text{max}}}} = \sqrt[3]{\frac{(2)(6.8 \times 10^3)}{\pi (8.5 \times 10^3)}} = 0.7985 \text{ in.} \]
\[ d_{BC} = 2c = 1.597 \text{ in.} \]
PROBLEM 3.153

A steel pipe of 12-in. outer diameter is fabricated from \( \frac{1}{4} \)-in.-thick plate by welding along a helix which forms an angle of 45° with a plane perpendicular to the axis of the pipe. Knowing that the maximum allowable tensile stress in the weld is 12 ksi, determine the largest torque that can be applied to the pipe.

SOLUTION

From Eq. (3.14) of the textbook,

\[
\sigma_{45} = \tau_{\text{max}}
\]

hence,

\[
\tau_{\text{max}} = 12 \text{ksi} = 12 \times 10^3 \text{ psi}
\]

\[
c_2 = \frac{1}{2} d_0 = \frac{1}{2} (12) = 6.00 \text{ in.}
\]

\[
c_1 = c_2 - t = 6.00 - 0.25 = 5.75 \text{ in.}
\]

\[
J = \frac{\pi}{2} (c_2^4 - c_1^4) = \frac{\pi}{2} [(6.00)^4 - (5.75)^4] = 318.67 \text{ in.}^2
\]

\[
\tau_{\text{max}} = \frac{T_c}{J} \quad T = \frac{\tau_{\text{max}} J}{c}
\]

\[
T = \frac{(12 \times 10^3)(318.67)}{6.00} = 637 \times 10^3 \text{ lb \cdot in}
\]

\[ T = 637 \text{ kip \cdot in} \]

For the gear train shown, the diameters of the three solid shafts are:

\[ d_{AB} = 20 \text{ mm} \quad d_{CD} = 25 \text{ mm} \quad d_{EF} = 40 \text{ mm} \]

Knowing that for each shaft the allowable shearing stress is 60 MPa, determine the largest torque \( T \) that can be applied.

**SOLUTION**

Statics:

\[
\frac{T_{CD}}{r_C} = \frac{T_{AB}}{r_B} \quad T_{CD} = \frac{r_C}{r_B} T_{AB} = \frac{75}{30} T = 2.5 T

\[
\frac{T_{EF}}{r_F} = \frac{T_{CD}}{r_D} \quad T_{EF} = \frac{r_F}{r_D} T_{CD} = \frac{90}{30} (2.5 T) = 7.5 T
\]

Determine the magnitude of \( T \) so that the stress is 60 MPa = \( 60 \times 10^6 \) Pa.

\[
\tau = \frac{T_c}{J} \quad T_{\text{shaft}} = \frac{J \tau}{c} = \frac{\pi}{2} \tau c^3

\[
T_{AB} = T = \frac{\pi}{2} (60 \times 10^6)(0.010)^3 \quad T = 94.2 \text{ N} \cdot \text{m}

Shaft \( CD \):

\[
c = \frac{1}{2} d_{CD} = 12.5 \text{ mm} = 0.0125 \text{ m}

\[
T_{CD} = 2.5 T = \frac{\pi}{2} (60 \times 10^6)(0.0125)^3 \quad T = 73.6 \text{ N} \cdot \text{m}

Shaft \( EF \):

\[
c = \frac{1}{2} d_{EF} = 20 \text{ mm} = 0.020 \text{ m}

\[
T_{EF} = 7.5 T = \frac{\pi}{2} (60 \times 10^6)(0.020)^3 \quad T = 100.5 \text{ N} \cdot \text{m}

The smallest value of \( T \) is the largest torque that can be applied.

\[

PROBLEM 3.156

In the bevel-gear system shown, $\alpha = 18.43^\circ$. Knowing that the allowable shearing stress is 8 ksi in each shaft and that the system is in equilibrium, determine the largest torque $T_A$ that can be applied at $A$.

SOLUTION

Using stress limit for shaft $A$:

\[ \tau = 8 \text{ ksi}, \quad c = \frac{1}{2}d = 0.25 \text{ in.} \]

\[ T_A = \frac{J\tau}{c} = \frac{\pi}{2} \tau c^3 = \frac{\pi}{2} (8)(0.25)^3 = 0.1963 \text{ kip \cdot in} \]

Using stress limit for shaft $B$:

\[ \tau = 8 \text{ ksi}, \quad c = \frac{1}{2}d = 0.3125 \text{ in.} \]

\[ T_B = \frac{J\tau}{c} = \frac{\pi}{2} \tau c^3 = \frac{\pi}{2} (8)(0.3125)^3 = 0.3835 \text{ kip \cdot in} \]

From statics,

\[ T_A = \frac{r_A}{r_B} T_B = (\tan \alpha)T_B \]

\[ T_A = (\tan 18.43^\circ)(0.3835) = 0.1278 \text{ kip \cdot in} \]

The allowable value of $T_A$ is the smaller.

\[ T_A = 0.1278 \text{ kip \cdot in} \quad T_A = 127.8 \text{ lb \cdot in} \]

Deformations:

For all shafts, \[ c = \frac{1}{2}d = 0.375 \text{ in.} \]
\[ J = \frac{\pi}{2} c^4 = 0.031063 \text{ in}^4 \]
\[ \varphi_{AB} = \frac{T_{AB}L_{AB}}{GJ} = \frac{(100)(48)}{(11.2 \times 10^6)(0.031063)} = 0.013797 \text{ rad} \]
\[ \varphi_{EF} = \frac{T_{EF}L_{EF}}{GJ} = \frac{(200)(48)}{(11.2 \times 10^6)(0.031063)} = 0.027594 \text{ rad} \]
\[ \varphi_{CD} = \frac{T_{CD}L_{CD}}{GJ} = \frac{(1000)(36)}{(11.2 \times 10^6)(0.031063)} = 0.103476 \text{ rad} \]

Kinematics: \[ \varphi_C = \varphi_{CD} = 0.103476 \text{ rad} \]
\[ r_B \varphi_B = r_C \varphi_C \quad \varphi_B = \frac{r_C}{r_B} \varphi_C \cdot \frac{6}{1.5}(0.103476) = 0.41390 \text{ rad} \]

(a) \[ \varphi_A = \varphi_B + \varphi_{AB} = 0.41390 + 0.01397 = 0.42788 \text{ rad} \quad \varphi_A = 24.5^\circ \]

(b) \[ \varphi_E = \varphi_F + \varphi_{EF} = 0.31043 + 0.027594 = 0.33802 \text{ rad} \quad \varphi_E = 19.37^\circ \]
PROBLEM 3.158

The design specifications of a 1.2-m-long solid transmission shaft require that the angle of twist of the shaft not exceed $4^\circ$ when a torque of 750 N·m is applied. Determine the required diameter of the shaft, knowing that the shaft is made of a steel with an allowable shearing stress of 90 MPa and a modulus of rigidity of 77.2 GPa.

SOLUTION

\[
T = 750 \text{ N} \cdot \text{m}, \quad \theta = 4^\circ = 69.813 \times 10^{-3} \text{ rad},
\]

\[
L = 1.2 \text{ m}, \quad J = \frac{\pi}{2} c^4
\]

\[
\tau = 90 \text{ MPa} = 90 \times 10^6 \text{ Pa} \quad G = 77.2 \text{ GPa} = 77.2 \times 10^9 \text{ Pa}
\]

Based on angle of twist,

\[
\theta = \frac{TL}{GJ} = \frac{2TL}{\pi G c^4}
\]

\[
c = \sqrt[4]{\frac{2TL}{\pi G \theta}} = \sqrt[4]{\frac{(2)(750)(1.2)}{\pi(77.2 \times 10^9)(69.813 \times 10^{-3})}} = 18.06 \times 10^{-3} \text{ m}
\]

Based on shearing stress,

\[
\tau = \frac{Tc}{J} = \frac{2T}{\pi c^3}
\]

\[
c = \sqrt[3]{\frac{2T}{\pi \tau}} = \sqrt[3]{\frac{(2)(750)}{\pi(90 \times 10^6)}} = 17.44 \times 10^{-3} \text{ m}
\]

Use larger value. \(c = 18.06 \times 10^{-3} \text{ m} = 18.06 \text{ mm}\)

\[d = 2c = 36.1 \text{ mm}\]
PROBLEM 3.159

The stepped shaft shown rotates at 450 rpm. Knowing that \( r = 0.5 \text{ in.} \), determine the maximum power that can be transmitted without exceeding an allowable shearing stress of 7500 psi.

SOLUTION

\[ d = 5 \text{ in.} \]
\[ D = 6 \text{ in.} \]
\[ r = 0.5 \text{ in.} \]
\[ \frac{D}{d} = \frac{6}{5} = 1.20 \]
\[ \frac{r}{d} = \frac{0.5}{5} = 0.10 \]

From Fig. 3.32,
\[ K = 1.33 \]

For smaller side,
\[ c = \frac{1}{2}d = 2.5 \text{ in.} \]
\[ \tau = \frac{KTc}{J} = \frac{2KT}{\pi c^3} \]
\[ T = \frac{\pi c^3 \tau}{2K} = \frac{\pi (2.5)^3 (7500)}{(2)(1.33)} = 138.404 \times 10^3 \text{ lb \cdot in} \]
\[ f = 450 \text{ rpm} = 7.5 \text{ Hz} \]

Power,
\[ P = 2\pi f T = 2\pi (7.5)(138.404 \times 10^3) = 6.52 \times 10^6 \text{ in \cdot lb/s} \]

Recalling that 1 hp = 6600 in \cdot lb/s,
\[ P = 988 \text{ hp} \]
PROBLEM 3.160

A 750-N \cdot m torque is applied to a hollow shaft having the cross section shown and a uniform 6-mm wall thickness. Neglecting the effect of stress concentrations, determine the shearing stress at points \( a \) and \( b \).

SOLUTION

Area bounded by centerline.

\[
a = \frac{\pi}{2} (33)^2 + (60)(66) = 7381 \text{ mm}^2
\]

\[
= 7381 \times 10^{-6} \text{ m}^2
\]

\( t = 0.006 \text{ m at both } a \text{ and } b, \)

Then at points \( a \) and \( b \),

\[
\tau = \frac{T}{2ta} = \frac{750}{(2)(0.006)(7381 \times 10^{-6})} = 8.47 \times 10^6 \text{ Pa}
\]

\( \tau = 8.47 \text{ MPa} \)
PROBLEM 3.161

The composite shaft shown is twisted by applying a torque $T$ at end $A$. Knowing that the maximum shearing stress in the steel shell is 150 MPa, determine the corresponding maximum shearing stress in the aluminum core. Use $G = 77.2$ GPa for steel and $G = 27$ GPa for aluminum.

**SOLUTION**

Let $G_1$, $J_1$, and $\tau_1$ refer to the aluminum core and $G_2$, $J_2$, and $\tau_2$ refer to the steel shell.

At the outer surface on the steel shell,

$$ \gamma_2 = \frac{c_2 \phi}{L} \quad \therefore \quad \phi = \frac{\gamma_2}{c_2} = \frac{\tau_2}{c_2 G_2} $$

At the outer surface of the aluminum core,

$$ \gamma_1 = \frac{c_1 \phi}{L} \quad \therefore \quad \phi = \frac{\gamma_1}{c_1} = \frac{\tau_1}{c_1 G_1} $$

Matching $\frac{\phi}{L}$ for both components,

$$ \frac{\tau_2}{c_2 G_2} = \frac{\tau_1}{c_1 G_1} $$

Solving for $\tau_2$,

$$ \tau_2 = \frac{c_2}{c_1} \cdot \frac{G_5}{G_1} \cdot \tau_1 = \frac{0.030}{0.040} \cdot \frac{27 \times 10^9}{77.2 \times 10^9} \cdot 150 \times 10^6 = 39.3 \times 10^6 \text{ Pa} $$

$$ \tau_2 = 39.3 \text{ MPa} \blacktriangleleft $
PROBLEM 3.162

Two solid brass rods \( AB \) and \( CD \) are brazed to a brass sleeve \( EF \). Determine the ratio \( d_2/d_1 \) for which the same maximum shearing stress occurs in the rods and in the sleeve.

SOLUTION

Let \( c_1 = \frac{1}{2}d_1 \) and \( c_2 = \frac{1}{2}d_2 \).

Shaft \( AB \):

\[
\tau_1 = \frac{TC_1}{J_1} = \frac{2T}{\pi c_1^3}
\]

Sleeve \( EF \):

\[
\tau_2 = \frac{TC_2}{J_2} = \frac{2TC_2}{\pi \left(c_2^4 - c_1^4\right)}
\]

For equal stresses,

\[
\frac{2T}{\pi c_1^3} = \frac{2TC_2}{\pi \left(c_2^4 - c_1^4\right)}
\]

\[
c_2^4 - c_1^4 = c_1^3 c_2
\]

Let \( x = \frac{c_2}{c_1} \)

\(x^4 - 1 = x\) or \(x = \sqrt[4]{1 + x}\)

Solve by successive approximations starting with \(x_0 = 1.0\).

\[
x_1 = \sqrt[4]{2} = 1.189, \quad x_2 = \sqrt[4]{2.189} = 1.216, \quad x_3 = \sqrt[4]{2.216} = 1.220
\]

\[
x_4 = \sqrt[4]{2.220} = 1.221, \quad x_5 = \sqrt[4]{2.221} = 1.221 \quad \text{(converged)}
\]

\[
x = 1.221, \quad \frac{c_2}{c_1} = 1.221 \quad \frac{d_2}{d_1} = 1.221
\]
PROBLEM 4.1

Knowing that the couple shown acts in a vertical plane, determine the stress at \((a)\) point \(A\), \((b)\) point \(B\).

SOLUTION

For rectangle: \[ I = \frac{1}{12}bh^3 \]

For cross sectional area:
\[ I = I_1 + I_2 + I_3 = \frac{1}{12}(2)(1.5)^3 + \frac{1}{12}(2)(5.5)^3 + \frac{1}{12}(2)(1.5)^3 = 28.854 \text{ in}^4 \]

\((a)\) \(y_A = 2.75\ \text{in.}\)
\[ \sigma_A = -\frac{My_A}{I} = -\frac{(25)(2.75)}{28.854} \]
\[ \sigma_A = -2.38 \text{ ksi} \]

\((b)\) \(y_B = 0.75\ \text{in.}\)
\[ \sigma_B = -\frac{My_B}{I} = -\frac{(25)(0.75)}{28.854} \]
\[ \sigma_B = -0.650 \text{ ksi} \]
PROBLEM 4.2

Knowing that the couple shown acts in a vertical plane, determine the stress at (a) point A, (b) point B.

SOLUTION

For rectangle: $I = \frac{1}{12}bh^3$

Outside rectangle: $I_1 = \frac{1}{12}(80)(120)^3$

$I_1 = 11.52 \times 10^6 \text{ mm}^4 = 11.52 \times 10^{-6} \text{ m}^4$

Cutout: $I_2 = \frac{1}{12}(40)(80)^3$

$I_2 = 1.70667 \times 10^6 \text{ mm}^4 = 1.70667 \times 10^{-6} \text{ m}^4$

Section: $I = I_1 - I_2 = 9.81333 \times 10^{-6} \text{ m}^4$

(a) $y_A = 40 \text{ mm} = 0.040 \text{ m}$

$\sigma_A = -\frac{My_A}{I} = -\frac{(15 \times 10^3)(0.040)}{9.81333 \times 10^{-6}} = -61.6 \times 10^6 \text{ Pa}$

$\sigma_A = -61.6 \text{ MPa}$

(b) $y_B = -60 \text{ mm} = -0.060 \text{ m}$

$\sigma_B = -\frac{My_B}{I} = -\frac{(15 \times 10^3)(-0.060)}{9.81333 \times 10^{-6}} = 91.7 \times 10^6 \text{ Pa}$

$\sigma_B = 91.7 \text{ MPa}$
PROBLEM 4.3

\[ c = 0.6 \text{ in.} \]
\[ \sigma = \frac{Mc}{I} : \quad M = \frac{\sigma I}{c} = \frac{(16)(52.7 \times 10^{-3})}{0.6} \]
\[ M = 1.405 \text{ kip} \cdot \text{in} \]

(b) \[ I = \frac{\pi}{4} (0.7^4 - 0.5^4) = 139.49 \times 10^{-3} \text{ in}^4 \]
\[ c = 0.7 \text{ in.} \]
\[ \sigma = \frac{Mc}{I} : \quad M = \frac{\sigma I}{c} = \frac{(16)(139.49 \times 10^{-3})}{0.7} \]
\[ M = 3.19 \text{ kip} \cdot \text{in} \]

SOLUTION

Properties of W4 × 13 rolled section.
(See Appendix C.)

Area = 3.83 in$^2$
Depth = 4.16 in.
$I_x = 11.3$ in$^4$

For one rolled section, moment of inertia about axis $a-a$ is

$$I_a = I_x + A d^2 = 11.3 + (3.83)(2.08)^2 = 27.87 \text{ in}^4$$

For both sections,

SOLUTION

Properties of W4 × 13 rolled section.
(See Appendix C.)

PROBLEM 4.11

Two vertical forces are applied to a beam of the cross section shown. Determine the maximum tensile and compressive stresses in portion BC of the beam.

SOLUTION

Neutral axis lies 4.778 in. above the base.

\[ I_1 = \frac{1}{12} h_1 h_1^3 + A_1 d_1^2 = \frac{1}{12} (8)(1)^3 + (8)(2.772)^2 = 59.94 \text{ in}^4 \]
\[ I_2 = \frac{1}{12} h_2 h_2^3 + A_2 d_2^2 = \frac{1}{12} (1)(6)^3 + (6)(0.778)^2 = 21.63 \text{ in}^4 \]
\[ I_3 = \frac{1}{12} h_3 h_3^3 + A_3 d_3^2 = \frac{1}{12} (4)(1)^3 + (4)(4.278)^2 = 73.54 \text{ in}^4 \]
\[ I = I_1 + I_2 + I_3 = 59.94 + 21.63 + 73.57 = 155.16 \text{ in}^4 \]

\[ y_{top} = 3.222 \text{ in.} \]
\[ y_{bot} = 4.778 \text{ in.} \]

\[ M - Pa = 0 \]
\[ M = Pa = (25)(20) = 500 \text{ kip} \cdot \text{in} \]

\[ \sigma_{top} = -\frac{My_{top}}{I} = -\frac{(500)(3.222)}{155.16} = -10.38 \text{ ksi (compression)} \]
\[ \sigma_{bot} = -\frac{My_{bot}}{I} = -\frac{(500)(-4.778)}{155.16} = 15.40 \text{ ksi (tension)} \]
PROBLEM 4.12

Knowing that a beam of the cross section shown is bent about a horizontal axis and that the bending moment is $6 \text{kN} \cdot \text{m}$, determine the total force acting on the top flange.

SOLUTION

The stress distribution over the entire cross section is given by the bending stress formula:

$$\sigma_x = -\frac{M_y}{I}$$

where $y$ is a coordinate with its origin on the neutral axis and $I$ is the moment of inertia of the entire cross sectional area. The force on the shaded portion is calculated from this stress distribution. Over an area element $dA$, the force is

$$dF = \sigma_x dA = -\frac{M_y}{I} dA$$

The total force on the shaded area is then

$$F = \int dF = -\int \frac{M_y}{I} dA = -\frac{M}{I} \int ydA = -\frac{M}{I} \bar{y}^* A^*$$

where $\bar{y}^*$ is the centroidal coordinate of the shaded portion and $A^*$ is its area.

$$d_1 = 54 - 18 = 36 \text{ mm}$$
$$d_2 = 54 + 36 - 54 = 36 \text{ mm}$$
**PROBLEM 4.12 (Continued)**

Moment of inertia of entire cross section:

\[
I_1 = \frac{1}{12} b_1 h_1^3 + A_1 d_1^2 = \frac{1}{12} (216)(36)^3 + (216)(36)^2 = 10.9175 \times 10^6 \text{ mm}^4
\]

\[
I_2 = \frac{1}{12} b_2 h_2^3 + A_2 d_2^2 = \frac{1}{12} (72)(108)^3 + (72)(108)(36)^2 = 17.6360 \times 10^6 \text{ mm}^4
\]

\[
I = I_1 + I_2 = 28.5535 \times 10^6 \text{ mm}^4 = 28.5535 \times 10^{-6} \text{ m}^4
\]

For the shaded area,

\[
A^* = (216)(36) = 7776 \text{ mm}^2
\]

\[
\bar{y}^* = 36 \text{ mm}
\]

\[
A^* \bar{y}^* = 279.936 \times 10^3 \text{ mm}^3 = 279.936 \times 10^{-6} \text{ m}^3
\]

\[
F = \frac{MA^* \bar{y}^*}{I} = \frac{(6 \times 10^3)(279.936 \times 10^{-6})}{28.5535 \times 10^{-6}} = 58.8 \times 10^3 \text{ N}
\]

\[F = 58.8 \text{ kN}\]
PROBLEM 4.13

Knowing that a beam of the cross section shown is bent about a horizontal axis and that the bending moment is 6 kN \cdot m, determine the total force acting on the shaded portion of the web.

SOLUTION

The stress distribution over the entire cross section is given by the bending stress formula:

\[ \sigma_x = -\frac{My}{I} \]

where \( y \) is a coordinate with its origin on the neutral axis and \( I \) is the moment of inertia of the entire cross sectional area. The force on the shaded portion is calculated from this stress distribution. Over an area element \( dA \), the force is

\[ dF = \sigma_x dA = -\frac{My}{I} dA \]

The total force on the shaded area is then

\[ F = \int dF = -\int \frac{My}{I} dA = -\frac{M}{I} \int y dA = -\frac{M}{I} y^* A^* \]

where \( y^* \) is the centroidal coordinate of the shaded portion and \( A^* \) is its area.

\[ d_1 = 54 - 18 = 36 \text{ mm} \]
\[ d_2 = 54 + 36 - 54 = 36 \text{ mm} \]
PROBLEM 4.13 (Continued)

Moment of inertia of entire cross section:

\[ I_1 = \frac{1}{12} b_1 h_1^3 + A_1 d_1^2 = \frac{1}{12} (216)(36)^3 + (216)(36)(36)^2 = 10.9175 \times 10^6 \text{ mm}^4 \]

\[ I_2 = \frac{1}{12} b_2 h_2^3 + A_2 d_2^2 = \frac{1}{12} (72)(108)^3 + (72)(108)(36)^2 = 17.6360 \times 10^6 \text{ mm}^4 \]

\[ I = I_1 + I_2 = 28.5535 \times 10^6 \text{ mm}^4 = 28.5535 \times 10^{-6} \text{ m}^4 \]

For the shaded area,

\[ A^* = (72)(90) = 6480 \text{ mm}^2 \]

\[ \bar{y}^* = 45 \text{ mm} \]

\[ A^* \bar{y}^* = 291.6 \times 10^3 \text{ mm}^3 = 291.6 \times 10^{-6} \text{ m} \]

\[ F = \frac{MA^* \bar{y}^*}{I} = \frac{(6 \times 10^3)(291.6 \times 10^{-6})}{28.5535 \times 10^{-6}} = 61.3 \times 10^3 \text{ N} \]

\[ F = 61.3 \text{ kN} \]
**PROBLEM 4.14**

Knowing that a beam of the cross section shown is bent about a horizontal axis and that the bending moment is 50 kip \( \cdot \) in., determine the total force acting (a) on the top flange, (b) on the shaded portion of the web.

**SOLUTION**

The stress distribution over the entire cross-section is given by the bending stress formula:

\[ \sigma_x = -\frac{My}{I} \]

where \( y \) is a coordinate with its origin on the neutral axis and \( I \) is the moment of inertia of the entire cross sectional area. The force on the shaded portion is calculated from this stress distribution. Over an area element \( dA \), the force is

\[ dF = \sigma_x dA = -\frac{My}{I} dA \]

The total force on the shaded area is then

\[ F = \int dF = -\int \frac{My}{I} dA = -\frac{M}{I} \int ydA = -\frac{M}{I} y^* A^* \]

where \( y^* \) is the centroidal coordinate of the shaded portion and \( A^* \) is its area.

Calculate the moment of inertia.

\[ I = \frac{1}{12} (6 \text{ in.})(7 \text{ in.})^3 - \frac{1}{12} (4 \text{ in.})(4 \text{ in.})^3 = 150.17 \text{ in}^4 \]

\[ M = 50 \text{ kip} \cdot \text{in} \]

(a) **Top flange:**

\[ A^* = (6 \text{ in.})(1.5 \text{ in.}) = 9 \text{ in}^2 \quad y^* = 2 \text{ in.} + 0.75 \text{ in.} = 2.75 \text{ in.} \]

\[ F = \frac{50 \text{ kip} \cdot \text{in}}{150.17 \text{ in}^4} (9 \text{ in}^2)(2.75 \text{ in.}) = 8.24 \text{ kips} \quad F = 8.24 \text{ kips} \]

(b) **Half web:**

\[ A^* = (2 \text{ in.})(2 \text{ in.}) = 4 \text{ in}^2 \quad y^* = 1 \text{ in.} \]

\[ F = \frac{50 \text{ kip} \cdot \text{in}}{150.17 \text{ in}^4} (4 \text{ in}^2)(1 \text{ in.}) = 1.332 \text{ kips} \quad F = 1.332 \text{ kips} \]

PROBLEM 4.21

A steel band saw blade, that was originally straight, passes over 8-in.-diameter pulleys when mounted on a band saw. Determine the maximum stress in the blade, knowing that it is 0.018 in. thick and 0.625 in. wide. Use $E = 29 \times 10^6$ psi.

SOLUTION

Band blade thickness: $t = 0.018$ in.

Radius of pulley: $r = \frac{1}{2}d = 4.000$ in.

Radius of curvature of centerline of blade:

$$\rho = r + \frac{1}{2}t = 4.009 \text{ in.}$$

$$c = \frac{1}{2}t = 0.009 \text{ in.}$$

Maximum strain:

$$\varepsilon_m = \frac{c}{\rho} = \frac{0.009}{4.009} = 0.002245$$

Maximum stress:

$$\sigma_m = E\varepsilon_m = (29 \times 10^6)(0.002245)$$

$\sigma_m = 65.1 \times 10^3$ psi

$\sigma_m = 65.1$ ksi
PROBLEM 4.22

Straight rods of 0.30-in. diameter and 200-ft length are sometimes used to clear underground conduits of obstructions or to thread wires through a new conduit. The rods are made of high-strength steel and, for storage and transportation, are wrapped on spools of 5-ft diameter. Assuming that the yield strength is not exceeded, determine (a) the maximum stress in a rod, when the rod, which is initially straight, is wrapped on a spool, (b) the corresponding bending moment in the rod. Use \( E = 29 \times 10^6 \) psi.

SOLUTION

Radius of cross section: \( r = \frac{1}{2} d = \frac{1}{2}(0.30) = 0.15 \) in.

Moment of inertia: \( I = \frac{\pi}{4} r^4 = \frac{\pi}{4}(0.15)^4 = 397.61 \times 10^{-6} \) in\(^4\)

\[ D = 5 \text{ ft} = 60 \text{ in.} \quad \rho = \frac{1}{2} D = 30 \text{ in.} \]
\[ c = r = 0.15 \text{ in.} \]

(a) \( \sigma_{\text{max}} = \frac{Ec}{\rho} = \frac{(29 \times 10^6)(0.15)}{30} = 145 \times 10^3 \) psi \( \quad \sigma_{\text{max}} = 145 \text{ ksi} \uparrow \)

(b) \( M = \frac{EI}{\rho} = \frac{(29 \times 10^6)(397.61 \times 10^{-6})}{30} \quad M = 384 \text{ lb \cdot in} \uparrow \)
PROBLEM 4.23

A 900-mm strip of steel is bent into a full circle by two couples applied as shown. Determine (a) the maximum thickness $t$ of the strip if the allowable stress of the steel is 420 MPa, (b) the corresponding moment $M$ of the couples. Use $E = 200$ GPa.

SOLUTION

When the rod is bent into a full circle, the circumference is 900 mm. Since the circumference is equal to $2\pi$ times $\rho$, the radius of curvature, we get

$$\rho = \frac{900 \text{ mm}}{2\pi} = 143.24 \text{ mm} = 0.14324 \text{ m}$$

Stress: $\sigma = E\varepsilon = \frac{Ec}{\rho}$ or $c = \frac{\rho\sigma}{E}$

For $\sigma = 420$ MPa and $E = 200$ GPa,

$$c = \frac{(0.14324)(420 \times 10^6)}{200 \times 10^9} = 0.3008 \times 10^{-3} \text{ m}$$

(a) Maximum thickness: $t = 2c = 0.6016 \times 10^{-3} \text{ m}$

$$t = 0.602 \text{ mm}$$

Moment of inertia for a rectangular section.

$$I = \frac{bh^3}{12} = \frac{(8 \times 10^{-3})(0.6016 \times 10^{-3})^3}{12} = 145.16 \times 10^{-15} \text{ m}^4$$

(b) Bending moment: $M = \frac{EI}{\rho}$

$$M = \frac{(200 \times 10^9)(145.16 \times 10^{-15})}{0.14324} = 0.203 \text{ N} \cdot \text{m}$$

$$M = 0.203 \text{ N} \cdot \text{m}$$
PROBLEM 4.24

A 60 N \cdot m couple is applied to the steel bar shown. (a) Assuming that the couple is applied about the z axis as shown, determine the maximum stress and the radius of curvature of the bar. (b) Solve part a, assuming that the couple is applied about the y axis. Use $E = 200 \text{ GPa}$.

\section*{SOLUTION}

\textbf{(a) Bending about z-axis.}

\[ I = \frac{1}{12} bh^3 = \frac{1}{12} (12)(20)^3 = 8 \times 10^3 \text{mm}^4 = 8 \times 10^{-9} \text{m}^4 \]

\[ c = \frac{20}{2} = 10 \text{ mm} = 0.010 \text{ m} \]

\[ \sigma = \frac{Mc}{I} = \frac{(60)(0.010)}{8 \times 10^{-9}} = 75.0 \times 10^6 \text{ Pa} \]

\[ \frac{1}{\rho} = \frac{M}{EI} = \frac{60}{(200 \times 10^9)(8 \times 10^{-9})} = 37.5 \times 10^{-3} \text{ m}^{-1} \]

\[ \sigma = 75.0 \text{ MPa} \]
\[ \rho = 26.7 \text{ m} \]

\textbf{(b) Bending about y-axis.}

\[ I = \frac{1}{12} bh^3 = \frac{1}{12} (20)(12)^3 = 2.88 \times 10^3 \text{mm}^4 = 2.88 \times 10^{-9} \text{m}^4 \]

\[ c = \frac{12}{2} = 6 \text{ mm} = 0.006 \text{ m} \]

\[ \sigma = \frac{Mc}{I} = \frac{(60)(0.006)}{2.88 \times 10^{-9}} = 125.0 \times 10^6 \text{ Pa} \]

\[ \frac{1}{\rho} = \frac{M}{EI} = \frac{60}{(200 \times 10^9)(2.88 \times 10^{-9})} = 104.17 \times 10^{-3} \text{ m}^{-1} \]

\[ \sigma = 125.0 \text{ MPa} \]
\[ \rho = 9.60 \text{ m} \]
PROBLEM 4.25

A couple of magnitude $M$ is applied to a square bar of side $a$. For each of the orientations shown, determine the maximum stress and the curvature of the bar.

SOLUTION

For one triangle, the moment of inertia about its base is

$$ I_1 = \frac{1}{12}bh^3 = \frac{1}{12}a^4 = \frac{a^4}{12} $$

$$ I_2 = I_1 = \frac{a^4}{24} $$

$$ I = I_1 + I_2 = \frac{a^4}{12} $$

$$ c = \frac{a}{\sqrt{2}} $$

$$ \sigma_{\text{max}} = \frac{Mc}{I} = \frac{Ma/\sqrt{2}}{a^4/12} = \frac{6\sqrt{2}M}{a^3} $$

$$ \frac{1}{\rho} = \frac{M}{EI} = \frac{M}{Ea^4/12} $$

$$ \sigma_{\text{max}} = \frac{8.49M}{a^3} $$

$$ \frac{1}{\rho} = \frac{12M}{Ea^4} $$
PROBLEM 4.26

A portion of a square bar is removed by milling so that its cross section is as shown. The bar is then bent about its horizontal axis by a couple \( \mathbf{M} \). Considering the case where \( h = 0.9h_0 \), express the maximum stress in the bar in the form \( \sigma_m = k\sigma_0 \), where \( \sigma_0 \) is the maximum stress that would have occurred if the original square bar had been bent by the same couple \( \mathbf{M} \), and determine the value of \( k \).

SOLUTION

\[
I = 4I_1 + 2I_2 = (4)\left(\frac{1}{12}\right)h h^3 + (2)\left(\frac{1}{3}\right)(2h_0 - 2h)(h^3) = \frac{1}{3}h^4 + \frac{4}{3}h_0 h^3 - \frac{4}{3}h^4 = \frac{4}{3}h_0 h^3 - h^4
\]

\[
c = h
\]

\[
\sigma = \frac{Mc}{I} = \frac{Mh}{\frac{4}{3}h_0 h^3 - h^4} = \frac{3M}{(4h_0 - 3h)h^2}
\]

For the original square, \( h = h_0 \), \( c = h_0 \).

\[
\sigma_0 = \frac{3M}{(4h_0 - 3h_0)h_0^2} = \frac{3M}{h_0^3}
\]

\[
\frac{\sigma}{\sigma_0} = \frac{h_0^3}{(4h_0 - (3)(0.9)h_0)(0.9 h_0^2)} = 0.950

PROBLEM 4.28

A couple M will be applied to a beam of rectangular cross section that is to be sawed from a log of circular cross section. Determine the ratio $d/b$, for which (a) the maximum stress $\sigma_m$ will be as small as possible, (b) the radius of curvature of the beam will be maximum.

SOLUTION

Let $D$ be the diameter of the log.

$$D^2 = b^2 + d^2 \quad d^2 = D^2 - b^2$$

$$I = \frac{1}{12}bd^3 \quad c = \frac{1}{2}d \quad \frac{I}{c} = \frac{1}{6}bd^2$$

(a) $\sigma_m$ is the minimum when $\frac{I}{c}$ is maximum.

$$\frac{d}{db} \left( \frac{I}{c} \right) = \frac{1}{6}D^2 - \frac{3}{6}b^2 = 0 \quad b = \frac{1}{\sqrt{3}}D$$

$$d = \sqrt{D^2 - \frac{1}{3}D^2} = \sqrt{\frac{2}{3}}D$$

$$\frac{d}{b} = \sqrt{2} \blacklozenge$$

(b) $\rho = \frac{E I}{M}$

$\rho$ is maximum when $I$ is maximum, $\frac{1}{12}bd^3$ is maximum, or $b^2d^6$ is maximum.

$$(D^2 - d^2)d^6$$ is maximum.

$$6D^2d^5 - 8d^7 = 0 \quad d = \frac{\sqrt{3}}{2}D$$

$$b = \sqrt{D^2 - \frac{3}{4}D^2} = \frac{1}{2}D$$

$$\frac{d}{b} = \sqrt{3} \blacklozenge$$
PROBLEM 4.29

For the aluminum bar and loading of Sample Prob. 4.1, determine (a) the radius of curvature $\rho'$ of a transverse cross section, (b) the angle between the sides of the bar that were originally vertical. Use $E = 10.6 \times 10^6$ psi and $v = 0.33$.

SOLUTION

From Sample Prob. 4.1, $I = 12.97 \text{ in}^4$  
$M = 103.8 \text{ kip \cdot in}$

$$\frac{1}{\rho} = \frac{M}{EI} = \frac{103.8 \times 10^3}{(10.6 \times 10^6)(12.97)} = 755 \times 10^{-6} \text{ in}^{-1}$$

(a) 
$$\frac{1}{\rho'} = v \frac{1}{\rho} = (0.33)(755 \times 10^{-6}) = 249 \times 10^{-6} \text{ in}^{-1}$$

$$\rho' = 4010 \text{ in.}$$

$$\rho' = 334 \text{ ft}$$

(b)

$$\theta = \frac{\text{length of arc}}{\text{radius}} = \frac{b}{\rho'} = \frac{3.25}{4010} = 810 \times 10^{-6} \text{ rad}$$

$$\theta = 0.0464^\circ$$
PROBLEM 4.30

For the bar and loading of Example 4.01, determine (a) the radius of curvature $\rho$, (b) the radius of curvature $\rho'$ of a transverse cross section, (c) the angle between the sides of the bar that were originally vertical. Use $E = 29 \times 10^6$ psi and $v = 0.29$.

SOLUTION

From Example 4.01, $M = 30 \text{ kip} \cdot \text{in}$, $I = 1.042 \text{ in}^4$

(a) $\frac{1}{\rho} = \frac{M}{EI} = \frac{(30 \times 10^3)}{(29 \times 10^6)(1.042)} = 993 \times 10^{-6} \text{ in}^{-1}$

$\rho = 1007 \text{ in.}$ $\blacklozenge$

(b) $\varepsilon^i = v\varepsilon = \frac{vc}{\rho} = \frac{v}{\rho'}$

$\frac{1}{\rho'} = \frac{1}{\rho} = (0.29)(993 \times 10^{-6}) \text{ in}^{-1} = 288 \times 10^{-6} \text{ in}^{-1}$

$\rho' = 3470 \text{ in.}$ $\blacklozenge$

(c) $\theta = \frac{\text{length of arc}}{\text{radius}} = \frac{b}{\rho'} = \frac{0.8}{3470} = 230 \times 10^{-6} \text{ rad}$

$\theta = 0.01320^\circ$ $\blacklozenge$
PROBLEM 4.31

A W200×31.3 rolled-steel beam is subjected to a couple \( \mathbf{M} \) of moment 45 kN⋅m. Knowing that \( E = 200 \) GPa and \( v = 0.29 \), determine (a) the radius of curvature \( \rho \), (b) the radius of curvature \( \rho' \) of a transverse cross section.

SOLUTION

For W 200×31.3 rolled steel section,

\[
I = 31.4 \times 10^6 \text{ mm}^4 = 31.4 \times 10^{-6} \text{ m}^4
\]

(a) \[
\frac{1}{\rho} = \frac{M}{EI} = \frac{45 \times 10^3}{(200 \times 10^9)(31.4 \times 10^{-6})} = 7.17 \times 10^{-3} \text{ m}^{-1}
\]

\[\rho = 139.6 \text{ m} \uparrow\]

(b) \[
\frac{1}{\rho'} = v \frac{1}{\rho} = (0.29)(7.17 \times 10^{-3}) = 2.07 \times 10^{-3} \text{ m}^{-1}
\]

\[\rho' = 481 \text{ m} \uparrow\]
PROBLEM 4.32

It was assumed in Sec. 4.3 that the normal stresses \( \sigma_y \) in a member in pure bending are negligible. For an initially straight elastic member of rectangular cross section, (a) derive an approximate expression for \( \sigma_y \) as a function of \( y \), (b) show that \( (\sigma_y)_{\text{max}} = -(c/2\rho)(\sigma_x)_{\text{max}} \) and, thus, that \( \sigma_y \) can be neglected in all practical situations. (*Hint:* Consider the free-body diagram of the portion of beam located below the surface of ordinate \( y \) and assume that the distribution of the stress \( \sigma_x \) is still linear.)

SOLUTION

Denote the width of the beam by \( b \) and the length by \( L \).

\[
\theta = \frac{L}{\rho}
\]

Using the free body diagram above, with \( \cos \frac{\theta}{2} = 1 \)

\[
\Sigma F_y = 0: \quad \sigma_y b L + 2 \int_{-c}^{y} \sigma_s b dy \sin \frac{\theta}{2} = 0
\]

\[
\sigma_y = -\frac{2}{L} \sin \frac{\theta}{2} \int_{-c}^{y} \sigma_s dy = -\frac{\theta}{L} \int_{-c}^{y} \sigma_s dy = -\frac{1}{\rho} \int_{-c}^{y} \sigma_s dy
\]

But,

\[
\sigma_y = -(\sigma_s)_{\text{max}} \frac{y}{c}
\]

(a) \( \sigma_y = \frac{(\sigma_s)_{\text{max}} y}{\rho c} \int_{-c}^{y} y dy = \frac{(\sigma_s)_{\text{max}} y^2}{\rho c} \]

The maximum value \( \sigma_y \) occurs at \( y = 0 \).

(b) \( (\sigma_y)_{\text{max}} = \frac{(\sigma_s)_{\text{max}} c^2}{2\rho} = \frac{(\sigma_x)_{\text{max}} c}{2\rho} \)

SOLUTION

Use aluminum as the reference material.

For aluminum, \( n = 1.0 \)

For brass, \( n = \frac{E_b}{E_a} = \frac{105}{70} = 1.5 \)

Values of \( n \) are shown on the sketch.

For the transformed section,

\[
I_1 = \frac{n_1 h_1}{12} \left( B_1^3 - b_1^3 \right) = \frac{1.5}{12} (32)(48^3 - 32^3) = 311.296 \times 10^3 \text{mm}^4
\]

\[
I_2 = \frac{n_2 h_2 b_2^3}{12} = \frac{1.0}{12} (8)(32)^3 = 21.8453 \times 10^3 \text{mm}^4
\]

\[
I_3 = I_2 = 21.8453 \times 10^3 \text{mm}^4
\]

\[
I = I_1 + I_2 + I_3 = 354.99 \times 10^3 \text{mm}^4 = 354.99 \times 10^{-9} \text{m}^4
\]

\[
|\sigma| = \frac{nMy}{I} \quad M = \frac{\sigma I}{ny}

Aluminum:

\[
n = 1.0, \quad |y| = 16 \text{ mm} = 0.016 \text{ m}, \quad \sigma = 100 \times 10^6 \text{ Pa}
\]

\[
M = \frac{(100 \times 10^6)(354.99 \times 10^{-9})}{(1.0)(0.016)} = 2.2187 \times 10^3 \text{ N} \cdot \text{m}
\]

Brass:

\[
n = 1.5, \quad |y| = 24 \text{ mm} = 0.024 \text{ m}, \quad \sigma = 160 \times 10^6 \text{ Pa}
\]

\[

\]

Choose the smaller value.

\[
M = 1.57773 \times 10^3 \text{ N} \cdot \text{m} \quad M = 1.578 \text{ kN} \cdot \text{m}

**SOLUTION**

Use wood as the reference material.

\[ n = \frac{E_s}{E_w} = \frac{29}{2} = 14.5 \text{ in steel} \]

For the transformed section,

\[
\begin{align*}
I_1 &= \frac{n_1}{12} b_1 h_1^3 = \frac{1.0}{12} (3)(10)^3 = 250 \text{ in}^4 \\
I_2 &= \frac{n_2}{12} b_2 h_2^3 = \frac{14.5}{12} \left(\frac{1}{2}\right)(10)^3 = 604.17 \text{ in}^4 \\

\]

\[ |\sigma| = \frac{n M y}{I} \quad \therefore \quad M = \frac{\sigma I}{n y} \]

**Wood:**

\[ n = 1.0, \quad y = 5 \text{ in}, \quad \sigma = 2000 \text{ psi} \]

\[ M = \frac{(2000)(1104.2)}{(1.0)(5)} = 441.7 \times 10^3 \text{ lb} \cdot \text{in} \]

**Steel:**

\[ n = 14.5, \quad y = 5 \text{ in}, \quad \sigma = 22 \text{ ksi} = 22 \times 10^3 \text{ psi} \]

\[ M = \frac{(22 \times 10^3)(1104.2)}{(14.5)(5)} = 335.1 \times 10^3 \text{ lb} \cdot \text{in} \]

Choose the smaller value.

\[ M = 335 \times 10^3 \text{ lb} \cdot \text{in} \quad M = 335 \text{ kip} \cdot \text{in} \]

SOLUTION

Use wood as the reference material.

$n = 1.0$ in wood

$n = E_i/E_w = 29/2 = 14.5$ in steel

For the transformed section,

$I_1 = \frac{n_1 b_1 h_1^3}{12} + n_1 A_1 d_1^2$

$= \frac{14.5}{12} (5) \left(\frac{1}{2}\right)^3 + (14.5)(5) \left(\frac{1}{2}\right)(5.25)^2 = 999.36 \text{ in}^4$

$I_2 = \frac{n_2 b_2 h_2^3}{12} = \frac{1.0}{12} (6)(10)^3 = 500 \text{ in}^4$

$I_3 = I_1 = 999.36 \text{ in}^4$

$I = I_1 + I_2 + I_3 = 2498.7 \text{ in}^4$

$|\sigma| = \frac{n M y}{I}$

$\therefore M = \frac{\sigma I}{ny}$

Wood: $n = 1.0, \quad y = 5 \text{ in}, \quad \sigma = 2000 \text{ psi}$

$M = \frac{(2000)(2499)}{(1.0)(5)} = 999.5 \times 10^3 \text{ lb \cdot in}$

Steel: $n = 14.5, \quad y = 5.5 \text{ in}, \quad \sigma = 22 \text{ ksi} = 22 \times 10^3 \text{ psi}$

$M = \frac{(22 \times 10^3)(2499)}{(14.5)(5.5)} = 689.3 \times 10^3 \text{ lb \cdot in}$

Choose the smaller value. $M = 689 \times 10^3 \text{ lb \cdot in}$ $M = 689 \text{ kip \cdot in}$

\[ I = \frac{1}{3}(300)x^3 + (15.708 \times 10^3)(480 - x)^2 \]

\[ = \frac{1}{3}(300)(177.87)^3 + (15.708 \times 10^3)(302.13)^2 \]

\[ = 1.9966 \times 10^9 \text{ mm}^4 = 1.9966 \times 10^{-3} \text{ m}^4 \]

\[ \sigma = -\frac{nMy}{I} \]

(a) Steel:

\[ y = -302.45 \text{ mm} = -0.30245 \text{ m} \]

\[ \sigma = -\frac{(8.0)(175 \times 10^3)(-0.30245)}{1.9966 \times 10^{-3}} = 212 \times 10^6 \text{ Pa} \]

PROBLEM 4.47

The reinforced concrete beam shown is subjected to a positive bending moment of 175 kN \cdot m. Knowing that the modulus of elasticity is 25 GPa for the concrete and 200 GPa for the steel, determine (a) the stress in the steel, (b) the maximum stress in the concrete.

PROBLEM 4.48

Solve Prob. 4.47, assuming that the 300-mm width is increased to 350 mm.

SOLUTION

\[ n = \frac{E_s}{E_c} = \frac{200 \text{ GPa}}{25 \text{ GPa}} = 8.0 \]

\[ A_s = 4 \frac{\pi}{4} d^2 = (4) \left( \frac{\pi}{4} \right) (25)^2 = 1.9635 \times 10^3 \text{mm}^2 \]

\[ nA_s = 15.708 \times 10^3 \text{mm}^2 \]

Locate the neutral axis:

\[ 350 \frac{x}{2} - (15.708 \times 10^3)(480 - x) = 0 \]

\[ 175x^2 + 15.708 \times 10^3 x - 7.5398 \times 10^6 = 0 \]

Solve for \( x \):

\[ x = \sqrt{\frac{175 \times 10^6 + \sqrt{(175 \times 10^6)^2 + (4)(175)(7.5398 \times 10^6)}}}{2(175)} \]

\[ x = 167.48 \text{ mm}, \quad 480 - x = 312.52 \text{ mm} \]

\[ I = \frac{1}{3} (350)x^3 + (15.708 \times 10^3)(480 - x)^2 \]

\[ = \frac{1}{3} (350)(167.48)^3 + (15.708 \times 10^3)(312.52)^2 \]

\[ = 2.0823 \times 10^9 \text{ mm}^4 = 2.0823 \times 10^{-3} \text{ m}^4 \]

\[ \sigma = -\frac{nMy}{I} \]

(a) Steel:

\[ y = -312.52 \text{ mm} = -0.31252 \text{ m} \]

\[ \sigma = -\frac{(8.0)(175 \times 10^3)(-0.31252)}{2.0823 \times 10^{-3}} = 210 \times 10^6 \text{ Pa} \]

\[ \sigma = 210 \text{ MPa} \]

(b) Concrete:

\[ y = 167.48 \text{ mm} = 0.16748 \text{ m} \]

\[ \sigma = -\frac{(1.0)(175 \times 10^3)(0.16748)}{2.0823 \times 10^{-3}} = -14.08 \times 10^6 \text{ Pa} \]

\[ \sigma = -14.08 \text{ MPa} \]
PROBLEM 4.49

A concrete slab is reinforced by 16-mm-diameter steel rods placed on 180-mm centers as shown. The modulus of elasticity is 20 GPa for concrete and 200 GPa for steel. Using an allowable stress of 9 MPa for the concrete and of 120 MPa for the steel, determine the largest bending moment in a portion of slab 1 m wide.

SOLUTION

\[ n = \frac{E_s}{E_c} = \frac{200 \text{ GPa}}{20 \text{ GPa}} = 10 \]

Consider a section 180-mm wide with one steel rod.

\[ A_s = \frac{\pi}{4} d^2 = \frac{\pi}{4} (16)^2 = 201.06 \text{ mm}^2 \]

\[ nA_s = 2.0106 \times 10^3 \text{ mm}^2 \]

Locate the neutral axis:

\[ 180 \frac{x}{2} - (100 - x)(2.0106 \times 10^3) = 0 \]

\[ 90x^2 + 2.0106 \times 10^3 x - 201.06 \times 10^3 = 0 \]

Solving for \( x \):

\[ x = \frac{-2.0106 \times 10^3 + \sqrt{(2.0106 \times 10^3)^2 + (4)(90)(201.06 \times 10^3)}}{2(90)} \]

\[ x = 37.397 \text{ mm} \quad 100 - x = 62.603 \text{ mm} \]

\[ I = \frac{1}{3} (180)x^2 + (2.0106 \times 10^3)(100 - x)^2 \]

\[ = \frac{1}{3} (180)(37.397)^3 + (2.0106 \times 10^3)(62.603)^2 \]

\[ = 11.018 \times 10^6 \text{ mm}^4 = 11.018 \times 10^{-6} \text{ m}^4 \]

\[ |\sigma| = \frac{nM_y}{I} \]

\[ \therefore M = \frac{\sigma I}{ny} \]

Concrete:

\[ n = 1, \quad y = 37.397 \text{ mm} = 0.037397 \text{ m}, \quad \sigma = 9 \times 10^6 \text{ Pa} \]

\[ M = \frac{(9 \times 10^6)(11.018 \times 10^{-6})}{(1.0)(0.037397)} = 2.6516 \times 10^3 \text{ N} \cdot \text{m} \]
PROBLEM 4.49 (Continued)

Steel: \( n = 10, \ y = 62.603 \text{ mm} = 0.062603 \text{ m}, \ \sigma = 120 \times 10^6 \text{ Pa} \)

\[
M = \frac{(120 \times 10^6)(11.018 \times 10^{-6})}{(10)(0.062603)} = 2.1120 \times 10^3 \text{ N} \cdot \text{m}

Choose the smaller value. \( M = 2.1120 \times 10^3 \text{ N} \cdot \text{m} \)

The above is the allowable positive moment for a 180-mm wide section. For a 1-m = 1000-mm width, multiply by \( \frac{1000}{180} = 5.556 \)

\[
M = (5.556)(2.1120 \times 10^3) = 11.73 \times 10^3 \text{ N} \cdot \text{m} \quad M = 11.73 \text{kN} \cdot \text{m}

Solve Prob. 4.49, assuming that the spacing of the 16-mm-diameter rods is increased to 225 mm on centers.

SOLUTION

\[

\]

\[
112.5x^2 + 2.0106x - 201.06 \times 10^3 = 0

\]

\[
x = 34.273 \text{ mm} \quad 100 - x = 65.727
\]

\[
I = \frac{1}{3}(225)x^3 + 2.0106 \times 10^3(100 - x)^2

SOLUTION

\[

PROBLEM 4.53

The design of a reinforced concrete beam is said to be balanced if the maximum stresses in the steel and concrete are equal, respectively, to the allowable stresses $\sigma_s$ and $\sigma_c$. Show that to achieve a balanced design the distance $x$ from the top of the beam to the neutral axis must be

$$x = \frac{d}{1 + \frac{\sigma_s E_s}{\sigma_c E_c}}$$

where $E_s$ and $E_c$ are the moduli of elasticity of concrete and steel, respectively, and $d$ is the distance from the top of the beam to the reinforcing steel.

SOLUTION

$$\sigma_s = \frac{nM(d-x)}{I} \quad \sigma_c = \frac{Mx}{I}$$

$$\frac{\sigma_s}{\sigma_c} = \frac{n(d-x)}{x} = n \frac{d}{x} - n$$

$$d = 1 + \frac{1}{n} \frac{\sigma_s}{\sigma_c} = 1 + \frac{E_s \sigma_s}{E_c \sigma_c}$$

$$x = \frac{d}{1 + \frac{E_s \sigma_s}{E_c \sigma_c}}$$
PROBLEM 4.54

For the concrete beam shown, the modulus of elasticity is $3.5 \times 10^6$ psi for the concrete and $29 \times 10^6$ psi for the steel. Knowing that $b = 8$ in. and $d = 22$ in., and using an allowable stress of 1800 psi for the concrete and 20 ksi for the steel, determine (a) the required area $A_s$ of the steel reinforcement if the beam is to be balanced, (b) the largest allowable bending moment. (See Prob. 4.53 for definition of a balanced beam.)

The design of a reinforced concrete beam is said to be balanced if the maximum stresses in the steel and concrete are equal, respectively, to the allowable stresses $\sigma_s$ and $\sigma_c$.

SOLUTION

$$n = \frac{E_s}{E_c} = \frac{29 \times 10^6}{3.5 \times 10^6} = 8.2857$$

$$\sigma_s = \frac{nM(d-x)}{I} \quad \sigma_c = \frac{Mx}{I}$$

$$\frac{\sigma_s}{\sigma_c} = \frac{n(d-x)}{x} = \frac{n}{x}$$

$$d = 1 + \frac{1}{n} \sigma_s = 1 + \frac{1}{8.2857} \frac{20 \times 10^3}{1800} = 2.3410$$

$$x = 0.42717d = (0.42717)(22) = 9.398 \text{ in.} \quad d - x = 22 - 9.398 = 12.602 \text{ in.}$$

Locate neutral axis: $bx + nA_s(d-x) = 0$

$$A_s = \frac{bx^2}{2n(d-x)} = \frac{(8)(9.398)^2}{(2)(8.2857)(12.602)} = 3.3835 \text{ in}^2$$

$$I = \frac{1}{3} bx^3 + nA_s(d-x)^2 = \frac{1}{3} (8)(9.398)^3 + (8.2857)(3.3835)(12.602)^2 = 6665.6 \text{ in}^4$$

$$\sigma = \frac{nMy}{I} \quad M = \sigma I$$

(a) $A_s = 3.38 \text{ in}^2$

(b) Concrete: $n = 1.0 \quad y = 9.398 \text{ in.} \quad \sigma_c = 1800 \text{ psi} \quad M = \frac{(1800)(6665.6)}{(1.0)(9.398)} = 1.277 \times 10^6 \text{ lb} \cdot \text{in}$

Steel: $n = 8.2857 \quad |y| = 12.602 \text{ in.} \quad \sigma_s = 20 \times 10^3 \text{ psi}$

$$M = \frac{(20 \times 10^3)(6665.6)}{(8.2857)(12.602)} = 1.277 \times 10^6 \text{ lb} \cdot \text{in}$$

Note that both values are the same for balanced design. $M = 106.4 \text{ kip} \cdot \text{ft}$
**PROBLEM 4.55**

Five metal strips, each 40 mm wide, are bonded together to form the composite beam shown. The modulus of elasticity is 210 GPa for the steel, 105 GPa for the brass, and 70 GPa for the aluminum. Knowing that the beam is bent about a horizontal axis by a couple of moment 1800 N \cdot m, determine (a) the maximum stress in each of the three metals, (b) the radius of curvature of the composite beam.

**SOLUTION**

Use aluminum as the reference material.

- $n = 1$ in aluminum.
- $n = E_s / E_a = 210 / 70 = 3$ in steel.
- $n = E_h / E_a = 105 / 70 = 1.5$ in brass.

Due to symmetry of both the material arrangement and the geometry, the neutral axis passes through the center of the steel portion.

For the transformed section,

  \[
  \sigma_b = \frac{(1.5)(1800)(0.020)}{866.66 \times 10^{-9}} = 62.3 \times 10^6 \text{ Pa} \\
  \sigma_b = 62.3 \text{ MPa} \uparrow
\]

- Steel: $n = 3.0$, $y = -10 \text{ mm} = -0.010 \text{ m}$
  \[
  \sigma_s = \frac{(3.0)(1800)(0.010)}{866.66 \times 10^{-9}} = 62.3 \times 10^6 \text{ Pa} \\
  \sigma_s = 62.3 \text{ MPa} \uparrow
\]

(b) Radius of curvature, $\rho = \frac{M}{E_a I} = \frac{1800}{(70 \times 10^9)(866.66 \times 10^{-9})} = 0.02967 \text{ m}^{-1}$

$\rho = 33.7 \text{ m} \uparrow$

(a) \[\sigma = -\frac{n M y}{I}\] where \( M = 1800 \text{ N} \cdot \text{m} \)

Aluminum: \( n = 1, \quad y = -10 \text{ mm} = -0.010 \text{ m} \)

\[\sigma_a = \frac{(1.0)(1800)(0.010)}{1.3467 \times 10^{-6}} = 13.37 \times 10^6 \text{ Pa} \] \[\sigma_a = 13.37 \text{ MPa} \]

Brass: \( n = 1.5, \quad y = -30 \text{ mm} = -0.030 \text{ m} \)

\[\sigma_b = \frac{(1.5)(1800)(0.030)}{1.3467 \times 10^{-6}} = 60.1 \times 10^6 \text{ Pa} \] \[\sigma_b = 60.1 \text{ MPa} \]

Steel: \( n = 3.0, \quad y = -20 \text{ mm} = -0.020 \text{ m} \)

\[\sigma_s = \frac{(3.0)(1800)(0.020)}{1.3467 \times 10^{-6}} = 80.1 \times 10^6 \text{ Pa} \] \[\sigma_s = 80.1 \text{ MPa} \]

(b) Radius of curvature. \[\rho = \frac{M}{E_a I} = \frac{1800}{(70 \times 10^9)(1.3467 \times 10^{-6})} = 0.01909 \text{ m}^{-1} \]

\[\rho = 52.4 \text{ m} \]
PROBLEM 4.57

The composite beam shown is formed by bonding together a brass rod and an aluminum rod of semicircular cross sections. The modulus of elasticity is $15 \times 10^6$ psi for the brass and $10 \times 10^6$ psi for the aluminum. Knowing that the composite beam is bent about a horizontal axis by couples of moment $8$ kip \cdot in., determine the maximum stress $(a)$ in the brass, $(b)$ in the aluminum.

SOLUTION

For each semicircle, \( r = 0.8 \) in. \( A = \frac{\pi}{2} r^2 = 1.00531 \text{ in}^2 \),

\[
\bar{y}_o = \frac{4r}{3\pi} = \frac{(4)(0.8)}{3\pi} = 0.33953 \text{ in.} \quad \bar{I}_{\text{base}} = \frac{\pi}{8} r^4 = 0.160850 \text{ in}^4
\]

\[
\bar{T} = \bar{I}_{\text{base}} - n A \bar{y}_o^2 = 0.160850 - (1.00531)(0.33953)^2 = 0.044953 \text{ in}^4
\]

Use aluminum as the reference material.

\[
n = 1.0 \text{ in aluminum} \quad n = \frac{E_b}{E_a} = \frac{15 \times 10^6}{10 \times 10^6} = 1.5 \text{ in brass}
\]

Locate the neutral axis.

\[
\begin{array}{|c|c|c|c|c|}
\hline
& A, \text{ in}^2 & nA, \text{ in}^2 & \bar{y}_o, \text{ in.} & nA\bar{y}_o, \text{ in}^3 \\
\hline
\text{1} & 1.00531 & 1.50796 & 0.33953 & 0.51200 \\
\text{2} & 1.00531 & 1.00531 & -0.33953 & -0.34133 \\
\hline
\Sigma & 2.51327 & & 0.17067 & \\
\hline
\end{array}
\]

\( d_1 = 0.33953 - 0.06791 = 0.27162 \text{ in.} \), \( d_2 = 0.33953 + 0.06791 = 0.40744 \text{ in.} \)

\( I_1 = n_1\bar{T} + n_1 A d_1^2 = (1.5)(0.044957) + (1.5)(1.00531)(0.27162)^2 = 0.17869 \text{ in}^4 \)

\( I_2 = n_2\bar{T} + n_2 A d_2^2 = (1.0)(0.044957) + (1.0)(1.00531)(0.40744)^2 = 0.21185 \text{ in}^4 \)

\( I = I_1 + I_2 = 0.39054 \text{ in}^4 \)

\((a)\) Brass: \( n = 1.5, \quad y = 0.8 - 0.06791 = 0.73209 \text{ in.} \)

\[
\sigma = -\frac{nMy}{I} = -\frac{(1.5)(8)(0.73209)}{0.39054} = -22.5 \text{ ksi}
\]

\((b)\) Aluminium: \( n = 1.0, \quad y = -0.8 - 0.06791 = -0.86791 \text{ in.} \)

\[
\sigma = -\frac{nMy}{I} = -\frac{(1.0)(8)(-0.86791)}{0.39054} = 17.78 \text{ ksi}
\]
PROBLEM 4.58

A steel pipe and an aluminum pipe are securely bonded together to form the composite beam shown. The modulus of elasticity is 200 GPa for the steel and 70 GPa for the aluminum. Knowing that the composite beam is bent by a couple of moment 500 N · m, determine the maximum stress (a) in the aluminum, (b) in the steel.

SOLUTION

Use aluminum as the reference material.

\[ n = 1.0 \text{ in aluminum} \]
\[ n = \frac{E_s}{E_a} = \frac{200}{70} = 2.857 \text{ in steel} \]

For the transformed section,

Steel: \[ I_s = n_s \frac{\pi}{4} (r_o^4 - r_i^4) = (2.857) \left( \frac{\pi}{4} \right) (16^4 - 10^4) = 124.62 \times 10^3 \text{ mm}^4 \]

Aluminum: \[ I_a = n_a \frac{\pi}{4} (r_o^4 - r_i^4) = (1.0) \left( \frac{\pi}{4} \right) (19^4 - 16^4) = 50.88 \times 10^3 \text{ mm}^4 \]

\[ I = I_s + I_a = 175.50 \times 10^3 \text{ mm}^4 = 175.5 \times 10^{-9} \text{ m}^4 \]

(a) Aluminum:

\[ c = 19 \text{ mm} = 0.019 \text{ m} \]
\[ \sigma_a = \frac{n_a Mc}{I} = \frac{(1.0)(500)(0.019)}{175.5 \times 10^{-9}} = 54.1 \times 10^6 \text{ Pa} \]

\[ \sigma_a = 54.1 \text{ MPa} \]

(b) Steel:

\[ c = 16 \text{ mm} = 0.016 \text{ m} \]
\[ \sigma_s = \frac{n_s Mc}{I} = \frac{(2.857)(500)(0.016)}{175.5 \times 10^{-9}} = 130.2 \times 10^6 \text{ Pa} \]

\[ \sigma_s = 130.2 \text{ MPa} \]

**SOLUTION**

\[
\begin{align*}
n &= \frac{1}{2} \quad \text{on the tension side of neutral axis.} \\
n &= 1 \quad \text{on the compression side.}
\end{align*}
\]

Locate neutral axis.

\[
\begin{align*}
n_1 b x - n_2 b (h - x) \frac{h - x}{2} &= 0 \\
\frac{1}{2} b x^2 - \frac{1}{4} b (h - x)^2 &= 0 \\
x^2 &= \frac{1}{2} (h - x)^2 \\
x &= \frac{1}{\sqrt{2} + 1} h = 0.41421 h = 41.421 \text{ mm}
\end{align*}
\]

\( h - x = 58.579 \text{ mm} \)

\[
\begin{align*}
I_1 &= n_1 \frac{1}{3} b x^3 = \left( \frac{1}{3} \right) (50)(41.421)^3 = 1.1844 \times 10^6 \text{ mm}^4 \\
I_2 &= n_2 \frac{1}{3} b (h - x)^3 = \left( \frac{1}{2} \right) \left( \frac{1}{3} \right) (50)(58.579)^3 = 1.6751 \times 10^6 \text{ mm}^4 \\
I &= I_1 + I_2 = 2.8595 \times 10^6 \text{ mm}^4 = 2.8595 \times 10^{-6} \text{ m}^4
\end{align*}
\]

\((a)\) Tensile stress:

\[
\sigma = -\frac{n M y}{I} = -\frac{(0.5)(600)(-0.058579)}{2.8595 \times 10^{-6}} = 6.15 \times 10^6 \text{ Pa} \quad \sigma_t = 6.15 \text{ MPa}
\]

\((b)\) Compressive stress:

\[
\sigma = -\frac{n M y}{I} = -\frac{(1.0)(600)(0.041421)}{2.8595 \times 10^{-6}} = -8.69 \times 10^6 \text{ Pa} \quad \sigma_c = -8.69 \text{ MPa}

PROBLEM 4.60*

A rectangular beam is made of material for which the modulus of elasticity is $E_t$ in tension and $E_c$ in compression. Show that the curvature of the beam in pure bending is

$$\frac{1}{\rho} = \frac{M}{E_t I}$$

where

$$E_r = \frac{4E_t E_c}{(\sqrt{E_c} + \sqrt{E_t})^2}$$

SOLUTION

Use $E_t$ as the reference modulus.

Then $E_c = nE_t$.

Locate neutral axis.

$$nbx - h(h - x) = 0$$
$$nx^2 - (h-x)^2 = 0$$
$$x = \frac{h}{\sqrt{n} + 1}$$
$$h - x = \frac{\sqrt{nh}}{\sqrt{n} + 1}$$

$$I_{trans} = \frac{n}{3} b h^3 + \frac{1}{3} b (h-x)^3 = \left[ \frac{h}{3} \left( \frac{1}{\sqrt{n} + 1} \right)^3 + \left( \frac{\sqrt{n}}{\sqrt{n} + 1} \right)^3 \right] bh^3$$

$$= \frac{n + n^{3/2}}{3} \left( \frac{1}{\sqrt{n} + 1} \right)^3 bh^3 = \frac{n}{3} \left( \frac{1 + \sqrt{n}}{\sqrt{n} + 1} \right)^3 bh^3 = \frac{n}{3} \left( \frac{1}{\sqrt{n} + 1} \right)^2 bh^3$$

$$\frac{1}{\rho} = \frac{M}{E_t I_{trans}} = \frac{M}{E_t I}$$

where $I = \frac{1}{12} bh^3$

$$E_r I = E_t I_{trans}$$

$$E_r = \frac{E_t I_{trans}}{I} = \frac{12}{bh^3} \times E_t \times \frac{n}{3(\sqrt{n} + 1)^2} bh^3$$

$$= \frac{4E_t E_c / E_t}{(\sqrt{E_c} / E_t + 1)^2} = \frac{4E_t E_c}{(\sqrt{E_c} + \sqrt{E_t})^2}$$

SOLUTION

(a) \( d = D - 2r = 108 - (2)(9) = 90 \text{ mm} \)

\[ \frac{D}{d} = \frac{108}{90} = 1.20 \quad \frac{r}{d} = \frac{9}{90} = 0.1 \]

From Fig. 4.32, \( K = 2.07 \)

The prismatic bar shown, made of a steel that is assumed to be elastoplastic with $E = 29 \times 10^6$ psi and $\sigma_Y = 36$ ksi, is subjected to a couple of 1350 lb·in. parallel to the z axis. Determine (a) the thickness of the elastic core, (b) the radius of curvature of the bar.

**SOLUTION**

(a) \[ I = \frac{1}{12} \left( \frac{1}{2} \right) \left( \frac{5}{8} \right)^3 = 10.1725 \times 10^{-3} \text{ in}^4 \]
\[ c = \frac{1}{2} \left( \frac{5}{8} \right) = 0.3125 \text{ in.} \]
\[ M_Y = \frac{\sigma_Y I}{c} = \frac{(36 \times 10^3)(10.1725 \times 10^{-3})}{0.3125} = 1171.872 \text{ lb·in} \]
\[ M = \frac{3}{2} M_Y \left[ 1 - \frac{1}{3} \left( \frac{y_Y}{c} \right)^3 \right] \]
\[ y_Y = \sqrt{3 - \frac{2M}{M_Y}} = \sqrt{3 - \frac{(2)(1350)}{1171.872}} = 0.83426 \]
\[ y_Y = (0.83426)(0.3125) = 0.26071 \text{ in.} \]

Thickness of elastic core:
\[ 2y_Y = 0.521 \text{ in.} \]

(b) \[ y_Y = \varepsilon_Y \rho = \frac{\sigma_Y}{E} \rho \]
\[ \rho = \frac{y_Y E}{\sigma_Y} = \frac{(0.26071)(29 \times 10^6)}{36 \times 10^3} = 210.02 \text{ in.} \]
\[ \rho = 17.50 \text{ ft} \]
PROBLEM 4.70
Solve Prob. 4.69, assuming that the 1350-lb·in. couple is parallel to the y axis.

PROBLEM 4.69
The prismatic bar shown, made of a steel that is assumed to be elastoplastic with $E = 29 \times 10^6$ psi and $\sigma_Y = 36$ ksi, is subjected to a couple of 1350 lb·in parallel to the z axis. Determine (a) the thickness of the elastic core, (b) the radius of curvature of the bar.

SOLUTION

(a) $I = \frac{1}{12} \left( \frac{5}{8} \right) \left( \frac{1}{2} \right)^3 = 6.5104 \times 10^{-3} \text{ in}^4$

$c = \left( \frac{1}{2} \right) \left( \frac{1}{2} \right) = 0.25 \text{ in.}$

$M_Y = \frac{\sigma_Y I}{c} = \frac{(36 \times 10^3)(6.5104 \times 10^{-3})}{0.25} = 937.5 \text{ lb·in}$

$M = \frac{3}{2} \left[ 1 - \frac{1}{3} \left( \frac{y_Y}{c} \right)^2 \right]$

$\frac{y_Y}{c} = \sqrt{3 \left( \frac{2}{M_Y} \right) - 1} = \sqrt{\frac{3 - (2)(1350)}{937.5}} = 0.34641$

$y_Y = (0.34641)(0.25) = 0.086603 \text{ in.}$

Thickness of elastic core: $2y_Y = 0.1732 \text{ in.}$

(b) $y_Y = \varepsilon_Y \rho = \frac{\sigma_Y}{E} \rho$

$\rho = \frac{y_Y E}{\sigma_Y} = \frac{(0.086603)(29 \times 10^6)}{36 \times 10^3} = 69.763 \text{ in.}$

$\rho = 5.81 \text{ ft}$
A bar of rectangular cross section shown is made of a steel that is assumed to be elastoplastic with $E = 200 \text{ GPa}$ and $\sigma_y = 300 \text{ MPa}$. Determine the bending moment $M$ for which (a) yield first occurs, (b) the plastic zones at the top and bottom of the bar are 12 mm thick.

**SOLUTION**

$$I = \frac{1}{12}(30)(40)^3 = 160 \times 10^3 \text{ mm}^4 = 160 \times 10^{-9} \text{ m}^4$$

$$c = \frac{1}{2}(40) = 20 \text{ mm} = 0.020 \text{ m}$$

(a) First yielding: 
$$\sigma = \frac{Mc}{I} = \sigma_y$$

$$M_y = \frac{I\sigma_y}{c} = \frac{(160)(10^{-9})(300 \times 10^6)}{0.020} = 2400 \text{ N} \cdot \text{m}$$

$$M_y = 2.40 \text{ kN} \cdot \text{m}$$

(b) Plastic zones are 12 mm thick:
$$y_y = 20 \text{ mm} - 12 \text{ mm} = 8 \text{ mm}$$

$$\frac{y_y}{c} = \frac{8 \text{ mm}}{20 \text{ mm}} = 0.4$$

$$M = \frac{3}{2}M_y \left[ 1 - \frac{1}{3} \left( \frac{y_y}{c} \right)^2 \right]$$

$$= \frac{3}{2}(2400) \left[ 1 - \frac{1}{3} (0.4)^2 \right] = 3408 \text{ N} \cdot \text{m}$$

$$M = 3.41 \text{ kN} \cdot \text{m}$$
PROBLEM 4.72

Bar $AB$ is made of a steel that is assumed to be elastoplastic with $E = 200$ GPa and $\sigma_y = 240$ MPa. Determine the bending moment $M$ for which the radius of curvature of the bar will be $(a)$ 18 m, $(b)$ 9 m.

SOLUTION

$I = \frac{1}{12} (30)(40)^3 = 160 \times 10^3 \text{ mm}^4 = 160 \times 10^{-9} \text{ m}^4$

$c = \frac{1}{2} (40) = 20 \text{ mm} = 0.020 \text{ m}$

$M_y = \frac{I\sigma_y}{c} = \frac{(160 \times 10^{-9})(240 \times 10^6)}{0.020} = 1920 \text{ N} \cdot \text{m}$

$\frac{1}{\rho_y} = \frac{M_y}{EI} = \frac{1920}{(200 \times 10^9)(160 \times 10^{-9})} = 0.0600 \text{ m}^{-1}$

$(a) \quad \rho = 18 \text{ m}: \quad \frac{1}{\rho} = 0.05556 \text{ m}^{-1} < 0.0600 \text{ m}^{-1}$

The bar is fully elastic.

$M = \frac{EI}{\rho} = \frac{(200 \times 10^9)(160 \times 10^{-9})}{18} = 1778 \text{ N} \cdot \text{m}$

$M = 1.778 \text{ kN} \cdot \text{m}$

$(b) \quad \rho = 9 \text{ m}: \quad \frac{1}{\rho} = 0.11111 \text{ m}^{-1} > 0.0600 \text{ m}^{-1}$

The bar is partially plastic.

$\sigma_y = \frac{Ey_y}{\rho} \quad y_y = \frac{\rho\sigma_y}{E}$

$y_y = \frac{(9)(240 \times 10^6)}{200 \times 10^9} = 0.0108 \text{ m} = 10.8 \text{ mm}$

$\frac{y_y}{c} = \frac{10.8 \text{ mm}}{20 \text{ mm}} = 0.54$

$M = \frac{3}{2} M_y \left[1 - \frac{1}{3} \left(\frac{y_y}{c}\right)^2\right] = \frac{3}{2} (1920) \left[1 - \frac{1}{3} (0.54)^2\right] = 2600 \text{ N} \cdot \text{m}$

$M = 2.60 \text{ kN} \cdot \text{m}$

A beam of the cross section shown is made of a steel that is assumed to be elastoplastic with \( E = 200 \text{ GPa} \) and \( \sigma_y = 240 \text{ MPa} \). For bending about the \( z \)-axis, determine the bending moment at which \((a)\) yield first occurs, \((b)\) the plastic zones at the top and bottom of the bar are 30-mm thick.

SOLUTION

\((a)\)

\[ I = \frac{1}{12}bh^3 = \frac{1}{12}(60)(90)^3 = 3.645 \times 10^6 \text{ mm}^4 = 3.645 \times 10^{-6} \text{ m}^4 \]

\[ c = \frac{1}{2}h = 45 \text{ mm} = 0.045 \text{ m} \]

\[ M_y = \frac{\sigma_y I}{c} = \frac{(240 \times 10^6)(3.645 \times 10^{-6})}{0.045} = 19.44 \times 10^3 \text{ N} \cdot \text{m} \]

\[ M_y = 19.44 \text{ kN} \cdot \text{m} \]

\[ R_1 = \sigma_y A_1 = (240 \times 10^6)(0.060)(0.030) \]

\[ = 432 \times 10^3 \text{ N} \]

\[ y_1 = 15 \text{ mm} + 15 \text{ mm} = 0.030 \text{ m} \]

\[ R_2 = \frac{1}{2} \sigma_y A_2 = \left(\frac{1}{2}\right)(240 \times 10^6)(0.060)(0.015) \]

\[ = 108 \times 10^3 \text{ N} \]

\[ y_2 = \frac{2}{3}(15 \text{ mm}) = 10 \text{ mm} = 0.010 \text{ m} \]

\[(b)\]

\[ M = 2(R_1y_1 + R_2y_2) = 2[(432 \times 10^3)(0.030) + (108 \times 10^3)(0.010)] \]

\[ = 28.08 \times 10^3 \text{ N} \cdot \text{m} \]

\[ M = 28.1 \text{ kN} \cdot \text{m} \]

**PROBLEM 4.74**

A beam of the cross section shown is made of a steel that is assumed to be elastoplastic with $E = 200$ GPa and $\sigma_y = 240$ MPa. For bending about the $z$ axis, determine the bending moment at which (a) yield first occurs, (b) the plastic zones at the top and bottom of the bar are 30-mm thick.

**SOLUTION**

(a) $I_{rect} = \frac{1}{12}bh^3 = \frac{1}{12}(60)(90)^3 = 3.645 \times 10^6$ mm$^4$

$I_{cutout} = \frac{1}{12}bh^3 = \frac{1}{12}(30)(30)^3 = 67.5 \times 10^3$ mm$^4$

$I = 3.645 \times 10^6 - 67.5 \times 10^3 = 3.5775 \times 10^6$ mm$^4$

$c = \frac{1}{2}h = 45 \text{ mm} = 0.045 \text{ m}$

$M_y = \frac{\sigma_y I}{c} = \frac{(240 \times 10^6)(3.5775 \times 10^{-6})}{0.045}$

$= 19.08 \times 10^3 \text{ N} \cdot \text{m}$

$M_y = 19.08 \text{ kN} \cdot \text{m}$

(b) $M = 2(R_1 y_1 + R_2 y_2)$

$= 2[(432 \times 10^3)(0.030) + (54 \times 10^3)(0.015)]$

$= 27.00 \times 10^3 \text{ N} \cdot \text{m}$

$M = 27.0 \text{ kN} \cdot \text{m}$

PROBLEM 4.77

For the beam indicated (of Prob. 4.73), determine (a) the fully plastic moment \( M_p \), (b) the shape factor of the cross section.

SOLUTION

From Problem 4.73, \( E = 200 \) GPa and \( \sigma_y = 240 \) MPa.

\[ A_t = (60)(45) = 2700 \text{ mm}^2 \]
\[ = 2700 \times 10^{-6} \text{ m}^2 \]
\[ R = \sigma_y A_t \]
\[ = (240 \times 10^6)(2700 \times 10^{-6}) \]
\[ = 648 \times 10^3 \text{ N} \]
\[ d = 45 \text{ mm} = 0.045 \text{ m} \]

(a) \( M_p = Rd = (648 \times 10^3)(0.045) = 29.16 \times 10^3 \text{ N} \cdot \text{m} \)

\[ M_p = 29.2 \text{ kN} \cdot \text{m} \]

(b) \[ I = \frac{1}{12}bh^3 = \frac{1}{12}(60)(90)^3 = 3.645 \times 10^6 \text{ mm}^4 = 3.645 \times 10^{-6} \text{ m}^4 \]

SOLUTION

From Problem 4.74, \( E = 200 \text{ GPa} \) and \( \sigma_f = 240 \text{ MPa} \).

(a) \( R_1 = \sigma_f A_1 \)

\[

\[ y_1 = 1.5 + 1.5 = 3.0 \text{ in.} \]
\( R_2 = \sigma_f A_2 = (42)(3)(1.5) = 189 \) kip
\[ y_2 = \frac{1}{2}(1.5) = 0.75 \text{ in.} \]
\[ M_p = 2(R_1y_1 + R_2y_2) = 2[(756)(3.0) + (189)(0.75)] \]

PROBLEM 4.80

For the beam indicated (of Prob. 4.76), determine (a) the fully plastic moment $M_p$, (b) the shape factor of the cross section.

SOLUTION

From Problem 4.76, $E = 29 \times 10^6$ psi and $\sigma_y = 42$ ksi.

(a) $R_1 = \sigma_y A_1 = (42)(3)(3) = 378$ kip

$y_1 = 1.5 + 1.5 = 3.0$ in.

$R_2 = \sigma_y A_2 = (42)(6)(1.5) = 378$ kip

$y_2 = \frac{1}{2}(1.5) = 0.75$ in.

$M_p = 2(R_1 y_1 + R_2 y_2) = 2[(378)(3.0) + (378)(0.75)]$

$M_p = 2835 \text{ kip} \cdot \text{in}$

(b) $I_1 = \frac{1}{12} b h_1^3 + A_d d_1^2 = \frac{1}{12} (3)(3)^3 + (3)(3)^2 = 87.75 \text{ in}^4$

$I_2 = \frac{1}{12} b_2 h_2^3 = \frac{1}{12} (6)(3)^3 = 13.5 \text{ in}^4$

$I_3 = I_1 = 87.75 \text{ in}^4$

$I = I_1 + I_2 + I_3 = 188.5 \text{ in}^4$

$c = 4.5$ in.

$M_Y = \frac{\sigma_y I}{c} = \frac{(42)(188.5)}{4.5} = 1759.3 \text{ kip} \cdot \text{in}$

$k = \frac{M_p}{M_Y} = \frac{2835}{1759.3} = 1.611$

SOLUTION

For a semicircle:

PROBLEM 4.83

Determine the plastic moment \( M_p \) of a steel beam of the cross section shown, assuming the steel to be elastoplastic with a yield strength of 240 MPa.

SOLUTION

Total area: \( A = \frac{1}{2} (30)(36) = 540 \text{ mm}^2 \)

Half area: \( \frac{1}{2} A = 270 \text{ mm}^2 = A_1 \)

By similar triangles, \( \frac{b}{y} = \frac{30}{36} \Rightarrow b = \frac{5}{6} y \)

Since \( A_i = \frac{1}{2} b y = \frac{5}{12} y^2 \), \( y^2 = \frac{12}{5} A_i \)

\( y = \sqrt{\frac{12}{5}} (270) = 25.4558 \text{ mm} \)

\( b = 21.2132 \text{ mm} \)

\( A_i = \frac{1}{2} (21.2132)(25.4558) = 270 \text{ mm}^2 = 270\times10^{-6} \text{ m}^2 \)

\( A_2 = (21.2132)(36 - 25.4558) = 223.676 \text{ mm}^2 = 223.676\times10^{-6} \text{ m}^2 \)

\( A_3 = A - A_i - A_2 = 46.324 \text{ mm}^2 = 46.324\times10^{-6} \text{ m}^2 \)

\( R_i = \sigma_y A_i = 240\times10^6 A_i \)

\( R_1 = 64.8\times10^3 \text{ N}, \quad R_2 = 53.6822\times10^3 \text{ N}, \quad R_3 = 11.1178\times10^3 \text{ N} \)

\( \bar{y}_1 = \frac{1}{3} y = 8.4853 \text{ mm} = 8.4853\times10^{-3} \text{ m} \)

\( \bar{y}_2 = \frac{1}{2} (36 - 25.4558) = 5.2721 \text{ mm} = 5.2721\times10^{-3} \text{ m} \)

\( \bar{y}_3 = \frac{2}{3} (36 - 25.4558) = 7.0295 \text{ mm} = 7.0295\times10^{-3} \text{ m} \)

\( M_p = R_1 \bar{y}_1 + R_2 \bar{y}_2 + R_3 \bar{y}_3 = 911 \text{ N} \cdot \text{m} \) \( M_p = 911 \text{ N} \cdot \text{m} \)
PROBLEM 4.84

Determine the plastic moment $M_p$ of a steel beam of the cross section shown, assuming the steel to be elastoplastic with a yield strength of 240 MPa.

SOLUTION

Let $c_1$ be the outer radius and $c_2$ the inner radius.

$$A_1\bar{y}_1 = A_a\bar{y}_a - A_b\bar{y}_b$$

$$= \left( \frac{\pi}{2} c_1^2 \right) \left( \frac{4c_1}{3\pi} \right) - \left( \frac{\pi}{2} c_2^2 \right) \left( \frac{4c_2}{3\pi} \right)$$

$$= \frac{2}{3} (c_1^3 - c_2^3)$$

$$A_2\bar{y}_2 = A_a\bar{y}_1 = \frac{2}{3} (c_1^3 - c_2^2)$$

$$M_p = \sigma_y (A_1\bar{y}_1 + A_2\bar{y}_2) = \frac{4}{3} \sigma_y \left( c_1^3 - c_2^3 \right)$$

Data:

$\sigma_y = 240 \text{ MPa} = 240 \times 10^6 \text{ Pa}$

$c_1 = 60 \text{ mm} = 0.060 \text{ m}$

$c_2 = 40 \text{ mm} = 0.040 \text{ m}$

$$M_p = \frac{4}{3} \left( 240 \times 10^6 \right) \left( 0.060^3 - 0.040^3 \right)$$

$$= 48.64 \times 10^3 \text{ N} \cdot \text{ m} \quad M_p = 48.6 \text{ kN} \cdot \text{ m}$$
PROBLEM 4.85

Determine the plastic moment $M_p$ of the cross section shown, assuming the steel to be elastoplastic with a yield strength of 36 ksi.

SOLUTION

Total area:

$$A = (1.8)(0.4) + (0.6)(1.2) = 1.44 \text{ in}^2$$

$$\frac{1}{2} A = 0.72 \text{ in}^2$$

$$x = \frac{\frac{1}{2} A}{b} = \frac{0.72}{0.6} = 1.2 \text{ in.}$$

Neutral axis lies 1.2 in. below the top.

$$A_1 = \frac{1}{2} A = 0.72 \text{ in}^2, \quad \bar{y}_1 = \frac{1}{2}(1.2) = 0.6 \text{ in.}$$

$$A_2 = \frac{1}{2} A = 0.72 \text{ in}^2, \quad \bar{y}_2 = \frac{1}{2}(0.4) = 0.2 \text{ in.}$$

$$M_p = \sigma_y (A_1 \bar{y}_1 + A_2 \bar{y}_2)$$

$$= (36)(0.72)(0.6) + (0.72)(0.2)) = 20.7 \text{ kip} \cdot \text{in}$$

$$M_p = 20.7 \text{ kip} \cdot \text{in}$$
PROBLEM 4.86

Determine the plastic moment $M_p$ of the cross section shown, assuming the steel to be elastoplastic with a yield strength of 36 ksi.

SOLUTION

Total area:

$$A = (4) \left( \frac{1}{2} \right) + \left( \frac{1}{2} \right)(3) + (2) \left( \frac{1}{2} \right) = 4.5 \text{ in}^2$$

$$\frac{1}{2} A = 2.25 \text{ in}^2$$

$A_1 = 2.00 \text{ in}^2$, $\bar{y}_1 = 0.75$, $A_1y_1 = 1.50 \text{ in}^3$

$A_2 = 0.25 \text{ in}^2$, $\bar{y}_2 = 0.25$, $A_2y_2 = 0.0625 \text{ in}^3$

$A_3 = 1.25 \text{ in}^2$, $\bar{y}_3 = 1.25$, $A_3y_3 = 1.5625 \text{ in}^3$

$A_4 = 1.00 \text{ in}^2$, $\bar{y}_4 = 2.75$, $A_4y_4 = 2.75 \text{ in}^3$

$M_p = \sigma_y \left( A_1\bar{y}_1 + A_2\bar{y}_2 + A_3\bar{y}_3 + A_4\bar{y}_4 \right)$

$$= (36)(1.50 + 0.0625 + 1.5625 + 2.75)$$

$$M_p = 212 \text{ kip} \cdot \text{in}$$

SOLUTION

\[ M_p = 27.54 \times 10^3 \text{ N} \cdot \text{m} \]  

(See solutions to Problems 4.74 and 4.78.)

\[ I = 3.5775 \times 10^{-6} \text{ m}^4, \quad c = 0.045 \text{ m} \]

\[ \sigma' = \frac{M_{\text{max}} y}{I} = \frac{M_p c}{I} \quad \text{at} \quad y = c \]

\[ \sigma' = \left( \frac{27.54 \times 10^3 \times 0.045}{3.5775 \times 10^{-6}} \right) = 346.4 \times 10^6 \text{ Pa} \]

\[ \sigma_{\text{res}} = \sigma' - \sigma_y = 346.4 \times 10^6 - 240 \times 10^6 = 106.4 \times 10^6 \text{ Pa} \]

See solution to Problem 4.75 for bending couple and stress distribution.

\[ M = 4725 \text{ kip} \cdot \text{in} \quad y_g = 1.5 \text{ in.} \quad E = 29 \times 10^6 \text{ psi} = 29 \times 10^3 \text{ ksi} \]

\[ \sigma_y = 42 \text{ ksi} \quad I = 357.75 \text{ in}^4 \quad c = 4.5 \text{ in.} \]

(a) \[ \sigma' = \frac{M_c}{I} = \frac{(4725)(4.5)}{357.75} = 59.43 \text{ ksi} \]

\[ \sigma'' = \frac{M_y}{I} = \frac{(4725)(1.5)}{357.75} = 19.81 \text{ ksi} \]

At \( y = c \), \( \sigma_{res} = \sigma' - \sigma_y = 59.43 - 42 = 17.43 \text{ ksi} \)

At \( y = y_g \), \( \sigma_{res} = \sigma'' - \sigma_y = 19.81 - 42 = -22.19 \text{ ksi} \)

\sigma_y = 42 \text{ ksi} \quad I = 188.5 \text{ in}^4 \quad c = 4.5 \text{ in.}
\]

(a) \[
\sigma' = \frac{Mc}{I} = \frac{(2646)(4.5)}{188.5} = 63.17 \text{ ksi} \\
\sigma'' = \frac{My_y}{I} = \frac{(2646)(1.5)}{188.5} = 21.06 \text{ ksi}

A bending couple is applied to the beam of Prob. 4.73, causing plastic zones 30 mm thick to develop at the top and bottom of the beam. After the couple has been removed, determine (a) the residual stress at \( y = 45 \) mm, (b) the points where the residual stress is zero, (c) the radius of curvature corresponding to the permanent deformation of the beam.

SOLUTION

See solution to Problem 4.73 for bending couple and stress distribution during loading:

\[
M = 28.08 \times 10^3 \text{ N} \cdot \text{m} \quad y_y = 15 \text{ mm} = 0.015 \text{ m} \quad E = 200 \text{ GPa}
\]

\[
\sigma_y = 240 \text{ MPa} \quad I = 3.645 \times 10^{-6} \text{ m}^4 \quad c = 0.045 \text{ m}
\]

(a) \[
\sigma' = \frac{Mc}{I} = \frac{(28.08 \times 10^3)(0.045)}{3.645 \times 10^{-6}} = 346.7 \times 10^6 \text{ Pa} = 346.7 \text{ MPa}
\]

\[
\sigma'' = \frac{M y_y}{I} = \frac{(28.08 \times 10^3)(0.015)}{3.645 \times 10^{-6}} = 115.6 \times 10^6 \text{ Pa} = 115.6 \text{ MPa}
\]

At \( y = c \), \( \sigma_{\text{res}} = \sigma' - \sigma_y = 346.7 - 240 \)

\[\sigma_{\text{res}} = 106.7 \text{ MPa}\]

At \( y = y_y \), \( \sigma_{\text{res}} = \sigma'' - \sigma_y = 115.6 - 240 \)

\[\sigma_{\text{res}} = -124.4 \text{ MPa}\]

(b) \( \sigma_{\text{res}} = 0 \) \implies \frac{M y_0}{I} - \sigma_y = 0

\[y_0 = \frac{I \sigma_y}{M} = \frac{(3.645 \times 10^{-6})(240 \times 10^6)}{28.08 \times 10^3} = 31.15 \times 10^{-3} \text{ m} = 31.15 \text{ mm}\]

Answer: \( y_0 = -31.15 \text{ mm}, 0, 31.15 \text{ mm}\)

(c) At \( y = y_y \), \( \sigma_{\text{res}} = -124.4 \times 10^6 \text{ Pa} \)

A beam of the cross section shown is made of a steel that is assumed to be elastoplastic with \( E = 29 \times 10^6 \) psi and \( \sigma_y = 42 \) ksi. A bending couple is applied to the beam about \( z \) axis, causing plastic zones 2 in. thick to develop at the top and bottom of the beam. After the couple has been removed, determine (a) the residual stress at \( y = 2 \) in., (b) the points where the residual stress is zero, (c) the radius of curvature corresponding to the permanent deformation of the beam.

SOLUTION

See solution to Problem 4.76 for bending couple and stress distribution during loading.

\]

(a) \[\sigma' = \frac{Mc}{I} = \frac{(406)(2)}{14.6667} = 55.36 \text{ ksi} \]

\[\sigma'' = \frac{My_y}{I} = \frac{(406)(1.0)}{14.6667} = 27.68 \text{ ksi} \]

At \( y = c \), \( \sigma_{\text{res}} = \sigma' - \sigma_y = 55.36 - 42 \)

\( \sigma_{\text{res}} = 13.36 \text{ ksi} \)

At \( y = y_y \), \( \sigma_{\text{res}} = \sigma'' - \sigma_y = 27.68 - 42 \)

\( \sigma_{\text{res}} = -14.32 \text{ ksi} \)

(b) \( \sigma_{\text{res}} = 0 \) \[\therefore \frac{M y_0}{I} - \sigma_y = 0 \]

**PROBLEM 4.93**

A rectangular bar that is straight and unstressed is bent into an arc of circle of radius by two couples of moment \( M \). After the couples are removed, it is observed that the radius of curvature of the bar is \( \rho_R \). Denoting by \( \rho_Y \) the radius of curvature of the bar at the onset of yield, show that the radii of curvature satisfy the following relation:

\[
\frac{1}{\rho_R} = \frac{1}{\rho} \left\{ 1 - \frac{3}{2} \frac{\rho}{\rho_Y} \left[ 1 - \frac{1}{3} \left( \frac{\rho}{\rho_Y} \right)^2 \right] \right\}
\]

**SOLUTION**

\[
\frac{1}{\rho} = \frac{M_Y}{EI}, \quad M = \frac{3}{2} M_Y \left( 1 - \frac{1}{3} \frac{\rho^2}{\rho_Y^2} \right),
\]

Let \( m \) denote \( \frac{M}{M_Y} \):

\[
m = \frac{M}{M_Y} = \frac{3}{2} \left( 1 - \frac{\rho^2}{\rho_Y^2} \right) \quad \therefore \quad \frac{\rho^2}{\rho_Y^2} = 3 - 2 m
\]

\[
\frac{1}{\rho} = \frac{1}{\rho} - \frac{M}{EI} = \frac{1}{\rho} - \frac{mM_Y}{EI} = \frac{1}{\rho} - \frac{m}{\rho_Y}
\]

\[
= \frac{1}{\rho} \left\{ 1 - \frac{\rho}{\rho_Y} m \right\} = \frac{1}{\rho} \left\{ 1 - \frac{3}{2} \frac{\rho}{\rho_Y} \left[ 1 - \frac{1}{3} \left( \frac{\rho}{\rho_Y} \right)^2 \right] \right\}

A solid bar of rectangular cross section is made of a material that is assumed to be elastoplastic. Denoting by \( M_Y \) and \( \rho_Y \), respectively, the bending moment and radius of curvature at the onset of yield, determine (a) the radius of curvature when a couple of moment \( M = 1.25M_Y \) is applied to the bar, (b) the radius of curvature after the couple is removed. Check the results obtained by using the relation derived in Prob. 4.93.

SOLUTION

(a) \[ \frac{1}{\rho_Y} = \frac{M_Y}{EI}, \quad M = \frac{3}{2}M_Y \left(1 - \frac{1}{3} \frac{\rho^2}{\rho_Y^2}\right) \]

Let \( m = \frac{M}{M_Y} = 1.25 \)

\[ m = \frac{M}{M_Y} = \frac{3}{2} \left(1 - \frac{1}{3} \frac{\rho^2}{\rho_Y^2}\right) \quad \frac{\rho}{\rho_Y} = \sqrt{3 - 2m} = 0.70711 \]

\[ \rho = 0.70711\rho_Y \]

(b) \[ \frac{1}{\rho_R} = \frac{1}{\rho} - \frac{M}{EI} = \frac{1}{\rho} - \frac{mM_Y}{EI} = \frac{1}{\rho} - \frac{m}{\rho_Y} = \frac{1}{\rho_Y} - \frac{1.25}{\rho_Y} \]

$J = \frac{\Delta u}{3} \Sigma w u |\sigma|$

where $w$ is a weighting factor.

Using $\Delta u = 0.25$, we get the values given in the table below:

PROBLEM 4.97

The prismatic bar $AB$ is made of a bronze alloy for which the tensile stress-strain diagram is as shown. Assuming that the $\sigma - \varepsilon$ diagram is the same in compression as in tension, determine (a) the maximum stress in the bar when the radius of curvature of the bar is 100 in., (b) the corresponding value of the bending moment. (See hint given in Prob. 4.96.)

SOLUTION

(a) $\rho = 100$ in., $b = 0.8$ in., $c = 0.6$ in.

$\varepsilon_m = \frac{c}{\rho} = \frac{0.6}{100} = 0.006$

From the curve, $\sigma_m = 43$ ksi

(b) Strain distribution: $\varepsilon = -\varepsilon_m \frac{y}{c} = -\varepsilon_m u$ where $u = \frac{y}{\varepsilon}$

Bending couple:

$M = -\int_{-c}^{c} y \sigma \, dy = 2b \int_{0}^{c} y \left| \sigma \right| \, dy = 2bc^2 \int_{0}^{1} u \left| \sigma \right| \, du = 2bc^2 J$

where the integral $J$ is given by

$J = \int_{0}^{1} u \left| \sigma \right| \, du$

Evaluate $J$ using a method of numerical integration. If Simpson’s rule is used, the integration formula is

$J = \frac{\Delta u}{3} \sum w_{u} |\sigma|$

where $w_{u}$ is a weighting factor.

Using $\Delta u = 0.25$, we get the values given the table below:

| $u$ | $|\varepsilon|$ | $|\sigma|$, ksi | $u \, |\sigma|$, ksi | $w$ | $w_{u} \, |\sigma|$, ksi |
|-----|----------------|----------------|-----------------|-----|------------------|
| 0   | 0              | 0              | 0               | 1   | 0                |
| 0.25| 0.0015         | 25             | 6.25            | 4   | 25               |
| 0.5 | 0.003          | 36             | 18              | 2   | 36               |
| 0.75| 0.0045         | 40             | 30              | 4   | 120              |
| 1.00| 0.006          | 43             | 43              | 1   | 43               |

$\sum w_{u} |\sigma| = 224$

PROBLEM 4.98

A prismatic bar of rectangular cross section is made of an alloy for which the stress-strain diagram can be represented by the relation \( \varepsilon = k\sigma^n \) for \( \sigma > 0 \) and \( \varepsilon = -k\sigma^n \) for \( \sigma < 0 \). If a couple \( M \) is applied to the bar, show that the maximum stress is

\[
\sigma_m = \frac{1 + 2n\frac{Mc}{nI}}{3n}\frac{1}{I}
\]

SOLUTION

Strain distribution:

\[
\varepsilon = -\varepsilon_m \frac{y}{c} = -\varepsilon_m u \quad \text{where} \quad u = \frac{y}{c}
\]

Bending couple:

\[
M = -\int_{-c}^{c} y \sigma bdy = 2b \int_{0}^{c} \frac{y}{c} |\sigma|dy = 2bc^2 \left[ \int_{0}^{c} \frac{y}{c} |\sigma| \right] dy
\]

\[
= 2bc^2 \int_{0}^{1} u |\sigma| \ du
\]

For

\[
\varepsilon = K\sigma^n, \quad \varepsilon_m = K\sigma_m
\]

then

\[
\frac{\varepsilon}{\varepsilon_m} = u = \left( \frac{\sigma}{\sigma_m} \right)^n \quad \therefore |\sigma| = \sigma_m \frac{1}{u^n}
\]

Then

\[
M = 2bc^2 \int_{0}^{1} u \sigma_m \frac{1}{u^n} \ du = 2bc^2 \sigma_m \int_{0}^{1} u^{1+\frac{1}{n}} \ du
\]

\[
= 2bc^2 \sigma_m \frac{u^{2+\frac{1}{n}}}{2+\frac{1}{n}} \bigg|_{0}^{1} = \frac{2n}{2n+1} \ bc^2 \sigma_m
\]

\[
\sigma_m = \frac{2n+1}{2} \frac{M}{bc^2}
\]

Recall: that

\[
\frac{I}{c} = \frac{1}{12} \frac{bc^3}{c} = \frac{2}{3} \ bc^2 \quad \therefore \frac{1}{bc^2} = \frac{2}{3} \ \frac{c}{I}
\]

Then

\[
\sigma_m = \frac{2n+1}{3n} \frac{Mc}{I}
\]

A short wooden post supports a 6-kip axial load as shown. Determine the stress at point A when (a) \( b = 0 \), (b) \( b = 1.5 \text{ in.} \), (c) \( b = 3 \text{ in.} \).

SOLUTION

\[ A = \pi r^2 = \pi (3)^2 = 28.27 \text{ in}^2 \]
\[ I = \frac{\pi}{4} r^4 = \frac{\pi}{4} (3)^4 = 63.62 \text{ in}^4 \]
\[ S = \frac{I}{c} = \frac{63.62}{3} = 21.206 \text{ in}^3 \]
\[ P = 6 \text{ kips} \quad M = Pb \]

(a) \( b = 0 \quad M = 0 \)
\[ \sigma = -\frac{P}{A} = -\frac{6}{28.27} = -0.212 \text{ ksi} \]
\[ \sigma = -212 \text{ psi} \]

(b) \( b = 1.5 \text{ in.} \quad M = (6)(1.5) = 9 \text{ kip} \cdot \text{in} \)
\[ \sigma = -\frac{P}{A} - \frac{M}{S} = -\frac{6}{28.27} - \frac{9}{21.206} = -0.637 \text{ ksi} \]
\[ \sigma = -637 \text{ psi} \]

(c) \( b = 3 \text{ in.} \quad M = (6)(3) = 18 \text{ kip} \cdot \text{in} \)
\[ \sigma = -\frac{P}{A} - \frac{M}{S} = -\frac{6}{28.27} - \frac{18}{21.206} = -1.061 \text{ ksi} \]
\[ \sigma = -1061 \text{ psi} \]

PROBLEM 4.101

Knowing that the magnitude of the horizontal force $P$ is 8 kN, determine the stress at (a) point $A$, (b) point $B$.

SOLUTION

$$A = (30)(24) = 720 \text{ mm}^2 = 720 \times 10^{-6} \text{ m}^2$$

$$e = 45 - 12 = 33 \text{ mm} = 0.033 \text{ m}$$

$$I = \frac{1}{12}bh^3 = \frac{1}{12}(30)(24)^3 = 34.56 \times 10^3 \text{ mm}^4 = 34.56 \times 10^{-9} \text{ m}^4$$

$$c = \frac{1}{2}(24 \text{ mm}) = 12 \text{ mm} = 0.012 \text{ m} \quad P = 8 \times 10^3 \text{ N}$$

$$M = Pe = (8 \times 10^3)(0.033) = 264 \text{ N} \cdot \text{m}$$

(a) \[\sigma_A = -\frac{P}{A} \frac{Mc}{I} = -\frac{8 \times 10^3}{720 \times 10^{-6}} - \frac{(264)(0.012)}{34.56 \times 10^{-9}} = -102.8 \times 10^6 \text{ Pa} \]

\[\sigma_A = -102.8 \text{ MPa} \]

(b) \[\sigma_B = -\frac{P}{A} + \frac{Mc}{I} = -\frac{8 \times 10^3}{720 \times 10^{-6}} + \frac{(264)(0.012)}{34.56 \times 10^{-9}} = 80.6 \times 10^6 \text{ Pa} \]

SOLUTION

Rectangular cutout is \( 60 \text{ mm} \times 40 \text{ mm} \).

\[
A = (80)(60) - (60)(40) = 2.4 \times 10^3 \text{ mm}^2 = 2.4 \times 10^{-3} \text{ m}^2
\]

\[

\]

\[
M = Pe = (20 \times 10^3)(0.240) = 4.8 \times 10^3 \text{ N} \cdot \text{ m}

PROBLEM 4.104

Determine the stress at points $A$ and $B$, (a) for the loading shown, (b) if the 60-kN loads are applied at points 1 and 2 only.

**SOLUTION**

(a) Loading is centric.

\[ P = 180 \text{kN} = 180 \times 10^3 \text{ N} \]
\[ A = (90)(240) = 21.6 \times 10^3 \text{ mm}^2 = 21.6 \times 10^{-6} \text{ m}^2 \]

At $A$ and $B$:

\[ \sigma = \frac{P}{A} = \frac{180 \times 10^3}{21.6 \times 10^{-6}} = -8.33 \times 10^6 \text{ Pa} \]

\[ \sigma_A = \sigma_B = -8.33 \text{ MPa} \]

(b) Eccentric loading.

\[ P = 120 \text{kN} = 120 \times 10^3 \text{ N} \]
\[ M = (60 \times 10^3)(150 \times 10^{-3}) = 9.0 \times 10^3 \text{ N} \cdot \text{m} \]
\[ I = \frac{1}{12}bh^3 = \frac{1}{12}(90)(240)^3 = 103.68 \times 10^6 \text{ mm}^4 = 103.68 \times 10^{-6} \text{ m}^4 \]
\[ c = 120 \text{ mm} = 0.120 \text{ m} \]

At $A$:

\[ \sigma_A = \frac{P}{A} - \frac{Mc}{I} = -\frac{120 \times 10^3}{21.6 \times 10^{-6}} - \frac{(9.0 \times 10^3)(0.120)}{103.68 \times 10^{-6}} = -15.97 \times 10^6 \text{ Pa} \]

At $B$:

PROBLEM 4.107

The four forces shown are applied to a rigid plate supported by a solid steel post of radius \( a \). Knowing that \( P = 100 \) kN and \( a = 40 \) mm, determine the maximum stress in the post when (a) the force at \( D \) is removed, (b) the forces at \( C \) and \( D \) are removed.

SOLUTION

For a solid circular section of radius \( a \),

\[
A = \pi a^2 \quad I = \frac{\pi a^4}{4}
\]

Centric force:

\[
F = 4P, \quad M_x = M_z = 0 \quad \sigma = -\frac{F}{A} = -\frac{4P}{\pi a^2}
\]

(a) Force at \( D \) is removed:

\[
F = 3P, \quad M_x = -Pa, \quad M_z = 0
\]

\[
\sigma = -\frac{F}{A} - \frac{M_x}{I} = -\frac{3P}{\pi a^2} - \frac{(-Pa)(-a)}{\frac{\pi a^2}{4}} = -\frac{7P}{\pi a^2}
\]

(b) Forces at \( C \) and \( D \) are removed:

\[
F = 2P, \quad M_x = -Pa, \quad M_z = -Pa
\]

Resultant bending couple:

\[
M = \sqrt{M_x^2 + M_z^2} = \sqrt{2} Pa
\]

\[
\sigma = -\frac{F}{A} - \frac{Mc}{I} = -\frac{2P}{\pi a^2} - \frac{\sqrt{2} Pa a}{\frac{\pi a^2}{4}} = -\frac{2 + 4\sqrt{2}}{\pi} \frac{P}{a^2} = -2.437 \frac{P}{a^2}
\]

Numerical data:

\[
P = 100 \times 10^3 \text{ N}, \quad a = 0.040 \text{ m}

(a) \( \sigma = -\frac{(7)(100 \times 10^3)}{\pi (0.040)^2} = -139.3 \times 10^6 \text{ Pa} \quad \sigma = -139.3 \text{ MPa} \)

(b) \( \sigma = -\frac{(2.437)(100 \times 10^3)}{(0.040)^2} = -152.3 \times 10^6 \text{ Pa} \quad \sigma = -152.3 \text{ MPa} \)

SOLUTION

\[ A = ad, \quad I = \frac{1}{12} ad^3, \quad c = \frac{1}{2} d \]

\[ e = \frac{a - d}{2} \]

Data:

$\sigma = 135 \times 10^6$ Pa

PROBLEM 4.110

A short column is made by nailing two 1 × 4-in. planks to a 2 × 4-in. timber. Determine the largest compressive stress created in the column by a 12-kip load applied as shown in the center of the top section of the timber if (a) the column is as described, (b) plank 1 is removed, (c) both planks are removed.

SOLUTION

(a) Centric loading: 4 in. × 4 in. cross section  
\[ A = (4)(4) = 16 \text{ in}^2 \]

\[ \sigma = -\frac{P}{A} = -\frac{12}{16} \]

\[ \sigma = -0.75 \text{ ksi} \]

(b) Eccentric loading: 4 in. × 3 in. cross section  
\[ A = (4)(3) = 12 \text{ in}^2 \]

\[ c = \left(\frac{1}{2}\right)(3) = 1.5 \text{ in.} \]

\[ e = 1.5 - 1.0 = 0.5 \text{ in.} \]

\[ I = \frac{1}{12}bh^3 = \frac{1}{12}(4)(3)^3 = 9 \text{ in}^4 \]

\[ \sigma = -\frac{P}{A} - \frac{Pe}{I} = -\frac{12}{12} - \frac{(12)(0.5)(1.5)}{9} \]

\[ \sigma = -2.00 \text{ ksi} \]

(c) Centric loading: 4 in. × 2 in. cross section  
\[ A = (4)(2) = 8 \text{ in}^2 \]

\[ \sigma = -\frac{P}{A} = -\frac{12}{8} \]

\[ \sigma = -1.50 \text{ ksi} \]
PROBLEM 4.111

An offset \( h \) must be introduced into a solid circular rod of diameter \( d \). Knowing that the maximum stress after the offset is introduced must not exceed 5 times the stress in the rod when it is straight, determine the largest offset that can be used.

SOLUTION

For centric loading,
\[ \sigma_c = \frac{P}{A} \]

For eccentric loading,
\[ \sigma_e = \frac{P}{A} + \frac{Phc}{I} \]

Given
\[ \sigma_e = 5 \sigma_c \]

\[ \frac{P}{A} + \frac{Phc}{I} = 5 \frac{P}{A} \]

\[ \frac{Phc}{I} = 4 \frac{P}{A} \]

\[ h = \frac{4I}{cA} = \frac{4}{d} \left( \frac{\pi d^4}{64} \right) = \frac{1}{2} \]

\[ h = 0.500d \]

\[ \downarrow \]
PROBLEM 4.112

An offset $h$ must be introduced into a metal tube of 0.75-in. outer diameter and 0.08-in. wall thickness. Knowing that the maximum stress after the offset is introduced must not exceed 4 times the stress in the tube when it is straight, determine the largest offset that can be used.

SOLUTION

$$c = \frac{1}{2}d = 0.375 \text{ in.}$$

$$c_t = c - t = 0.375 - 0.08 = 0.295 \text{ in.}$$

$$A = \pi(c^2 - c_t^2) = \pi(0.375^2 - 0.295^2)$$

$$= 0.168389 \text{ in}^2$$

$$I = \frac{\pi}{4}(c^4 - c_t^4) = \frac{\pi}{4}(0.375^4 - 0.295^4)$$

$$= 9.5835 \times 10^{-3} \text{ in}^4$$

For centric loading,

$$\sigma_{cen} = \frac{P}{A}$$

For eccentric loading,

$$\sigma_{ecc} = \frac{P}{A} + \frac{Phc}{I}$$

$$\sigma_{ecc} = 4\sigma_{cen} \text{ or } \frac{P}{A} + \frac{Phc}{I} = 4\frac{P}{A}$$

$$\frac{hc}{I} = \frac{3}{A} h = \frac{3I}{Ac} = \frac{(3)(9.5835 \times 10^{-3})}{(0.168389)(0.375)} \quad h = 0.455 \text{ in.}$$
PROBLEM 4.113

A steel rod is welded to a steel plate to form the machine element shown. Knowing that the allowable stress is 135 MPa, determine (a) the largest force $P$ that can be applied to the element, (b) the corresponding location of the neutral axis. Given: The centroid of the cross section is at $C$ and $I_z = 4195 \, \text{mm}^4$.

SOLUTION

(a) $A = (3)(18) + \frac{\pi}{4}(6)^2 = 82.27 \, \text{mm}^2 = 82.27 \times 10^{-6} \, \text{m}^2$

$I = 4195 \, \text{mm}^4 = 4195 \times 10^{-12} \, \text{m}^4$

$e = 13.12 \, \text{mm} = 0.01312 \, \text{m}$

Based on tensile stress at $y = -13.12 \, \text{mm} = -0.01312 \, \text{m}$

$$\sigma = \frac{P}{A} + \frac{Pe e}{I} = \left(\frac{1}{A} + \frac{e c}{I}\right)P = KP$$

$$K = \frac{1}{A} + \frac{e c}{I} = \frac{1}{82.27 \times 10^{-6}} + \frac{(0.01312)(0.01312)}{4195 \times 10^{-12}} = 53.188 \times 10^3 \, \text{m}^{-2}$$

$$P = \frac{\sigma}{K} = \frac{135 \times 10^6}{53.188 \times 10^3} = 2.538 \times 10^3 \, \text{N}$$

$P = 2.54 \, \text{kN}$

(b) Location of neutral axis. $\sigma = 0$

$$\sigma = \frac{P}{A} - \frac{My}{I} = \frac{P}{A} - \frac{Pey}{I} = 0$$

$$\frac{ey}{I} = \frac{1}{A}$$

$$y = \frac{I}{Ae} = \frac{4195 \times 10^{-12}}{(82.27 \times 10^{-6})(0.01312)} = 3.89 \times 10^{-3} \, \text{m}$$

$y = 3.89 \, \text{mm}$

The neutral axis lies 3.89 mm to the right of the centroid or 17.01 mm to the right of the line of action of the loads.

PROBLEM 4.116

Three steel plates, each of 25 × 150-mm cross section, are welded together to form a short H-shaped column. Later, for architectural reasons, a 25-mm strip is removed from each side of one of the flanges. Knowing that the load remains centric with respect to the original cross section, and that the allowable stress is 100 MPa, determine the largest force \( P \) (a) that could be applied to the original column, (b) that can be applied to the modified column.

SOLUTION

(a) Centric loading:

\[
\sigma = -\frac{P}{A} \\
A = (3)(150)(25) = 11.25 \times 10^3 \text{ mm}^2 = 11.25 \times 10^{-3} \text{ m}^2 \\
P = -\sigma A = -(100 \times 10^6)(11.25 \times 10^{-3}) \\
= 1.125 \times 10^6 \text{ N} \\
\therefore P = 1125 \text{ kN} \]

(b) Eccentric loading (reduced cross section):

\[
\begin{align*}
\Sigma & A, 10^3 \text{ mm}^2 & \bar{y}, \text{ mm} & A\bar{y} (10^3 \text{ mm}^3) & d, \text{ mm} \\
\hline
1 & 3.75 & 87.5 & 328.125 & 76.5625 \\
2 & 3.75 & 0 & 0 & 10.9375 \\
3 & 2.50 & -87.5 & -218.75 & 98.4375 \\
\hline
\Sigma & 10.00 & & 109.375 & \\
\hline

\]

\[
\bar{y} = \frac{\Sigma A\bar{y}}{\Sigma A} = \frac{109.375 \times 10^3}{10.00 \times 10^3} = 10.9375 \text{ mm}

Knowing that the clamp shown has been tightened until $P = 400$ N, determine (a) the stress at point $A$, (b) the stress at point $B$, (c) the location of the neutral axis of section $a-a$.

SOLUTION

Cross section: Rectangle ⊙ + Circle ⊙

1. **Calculate areas and centroids**
   - $A_1 = (20 \text{ mm})(4 \text{ mm}) = 80 \text{ mm}^2$
   - $y_1 = \frac{1}{2}(20 \text{ mm}) = 10 \text{ mm}$
   - $A_2 = \pi(2 \text{ mm})^2 = 4\pi \text{ mm}^2$
   - $y_2 = 20 - 2 = 18 \text{ mm}$

2. **Calculate the location of the neutral axis**
   - $c_B = \bar{y} = \frac{\sum A_i y_i}{\sum A_i} = \frac{(80)(10) + (4\pi)(18)}{80 + 4\pi} = 11.086 \text{ mm}$
   - $c_A = 20 - \bar{y} = 8.914 \text{ mm}$
   - $d_1 = 11.086 - 10 = 1.086 \text{ mm}$
   - $d_2 = 18 - 11.086 = 6.914 \text{ mm}$

3. **Calculate the moments of inertia**
   - $I_1 = I_1 + A_1d_1^2 = \frac{1}{12}(4)(20)^3 + (80)(1.086)^2 = 2.761 \times 10^3 \text{ mm}^4$
   - $I_2 = I_2 + A_2d_2^2 = \frac{\pi}{4}(2)^4 + (4\pi)(6.914)^2 = 0.613 \times 10^3 \text{ mm}^4$
   - $I = I_1 + I_2 = 3.374 \times 10^3 \text{ mm}^4 = 3.374 \times 10^{-9} \text{ m}^4$

PROBLEM 4.120

The four bars shown have the same cross-sectional area. For the given loadings, show that 
(a) the maximum compressive stresses are in the ratio 4:5:7:9, 
(b) the maximum tensile stresses are in the ratio 2:3:5:3.
(Note: the cross section of the triangular bar is an equilateral triangle.)

SOLUTION

Stresses:

At A,

$$\sigma_A = \frac{P}{A} - \frac{P \text{ec}_{A}}{I} = \frac{P}{A} \left(1 + \frac{A \text{ec}_{A}}{I}\right)$$

At B,

$$\sigma_B = \frac{P}{A} + \frac{P \text{ ec}_{B}}{I} = \frac{P}{A} \left(\frac{A \text{ ec}_{B}}{I} - 1\right)$$

\begin{align*}
A_1 &= a^2, \quad I_1 = \frac{1}{12}a^4, \quad c_A = c_B = \frac{1}{2}a, \quad e = \frac{1}{2}a \\

\sigma_B &= \frac{P}{A} \left(\frac{1}{12}a^2 - 1\right)

\begin{align*}
A_2 &= \frac{\pi c^2}{4} = a^2 \quad : \quad c = \frac{a}{\sqrt{\pi}}, \quad I_2 = \frac{\pi}{4} c^4, \quad e = c \\
\sigma_A &= \frac{P}{A_2} \left(1 + \frac{(\pi c^2)(c)(c)}{\frac{\pi}{4} c^4}\right) \\
\sigma_B &= \frac{P}{A_2} \left(\frac{(\pi c^2)(c)(c)}{\frac{\pi}{4} c^4} - 1\right)

PROBLEM 4.121

The C-shaped steel bar is used as a dynamometer to determine the magnitude $P$ of the forces shown. Knowing that the cross section of the bar is a square of side 40 mm and that strain on the inner edge was measured and found to be 450 μ, determine the magnitude $P$ of the forces. Use $E = 200$ GPa.

SOLUTION

At the strain gage location,

$$\sigma = E \varepsilon = (200 \times 10^9)(450 \times 10^{-6}) = 90 \times 10^6 \text{ Pa}$$

$$A = (40)(40) = 1600 \text{ mm}^2 = 1600 \times 10^{-6} \text{ m}^2$$

$$I = \frac{1}{12} (40)(40)^3 = 213.33 \times 10^3 \text{ mm}^4 = 213.33 \times 10^{-9} \text{ m}^4$$

$$e = 80 + 20 = 100 \text{ mm} = 0.100 \text{ m}$$

$$c = 20 \text{ mm} = 0.020 \text{ m}$$

$$\sigma = \frac{P}{A} + \frac{Mc}{I} = \frac{P}{A} + \frac{Pec}{I} = KP$$

$$K = \frac{1}{A} + \frac{ec}{I} = \frac{1}{1600 \times 10^{-6}} + \frac{(0.100)(0.020)}{213.33 \times 10^{-9}} = 10.00 \times 10^3 \text{ m}^{-2}$$

$$P = \frac{\sigma}{K} = \frac{90 \times 10^6}{10.00 \times 10^3} = 9.00 \times 10^3 \text{ N} \quad P = 9.00 \text{ kN}$$
PROBLEM 4.122

An eccentric force \( P \) is applied as shown to a steel bar of 25\( \times \)90-mm cross section. The strains at \( A \) and \( B \) have been measured and found to be

\[
e_A = +350 \mu \quad e_B = -70 \mu
\]

Knowing that \( E = 200 \text{ GPa} \), determine (a) the distance \( d \), (b) the magnitude of the force \( P \).

SOLUTION

\[
h = 15 + 45 + 30 = 90 \text{ mm} \quad b = 25 \text{ mm} \quad c = \frac{1}{2} h = 45 \text{ mm} = 0.045 \text{ m}
\]

\[
A = bh - (25)(90) = 2.25 \times 10^3 \text{ mm}^2 = 2.25 \times 10^{-3} \text{ m}^2
\]

\[
I = \frac{1}{12} bh^3 = \frac{1}{12} (25)(90)^3 = 1.51875 \times 10^6 \text{ mm}^4 = 1.51875 \times 10^{-6} \text{ m}^4
\]

\[
y_A = 60 - 45 = 15 \text{ mm} = 0.015 \text{ m} \quad y_B = 15 - 45 = -30 \text{ mm} = -0.030 \text{ m}
\]

Stresses from strain gages at \( A \) and \( B \):

\[
\sigma_A = Ee_A = (200 \times 10^9)(350 \times 10^{-6}) = 70 \times 10^6 \text{ Pa}
\]

\[
\sigma_B = Ee_B = (200 \times 10^9)(-70 \times 10^{-6}) = -14 \times 10^6 \text{ Pa}
\]

\[
\sigma_A = \frac{P}{A} - \frac{My_A}{I} \quad (1)
\]

\[
\sigma_B = \frac{P}{A} - \frac{My_B}{I} \quad (2)
\]

Subtracting,

\[
\sigma_A - \sigma_B = \frac{M(y_A - y_B)}{I}
\]

\[
M = \frac{I(\sigma_A - \sigma_B)}{y_A - y_B} = \frac{1.51875 \times 10^{-6}(84 \times 10^6)}{0.045} = -2835 \text{ N} \cdot \text{m}
\]

Multiplying (2) by \( y_A \) and (1) by \( y_B \) and subtracting,

\[
y_A\sigma_B - y_B\sigma_A = (y_A - y_B)\frac{P}{A}
\]

\[
P = \frac{A(y_A\sigma_B - y_B\sigma_A)}{y_A - y_B} = \frac{(2.25 \times 10^{-3})[(0.015)(-14 \times 10^6) - (-0.030)(70 \times 10^6)]}{0.045} = 94.5 \times 10^3 \text{ N}
\]

\[
(a) \quad M = -Pd \quad \therefore \quad d = \frac{M}{P} = \frac{-2835}{94.5 \times 10^3} = 0.030 \text{ m} \quad d = 30.0 \text{ mm} \uparrow
\]

\[
(b) \quad P = 94.5 \text{ kN} \uparrow

SOLUTION

For C200×17.1 rolled steel shape, $I_z = 0.538 \times 10^6 \text{mm}^4 = 0.538 \times 10^{-6} \text{m}^4$

$I_y = 13.4 \times 10^6 \text{mm}^4 = 13.4 \times 10^{-6} \text{m}^4$

\[ z_E = z_D = -z_A = -z_B = \frac{1}{2} (203) = 101.5 \text{ mm} \]

\[ y_D = y_B = -14.4 \text{ mm} \quad y_E = y_A = 57 - 14.4 = 42.6 \text{ mm} \]

PROBLEM 4.139

The couple \( \mathbf{M} \) acts in a vertical plane and is applied to a beam oriented as shown. Determine (a) the angle that the neutral axis forms with the horizontal, (b) the maximum tensile stress in the beam.

SOLUTION

Bending moments:

\[
M_y' = -35 \sin 15^\circ = -9.059 \text{ kip} \cdot \text{in} \\
M_z' = -35 \cos 15^\circ = 33.807 \text{ kip} \cdot \text{in}
\]

Moments of inertia:

\[
I_y = \frac{1}{12} (2.4)^3 - \frac{1}{12} (2 \times 0.4)^3 = 12.267 \text{ in}^4 \\
I_z = \frac{1}{12} (2.4)^3 + \frac{1}{12} (2)(1.6)^3 = 2.987 \text{ in}^4
\]

(a) Neutral axis:

\[
\tan \phi = \frac{I_z}{I_y}, \quad \tan \theta = \frac{2.987 \text{ in}^4}{12.267 \text{ in}^4} \tan(-15^\circ) = -0.06525 \\
\phi = 3.73^\circ \quad \theta = 15^\circ - 3.73^\circ = 11.27^\circ
\]

\[
\alpha = 15^\circ - \phi = 15^\circ - 3.73^\circ = 11.27^\circ \quad \Rightarrow \quad \alpha = 11.3^\circ
\]

(b) Maximum tensile stress at \( D \):

\[
y_D' = -1.2 \text{ in} \quad z_D' = -2 \text{ in}.
\]

\[
\sigma_D = \frac{M_y y_D' - M_z z_D'}{I_y} - \frac{M_z y_D'}{I_z} = \frac{(-9.059 \text{ kip} \cdot \text{in})(-2 \text{ in})}{12.267 \text{ in}^4} - \frac{(33.807 \text{ kip} \cdot \text{in})(-1.2 \text{ in})}{2.987 \text{ in}^4}
\]

\[

I_y = 14.77 \times 10^3 \text{ mm}^4 \\
M_x = 120 \sin 70^\circ = 112.763 \text{ N} \cdot \text{m} \\
M_y = 120 \cos 70^\circ = 41.042 \text{ N} \cdot \text{m}

\[

\sigma_E = -\frac{M_x y_E' + M_y z_E'}{I_x} \\
\sigma_E = \frac{112.763(-0.016) + 41.042(0.010)}{53.6 \times 10^{-9}} \\

PROBLEM 4.141

The couple M acts in a vertical plane and is applied to a beam oriented as shown. Determine the stress at point A.

SOLUTION

\[ I_y = 2 \left( \frac{1}{3} (7.2)(2.4)^3 \right) = 66.355 \text{ in}^4 \]
\[ I_z = 2 \left( \frac{1}{12} (2.4)(7.2)^3 + (2.4)(7.2)(1.2)^2 \right) = 199.066 \text{ in}^4 \]
\[ I_{yz} = 2 \left( (2.4)(7.2)(1.2)(1.2) \right) = 49.766 \text{ in}^4 \]

Using Mohr’s circle determine the principal axes and principal moments of inertia.

\[ Y: (66.355 \text{ in}^4, 49.766 \text{ in}^4) \]
\[ Z: (199.066 \text{ in}^4, -49.766 \text{ in}^4) \]
\[ E: (132.710 \text{ in}^4, 0) \]
PROBLEM 4.141 (Continued)

\[ \tan 2\theta_m = \frac{DY}{DE} = \frac{49.766}{66.355} \]
\[ 2\theta_m = 36.87^\circ \quad \theta_m = 18.435^\circ \]

\[ R = \sqrt{DE^2 + DY^2} = 82.944 \text{ in}^4 \]
\[ I_u = 132.710 - 82.944 = 49.766 \text{ in}^4 \]
\[ I_v = 132.710 + 82.944 = 215.654 \text{ in}^4 \]

\[ M_u = 125\sin 18.435^\circ = 39.529 \text{ kip \cdot in} \]
\[ M_v = 125\cos 18.435^\circ = 118.585 \text{ kip \cdot in} \]
\[ u_A = 4.8\cos 18.435^\circ + 2.4\sin 18.435^\circ = 5.3126 \text{ in.} \]
\[ v_A = -4.8\sin 18.435^\circ + 2.4\cos 18.435^\circ = 0.7589 \text{ in.} \]

\[ \sigma_A = -\frac{M_u u_A + M_v v_A}{I_v} \]
\[ = \frac{(118.585)(5.3126) + (39.529)(0.7589)}{215.654} = -\frac{49.766}{49.766} \]
\[ = -2.32 \text{ ksi} \quad \sigma_A = -2.32 \text{ ksi} \]
PROBLEM 4.142

The couple \( \mathbf{M} \) acts in a vertical plane and is applied to a beam oriented as shown. Determine the stress at point \( A \).

**SOLUTION**

Using Mohr's circle determine the principal axes and principal moments of inertia.

- \( Y \) : (8.7, 8.3) in\(^4\)
- \( Z \) : (24.5, -8.3) in\(^4\)
- \( E \) : (16.6, 0) in\(^4\)
- \( EF = 7.9 \) in\(^4\)
- \( FZ = 8.3 \) in\(^4\)

\[
R = \sqrt{7.9^2 + 8.3^2} = 11.46 \text{ in}^4
\]

\[
\tan 2\theta_m = \frac{FZ}{EF} = \frac{8.3}{7.9} = 1.0506
\]

\[
\theta_m = 23.2^\circ
\]

\[
\tan\theta_m = \sin 2\theta_m = \frac{55.15}{23.64} = 2.3373
\]

\[
\sin\theta_m = \frac{55.15}{\sqrt{23.64^2 + 2.3373^2}} = 0.9873
\]

\[
\cos\theta_m = \frac{23.64}{\sqrt{23.64^2 + 2.3373^2}} = 0.1927
\]

\[
u_A = z_A \cos\theta_m - y_A \sin\theta_m = 28.06(0.1927) - 5.14(-0.9873) = 10.46 \text{ ksi}
\]

\[
u_A = z_A \cos\theta_m - y_A \sin\theta_m = 28.06(0.1927) - 5.14(-0.9873) = 10.46 \text{ ksi}

PROBLEM 4.143

The couple $\mathbf{M}$ acts in a vertical plane and is applied to a beam oriented as shown. Determine the stress at point $A$.

SOLUTION

Using Mohr’s circle determine the principal axes and principal moments of inertia.

$Y: (1.894, 0.800) \times 10^6 \text{mm}^4$

$Z: (0.614, 0.800) \times 10^6 \text{mm}^4$

$E: (1.254, 0) \times 10^6 \text{mm}^4$

$$
R = \sqrt{EF^2 + FZ^2} = \sqrt{0.640^2 + 0.800^2} \times 10^{-6} = 1.0245 \times 10^6 \text{mm}^4
$$

$I_v = (1.254 - 1.0245) \times 10^6 \text{mm}^4 = 0.2295 \times 10^6 \text{mm}^4 = 0.2295 \times 10^{-6} \text{m}^4$

$I_u = (1.254 + 1.0245) \times 10^6 \text{mm}^4 = 2.2785 \times 10^6 \text{mm}^4 = 2.2785 \times 10^{-6} \text{m}^4$

$$
\tan 2\theta_m = \frac{FZ}{FE} = \frac{0.800 \times 10^6}{0.640 \times 10^6} = 1.25 \quad \theta_m = 25.67°
$$

$M_v = M \cos \theta_m = (1.2 \times 10^3) \cos 25.67° = 1.0816 \times 10^3 \text{N} \cdot \text{m}$

$M_u = -M \sin \theta_m = -(1.2 \times 10^3) \sin 25.67° = -0.5198 \times 10^3 \text{N} \cdot \text{m}$

$u_A = y_A \cos \theta_m - z_A \sin \theta_m = 45 \cos 25.67° - 45 \sin 25.67° = 21.07 \text{mm}$

$v_A = z_A \cos \theta_m + y_A \sin \theta_m = 45 \cos 25.67° + 45 \sin 25.67° = 60.05 \text{mm}$

$$
\sigma_A = -\frac{M_u u_A}{I_v} + \frac{M_u v_A}{I_u} = -\frac{(1.0816 \times 10^3)(21.07 \times 10^{-3})}{0.2295 \times 10^{-6}} + \frac{(-0.5198 \times 10^3)(60.05 \times 10^{-3})}{2.2785 \times 10^{-6}}

PROBLEM 4.144

The tube shown has a uniform wall thickness of 12 mm. For the loading given, determine (a) the stress at points \(A\) and \(B\), (b) the point where the neutral axis intersects line \(ABD\).

SOLUTION

Add \(y\)- and \(z\)-axes as shown. Cross section is a 75 mm \(\times\) 125 mm rectangle with a 51 mm \(\times\) 101 mm rectangular cutout.

\[
I_z = \frac{1}{12} (75)(125)^3 - \frac{1}{12} (51)(101)^3 = 7.8283 \times 10^6 \text{ mm}^4 = 7.8283 \times 10^{-6} \text{ m}^4
\]

\[
I_y = \frac{1}{12} (125)(75)^3 - \frac{1}{12} (101)(51)^3 = 3.2781 \times 10^3 \text{ mm}^4 = 3.2781 \times 10^{-6} \text{ m}^4
\]

\[A = (75)(125) - (51)(101) = 4.224 \times 10^3 \text{ mm}^2 = 4.224 \times 10^{-3} \text{ m}^2\]

Resultant force and bending couples:

\[P = 14 + 28 + 28 = 70 \text{ kN} = 70 \times 10^3 \text{ N}\]

\[M_z = -(62.5 \text{ mm})(14 \text{ kN}) + (62.5 \text{ mm})(28 \text{ kN}) + (62.5 \text{ mm})(28 \text{ kN}) = 2625 \text{ N} \cdot \text{m}\]

\[M_y = -(37.5 \text{ mm})(14 \text{ kN}) + (37.5 \text{ mm})(28 \text{ kN}) + (37.5 \text{ mm})(28 \text{ kN}) = -525 \text{ N} \cdot \text{m}\]

(a) \[
\sigma_A = \frac{P}{A} - \frac{M_z y_A}{I_z} + \frac{M_y z_A}{I_y} = \frac{70 \times 10^3}{4.224 \times 10^{-3}} - \frac{(2625)(-0.0625)}{7.8283 \times 10^{-6}} + \frac{(525)(0.0375)}{3.2781 \times 10^{-6}}
\]

\[= 31.524 \times 10^6 \text{ Pa} \]

\[\sigma_A = 31.5 \text{ MPa} \]

(b) Let point \(H\) be the point where the neutral axis intersects \(AB\).

\[z_H = 0.0375 \text{ m}, \quad y_H = ?, \quad \sigma_H = 0\]

\[0 = \frac{P}{A} - \frac{M_z y_H}{I_z} + \frac{M_y z_H}{I_y}\]

\[y_H = \frac{I_z}{M_z} \left( \frac{P}{A} + \frac{M_z}{I_y} \right) = \frac{7.8283 \times 10^{-6}}{2625} \left[ \frac{70 \times 10^3}{4.224 \times 10^{-3}} + \frac{(-525)(0.0375)}{3.2781 \times 10^{-6}} \right]
\]

\[= 0.03151 \text{ m} = 31.51 \text{ mm}\]

\[31.51 + 62.5 = 94.0 \text{ mm}\]

Answer: 94.0 mm above point \(A\).

\[
I_y = \frac{1}{12} (125)(75)^3 - \frac{1}{12} (101)(51)^3 = 3.2781 \times 10^6 \text{ mm}^4 = 3.2781 \times 10^{-6} \text{ m}^4

4.147 In Prob. 4.146, determine (a) the value of $\theta$ for which the stress at $D$ reaches its largest value, (b) the corresponding values of the stress, at $A$, $B$, $C$, and $D$.

4.146 A rigid circular plate of 125-mm radius is attached to a solid 150 × 200-mm rectangular post, with the center of the plate directly above the center of the post. $\sigma_B = (-0.13333 + 0.53333 - 0.300) \times 10^6 \text{ Pa} = 0.100 \times 10^6 \text{ Pa} \hspace{0.5cm} \sigma_B = 100 \text{kPa}$

$\sigma_C = (-0.13333 + 0 + 0) \times 10^6 \text{ Pa} \hspace{0.5cm} \sigma_C = -133.3 \text{kPa}$

$\sigma_D = (-0.13333 - 0.53333 - 0.300) \times 10^6 \text{ Pa} = -0.967 \times 10^6 \text{ Pa} \hspace{0.5cm} \sigma_D = -967 \text{kPa}$

PROBLEM 4.148

Knowing that $P = 90$ kips, determine the largest distance $a$ for which the maximum compressive stress does not exceed 18 ksi.

SOLUTION

$$A = (5 \text{ in.})(6 \text{ in.}) - 2(2 \text{ in.})(4 \text{ in.}) = 14 \text{ in}^2$$

$$I_x = \frac{1}{12}(5 \text{ in.})(6 \text{ in.})^3 - \frac{1}{12}(2 \text{ in.})(4 \text{ in.})^3 = 68.67 \text{ in}^4$$

$$I_z = \frac{2}{12}(1 \text{ in.})(5 \text{ in.})^3 + \frac{1}{12}(4 \text{ in.})(1 \text{ in.})^3 = 21.17 \text{ in}^4$$

Force-couple system at $C$: $P = P$ $M_x = P(2.5 \text{ in.})$ $M_z = Pa$

For $P = 90$ kips: $P = 90$ kips $M_x = (90 \text{ kips})(2.5 \text{ in.}) = 225 \text{ kip \cdot in}$ $M_z = (90 \text{ kips})a$

Maximum compressive stress at $B$: $\sigma_B = -18$ ksi

$$\sigma_B = -\frac{P}{A} - \frac{M_x(3 \text{ in.})}{I_x} - \frac{M_z(2.5 \text{ in.})}{I_z}$$

$$-18 \text{ ksi} = -\frac{90 \text{ kips}}{14 \text{ in}^2} - \frac{(225 \text{ kip \cdot in})(3 \text{ in.})}{68.67 \text{ in}^4} - \frac{(90 \text{ kips})a(2.5 \text{ in.})}{21.17 \text{ in}^4}$$

$$-18 = -6.429 - 9.830 - 10.628a$$

$$-1.741 = -10.628a$$

$$a = 0.1638 \text{ in.}$$

A couple \( M_0 \) acting in a vertical plane is applied to a W12 × 16 rolled-steel beam, whose web forms an angle \( \theta \) with the vertical. Denoting by \( \sigma_0 \) the maximum stress in the beam when \( \theta = 0 \), determine the angle of inclination \( \theta \) of the beam for which the maximum stress is \( 2\sigma_0 \).

SOLUTION

For W12 × 16 rolled steel section,

\[
I_z = 103 \text{ in}^4 \quad I_y = 2.82 \text{ in}^4
\]

\[
d = 11.99 \text{ in.} \quad b_f = 3.990 \text{ in.}
\]

\[
y_A = \frac{d}{2} \quad z_A = \frac{b_f}{2}
\]

\[
\tan \varphi = \frac{I_z}{I_y} \tan \theta = \frac{103}{2.82} \tan \theta = 36.52 \tan \theta
\]

Point \( A \) is farthest from the neutral axis.

\[
M_y = M_0 \sin \theta \quad M_z = M_0 \cos \theta

\]

For \( \theta = 0 \), \( \sigma_0 = \frac{M_0d}{2I_z} \)

\[
\sigma_A = \sigma_0 \left( 1 + \frac{I_z b_f}{I_y d^2} \tan \theta \right) \cos \theta = 2\sigma_0

\[
\frac{I_z b_f}{I_y d^2} \tan \theta = \frac{(103)(3.990)}{(2.82)(11.99)} \left( \frac{2}{\cos \theta} - 1 \right)

\[
\tan \theta = 0.082273 \left( \frac{2}{\cos \theta} - 1 \right)

**PROBLEM 4.157**

A beam of unsymmetric cross section is subjected to a couple $\mathbf{M}_0$ acting in the horizontal plane $xz$. Show that the stress at point $A$, of coordinates $y$ and $z$, is

$$\sigma_A = \frac{zI_z - yI_{yz}}{I_yI_z - I_{yz}^2} M_y$$

where $I_y$, $I_z$, and $I_{yz}$ denote the moments and product of inertia of the cross section with respect to the coordinate axes, and $M_y$ the moment of the couple.

**SOLUTION**

The stress $\sigma_A$ varies linearly with the coordinates $y$ and $z$. Since the axial force is zero, the $y$- and $z$-axes are centroidal axes:

$$\sigma_A = C_1y + C_2z$$

where $C_1$ and $C_2$ are constants.

$$M_z = -\int y\sigma_A dA = -C_1\int y^2 dA - C_2\int yz dA$$

$$= -I_z C_1 - I_{yz} C_2 = 0$$

$$C_1 = -\frac{I_{yz}}{I_z} C_2$$

$$M_y = \int z\sigma_A dA = C_1\int yz dA + C_2\int z^2 dA$$

$$= I_{yz} C_1 + I_y C_2$$

$$= I_{yz} C_2 - I_{yz} C_2 + I_y C_2$$

$$I_z M_y = \left(I_y I_z - I_{yz}^2\right) C_2$$

$$C_2 = \frac{I_z M_y}{I_y I_z - I_{yz}^2}$$

$$C_1 = -\frac{I_{yz} M_y}{I_y I_z - I_{yz}^2}$$

PROBLEM 4.160

(a) Show that the stress at corner $A$ of the prismatic member shown in part $a$ of the figure will be zero if the vertical force $P$ is applied at a point located on the line

$$\frac{x}{b/6} + \frac{z}{h/6} = 1$$

(b) Further show that, if no tensile stress is to occur in the member, the force $P$ must be applied at a point located within the area bounded by the line found in part $a$ and three similar lines corresponding to the condition of zero stress at $B$, $C$, and $D$, respectively. This area, shown in part $b$ of the figure, is known as the *kern* of the cross section.

SOLUTION

Let $P$ be the load point.

$$I_z = \frac{1}{12} bh^3 \quad I_x = \frac{1}{12} bh^3 \quad A = bh$$

$$z_A = -\frac{h}{2} \quad x_A = -\frac{b}{2}$$

(a) For $\sigma_A = 0,$

$$1 - \frac{x}{b/6} - \frac{z}{h/6} = 0 \quad \frac{x}{b/6} + \frac{z}{h/6} = 1$$

(b) At point $E:$  

$$z = 0 \quad \therefore \quad x_E = b/6$$

At point $F:$  

$$x = 0 \quad \therefore \quad z_F = h/6$$

If the line of action $(x_p, z_p)$ lies within the portion marked $T_A,$ a tensile stress will occur at corner $A.$

By considering $\sigma_B = 0, \quad \sigma_C = 0, \quad$ and $\sigma_D = 0,$ the other portions producing tensile stresses are identified.
PROBLEM 4.161

For the machine component and loading shown, determine the stress at point A when (a) \( h = 2 \text{ in.} \), (b) \( h = 2.6 \text{ in.} \).

SOLUTION

\[ M = -4 \text{ kip} \cdot \text{in} \]

Rectangular cross section: \( A = bh \)  \( r_2 = 3 \text{ in.} \)  \( r_1 = r_2 - h \)

\[ \bar{r} = \frac{1}{2}(r_1 + r_2), \quad R = \frac{h}{\ln \frac{r_2}{r_1}}, \quad e = \bar{r} - R \]

(a) \( h = 2 \text{ in.} \)

\[ r_1 = 3 - 2 = 1 \text{ in.} \quad \bar{r} = \frac{1}{2}(3 + 1) = 2 \text{ in.} \]

\[ R = \frac{2}{\ln 2} = 1.8205 \text{ in.} \quad e = 2 - 1.8205 = 0.1795 \text{ in.} \]

At point A: \( r = r_1 = 1 \text{ in.} \)

\[ \sigma_A = \frac{M(r - R)}{Aer} = \frac{(-4)(1 - 1.8205)}{(1.5)(0.1795)(1)} = 12.19 \text{ ksi} \]

\[ \sigma_A = 12.19 \text{ ksi} \leftarrow \]

(b) \( h = 2.6 \text{ in.} \)

\[ r_1 = 3 - 2.6 = 0.4 \text{ in.} \quad \bar{r} = \frac{1}{2}(3 + 0.4) = 1.7 \text{ in.} \]

\[ R = \frac{2.6}{\ln \frac{r_2}{r_1}} = 1.2904 \text{ in.} \quad e = 1.7 - 1.2904 = 0.4906 \text{ in.} \]

At point A: \( r = r_1 = 0.4 \text{ in.} \)

\[ \sigma_A = \frac{M(r - R)}{Aer} = \frac{(-4)(0.4 - 1.2904)}{(1.95)(0.4096)(0.4)} = 11.15 \text{ ksi} \]

\[ M = -4 \text{ kip \cdot in} \]

Rectangular cross section: $h = 2.5$ in. $b = 0.75$ in. $A = 1.875 \text{ in.}^2$

\[ r_2 = 3 \text{ in.} \quad \eta = r_2 - h = 0.5 \text{ in.} \]

\[ F = \frac{1}{2}(\eta + r_2) = \frac{1}{2}(0.5 + 3.0) = 1.75 \text{ in.} \]

\[ R = \frac{h}{\ln \frac{r_2}{\eta}} = \frac{2.5}{\ln \frac{3.0}{0.5}} = 1.3953 \text{ in.} \]

\[ e = F - R = 1.75 - 1.3953 = 0.3547 \text{ in.} \]

At point A:

\[ r = \eta = 0.5 \text{ in.} \]

\[ \sigma_A = \frac{M(r - R)}{Aer} = \frac{(-4 \text{ kip \cdot in})(0.5 \text{ in} - 1.3953 \text{ in.})}{(0.75 \text{ in.})(2.5 \text{ in.})(0.3547 \text{ in.})(0.5 \text{ in.})} \]

PROBLEM 4.163

The curved portion of the bar shown has an inner radius of 20 mm. Knowing that the allowable stress in the bar is 150 MPa, determine the largest permissible distance $a$ from the line of action of the 3-kN force to the vertical plane containing the center of curvature of the bar.

SOLUTION

Reduce the internal forces transmitted across section $AB$ to a force-couple system at the centroid of the section. The bending couple is

$$M = P(a + \bar{r})$$

For the rectangular section, the neutral axis for bending couple only lies at

$$R = \frac{h}{\ln \frac{r_2}{r_1}}$$

Also $e = \bar{r} - R$

The maximum compressive stress occurs at point $A$. It is given by

$$\sigma_A = -\frac{P}{A} - \frac{My_A}{Aer_1} = -\frac{P + (a + \bar{r})y_A}{Aer_1} = -K\frac{P}{A}$$

with $y_A = R - r_1$

Thus,

$$K = 1 + \frac{(a + \bar{r})(R - r_1)}{er_1}$$

Data:

$h = 25$ mm, $r_1 = 20$ mm, $r_2 = 45$ mm, $\bar{r} = 32.5$ mm

$$R = \frac{25}{\ln \frac{45}{20}} = 30.8288 \text{ mm}, \quad e = 32.5 - 30.8288 = 1.6712 \text{ mm}$$

$b = 25$ mm, $A = bh = (25)(25) = 625 \text{ mm}^2 = 625 \times 10^{-6} \text{ m}^2 \quad R - r_1 = 10.8288 \text{ mm}$

$P = 3 \times 10^7 \text{ N} \cdot \text{m}, \quad \sigma_A = -150 \times 10^6 \text{ Pa}$

$$K = -\frac{\sigma_A A}{P} = -\frac{(-150 \times 10^6)(625 \times 10^{-6})}{3 \times 10^3} = 31.25$$

$$a + \bar{r} = \frac{(K - 1)er_1}{R - r_1} = \frac{(30.25)(1.6712)(20)}{10.8288} = 93.37 \text{ mm}$$

$$a = 93.37 - 32.5 = 60.9 \text{ mm}$$
PROBLEM 4.164

The curved portion of the bar shown has an inner radius of 20 mm. Knowing that the line of action of the 3-kN force is located at a distance $a = 60$ mm from the vertical plane containing the center of curvature of the bar, determine the largest compressive stress in the bar.

SOLUTION

Reduce the internal forces transmitted across section $AB$ to a force-couple system at the centroid of the section. The bending couple is

$$M = Pa + \tau$$

For the rectangular section, the neutral axis for bending couple only lies at

$$R = \frac{h}{\ln \frac{r_2}{r_1}}.$$  

Also $e = \tau - R$

The maximum compressive stress occurs at point $A$. It is given by

$$\sigma_A = -\frac{P}{A} - \frac{My_A}{Aer_1} = -\frac{P}{A} - \frac{P(a + \tau)y_A}{Aer_1} = -K\frac{P}{A}$$

with $y_A = R - r_1$

Thus,

$$K = 1 + \frac{(a + \tau)(R - r_1)}{er_1}.$$  

Data:

- $h = 25$ mm, $r_1 = 20$ mm, $r_2 = 45$ mm, $\tau = 32.5$ mm
- $R = \frac{25}{\ln \frac{45}{20}} = 30.8288$ mm, $e = 32.5 - 30.8288 = 1.6712$ mm
- $b = 25$ mm, $A = bh = (25)(25) = 625$ mm$^2 = 625 \times 10^{-6}$ m$^2$
- $a = 60$ mm, $a + \tau = 92.5$ mm, $R - r_1 = 10.8288$ mm

$$K = 1 + \frac{(92.5)(10.8288)}{(1.6712)(20)} = 30.968$$

$$P = 30 \times 10^3$$ N

$$\sigma_A = \frac{KP}{A} = -\frac{(30.968)(3 \times 10^3)}{625 \times 10^{-6}} = -148.6 \times 10^6$$ Pa

$$\sigma_A = -148.6 \text{ MPa}$$
PROBLEM 4.165

The curved bar shown has a cross section of $40 \times 60 \text{ mm}^2$ and an inner radius $r_1 = 15 \text{ mm}$. For the loading shown, determine the largest tensile and compressive stresses.

SOLUTION

\[ h = 40 \text{ mm}, \quad r_1 = 15 \text{ mm}, \quad r_2 = 55 \text{ mm} \]
\[ A = (60)(40) = 2400 \text{ mm}^2 = 2400 \times 10^{-6} \text{ m}^2 \]
\[ R = \frac{h}{\ln \frac{r_2}{r_1}} = \frac{40}{\ln \frac{55}{15}} = 30.786 \text{ mm} \]
\[ \bar{r} = \frac{1}{2}(r_1 + r_2) = 35 \text{ mm} \]
\[ e = \bar{r} - R = 4.214 \text{ mm} \]
\[ \sigma = \frac{My}{Aer} \]

At $r = 15 \text{ mm}, \quad y = 30.786 - 15 = 15.756 \text{ mm}$
\[ \sigma = \frac{(120)(15.786 \times 10^{-3})}{(2400 \times 10^{-6})(4.214 \times 10^{-3})(15 \times 10^{-3})} = -12.49 \times 10^{-6} \text{ Pa} \]
\[ \sigma = -12.49 \text{ MPa} \]

At $r = 55 \text{ mm}, \quad y = 30.786 - 55 = -24.214 \text{ mm}$
\[ \sigma = \frac{(120)(-24.214 \times 10^{-3})}{(2400 \times 10^{-6})(4.214 \times 10^{-3})(55 \times 10^{-3})} = 5.22 \times 10^6 \text{ Pa} \]
\[ \sigma = 5.22 \text{ MPa} \]
PROBLEM 4.166

For the curved bar and loading shown, determine the percent error introduced in the computation of the maximum stress by assuming that the bar is straight. Consider the case when (a) \( r_1 = 20 \) mm, (b) \( r_1 = 200 \) mm, (c) \( r_1 = 2 \) m.

SOLUTION

\[ h = 40 \text{ mm}, \quad A = (60)(40) = 2400 \text{ mm}^2 = 2400 \times 10^{-6} \text{ m}^2, \quad M = 120 \text{ N} \cdot \text{m} \]
\[ I = \frac{1}{12} bh^3 = \frac{1}{12} (60)(40)^3 = 0.32 \times 10^6 \text{ mm}^4 = 0.32 \times 10^{-6} \text{ m}^4, \quad c = \frac{1}{2} h = 20 \text{ mm} \]

Assuming that the bar is straight

\[ \sigma_s = \frac{Mc}{I} = \frac{(120)(20 \times 10^{-8})}{(0.32 \times 10^{-6})} = 7.5 \times 10^6 \text{ Pa} = 7.5 \text{ MPa} \]

(a) \( r_1 = 20 \) mm \( r_2 = 60 \) mm

\[ R = \frac{h}{\ln \frac{r_2}{r_1}} = \frac{40}{\ln \frac{60}{20}} = 36.4096 \text{ mm} \quad r_1 - R = -16.4096 \text{ mm} \]

\[ \bar{r} = \frac{1}{2}(r_1 + r_2) = 40 \text{ mm} \quad e = \bar{r} - R = 3.5904 \text{ mm} \]

\[ \sigma_a = \frac{M(r_1 - R)}{Aer} = \frac{(120)(-16.4096 \times 10^{-3})}{(2400 \times 10^{-6})(3.5904 \times 10^{-3})(20 \times 10^{-3})} = -11.426 \times 10^6 \text{ Pa} = -11.426 \text{ MPa} \]

\[ \% \text{ error} = \left(\frac{-11.426 - (-7.5)}{-11.426}\right) \times 100\% = -34.4\% \]

For parts (b) and (c), we get the values in the table below:

PROBLEM 4.167

The curved bar shown has a cross section of $30 \times 30$ mm. Knowing that $a = 60$ mm, determine the stress at (a) point $A$, (b) point $B$.

SOLUTION

Reduce the internal forces transmitted across section $AB$ to a force-couple system at the centroid of the section. The bending couple is

$$M = P(a + \bar{r})$$

For the rectangular section, the neutral axis for bending couple only lies at

$$R = \frac{h}{\ln \left(\frac{r_2}{r_1}\right)}.$$ 

Also $e = \bar{r} - R$

The maximum compressive stress occurs at point $A$. It is given by

$$\sigma_A = -\frac{P}{A} - \frac{My_A}{Aen_1} = -\frac{P}{A} - \frac{P(a + \bar{r})y_A}{Aen_1}$$

$$= -K\frac{P}{A} \quad \text{with} \quad y_A = R - r_1$$

Thus,

$$K = 1 + \frac{(a + \bar{r})(R - r_1)}{e n_1}$$

Data:

$h = 30$ mm, $r_1 = 20$ mm, $r_2 = 50$ mm, $\bar{r} = 35$ mm

$$R = \frac{30}{\ln \left(\frac{50}{20}\right)} = 32.7407 \text{ mm}, \quad e = 35 - 32.7407 = 2.2593 \text{ mm}$$

$b = 30$ mm, $A = bh = (30)(30) = 900 \text{ mm}^2 = 900 \times 10^{-6} \text{ m}^2$

$a = 60$ mm, $a + \bar{r} = 95$ mm, $R - r_1 = 12.7407 \text{ mm}$

$$K = 1 + \frac{(95)(12.7407)}{(2.2593)(20)} = 27.786$$

$$P = 5 \times 10^5 \text{ N}$$
PROBLEM 4.167 (Continued)

(a) \[ \sigma_A = -\frac{KP}{A} = -\frac{(27.786)(5 \times 10^3)}{900 \times 10^{-6}} = -154.4 \times 10^6 \text{ Pa} \]
\[ \sigma_A = -154.4 \text{ MPa} \]

(b) At point B, \[ y_B = r_2 - R = 50 - 32.7407 = 17.2953 \text{ mm} \]
\[ \sigma_B = \frac{P}{A} + \frac{My_B}{Ae_2} = \frac{P}{A} \left[ 1 + \frac{(a + \varphi) y_B}{e_2} \right] \]
\[ = \frac{K'P}{A} \quad \text{where} \quad K' = \frac{(a + \varphi) y_B}{e_2} - 1 \]
\[ K' = \frac{(95)(17.2953)}{(2.2593)(50)} - 1 = 13.545 \]
\[ \sigma_B = \frac{(13.545)(5 \times 10^3)}{900 \times 10^{-6}} = 75.2 \times 10^6 \text{ Pa} \]
\[ \sigma_B = 75.2 \text{ MPa} \]
PROBLEM 4.168

The curved bar shown has a cross section of $30 \times 30$ mm. Knowing that the allowable compressive stress is 175 MPa, determine the largest allowable distance $a$.

SOLUTION

Reduce the internal forces transmitted across section $AB$ to a force-couple system at the centroid of the section. The bending couple is

$$M = P(a + \bar{r})$$

For the rectangular section, the neutral axis for bending couple only lies at

$$R = \frac{h}{\ln \frac{r_2}{r_1}}$$

Also

$$e = \bar{r} - R$$

The maximum compressive stress occurs at point $A$. It is given by

$$\sigma_A = -\frac{P}{A} - \frac{My_A}{Aer_1} = -\frac{P}{A} - \frac{P(a + \bar{r})y_A}{Aer_1}$$

$$= -K\frac{P}{A}$$

with

$$y_A = R - r_1$$

Thus,

$$K = 1 + \frac{(a + \bar{r})(R - r_1)}{er_1}$$

Data:

- $h = 30$ mm, $r_1 = 20$ mm, $r_2 = 50$ mm, $\bar{r} = 35$ mm, $R = \frac{30}{\ln \frac{50}{20}} = 32.7407$ mm
- $e = 35 - 32.7407 = 2.2593$ mm, $b = 30$ mm, $R - r_1 = 12.7407$ mm, $a =$
- $\sigma_A = -175$ MPa $= -175 \times 10^6$ Pa, $P = 5$ kN $= 5 \times 10^3$ N
- $K = -\frac{A\sigma_A}{P} = -\frac{(900 \times 10^{-6})(-175 \times 10^6)}{5 \times 10^3} = 31.5$

Solving (1) for $a + \bar{r}$,

$$a + \bar{r} = \frac{(K - 1)er_1}{R - r_1}$$

$$a + \bar{r} = \frac{(30.5)(2.2593)(20)}{12.7407} = 108.17$$

PROBLEM 4.169

Steel links having the cross section shown are available with different central angles $\beta$. Knowing that the allowable stress is 12 ksi, determine the largest force $P$ that can be applied to a link for which $\beta = 90^\circ$.

SOLUTION

Reduce section force to a force-couple system at $G$; the centroid of the cross section $AB$.

$$a = \bar{r} \left( 1 - \cos \frac{\beta}{2} \right)$$

The bending couple is $M = -Pa$.

For the rectangular section, the neutral axis for bending couple only lies at

$$R = \frac{h}{\ln \frac{r_2}{r_1}}.$$ 

Also $e = \bar{r} - R$

At point $A$ the tensile stress is

$$\sigma_A = \frac{P}{A} - \frac{My_A}{Ae_i} = \frac{P}{A} + \frac{Pay_A}{Ae_i} = \frac{P}{A} \left( 1 + \frac{ay_A}{er_i} \right) = K \frac{P}{A}$$

where

$$K = 1 + \frac{ay_A}{er_i}$$ and $$y_A = R - r_i$$

$$P = \frac{A\sigma_A}{K}$$

Data:

$\bar{r} = 1.2$ in., $r_1 = 0.8$ in., $r_2 = 1.6$ in., $h = 0.8$ in., $b = 0.3$ in.

$A = (0.3)(0.8) = 0.24$ in$^2$ 

$R = \frac{0.8}{\ln \frac{0.8}{0.35416}} = 1.154156$ in.

$e = 1.2 - 1.154156 = 0.045844$ in., $y_A = 1.154156 - 0.8 = 0.35416$ in.

$a = 1.2(1 - \cos 45^\circ) = 0.35147$ in.

$K = 1 + \frac{(0.35147)(0.35416)}{(0.045844)(0.8)} = 4.3940$

$P = \frac{(0.24)(12)}{4.3940} = 0.65544$ kips

$P = 655$ lb

The bending couple is \( M = -Pa \).

For the rectangular section, the neutral axis for bending couple only lies at

\[ A = (0.3)(0.8) = 0.24 \text{ in}^2 \quad R = \frac{0.8}{\ln \frac{1.6}{0.8}} = 1.154156 \text{ in.} \]

\[ e = 1.2 - 1.154156 = 0.045844 \text{ in.} \]

\[ y_A = 1.154156 - 0.8 = 0.35416 \text{ in.} \]

\[ a = (1.2)(1 - \cos 30^\circ) = 0.160770 \text{ in.} \]

\[ K = 1 + \frac{(0.160770)(0.35416)}{(0.045844)(0.8)} = 2.5525 \]

PROBLEM 4.177

The curved bar shown has a circular cross section of 32-mm diameter. Determine the largest couple \( M \) that can be applied to the bar about a horizontal axis if the maximum stress is not to exceed 60 MPa.

SOLUTION

\[
c = 16 \text{ mm} \quad \bar{r} = 12 + 16 = 28 \text{ mm}
\]

\[
R = \frac{1}{2} \left[ \bar{r} + \sqrt{\bar{r}^2 - c^2} \right]
\]

\[
= \frac{1}{2} \left[ 28 + \sqrt{28^2 - 16^2} \right] = 25.4891 \text{ mm}
\]

\[
e = \bar{r} - R = 28 - 25.4891 = 2.5109 \text{ mm}
\]

\( \sigma_{\text{max}} \) occurs at \( A \), which lies at the inner radius.

It is given by \( \sigma_{\text{max}} = \frac{M y_A}{A e r} \) from which \( M = \frac{A e r \sigma_{\text{max}}}{y_A} \).

Also, \( A = \pi c^2 = \pi(16)^2 = 804.25 \text{ mm}^2 \)

Data: \( y_A = R - r_i = 25.4891 - 12 = 13.4891 \text{ mm} \)

\[
M = \frac{(804.25 \times 10^{-6})(2.5109 \times 10^{-3})(12 \times 10^{-3})(60 \times 10^6)}{13.4891 \times 10^{-3}} \quad M = 107.8 \text{ N} \cdot \text{m}

The bar shown has a circular cross section of 0.6 in. diameter. Knowing that \( a = 1.2 \text{ in.} \), determine the stress at (a) point \( A \), (b) point \( B \).

SOLUTION

\[ c = \frac{1}{2}d = 0.3 \text{ in.} \quad \overline{R} = 0.5 + 0.3 = 0.8 \text{ in.} \]

\[ R = \frac{1}{2}\left[\overline{R} + \sqrt{\overline{R}^2 - c^2}\right] = \frac{1}{2}\left[0.8 + \sqrt{0.8^2 - 0.3^2}\right] = 0.77081 \text{ in.} \]

\[ e = \overline{R} - R = 0.02919 \text{ in.} \]

\[ A = \pi c^2 = \pi(0.3)^2 = 0.28274 \text{ in}^2 \]

\[ P = 50 \text{ lb} \]

\[ M = -P(a + \overline{R}) = -50(1.2 + 0.8) = -100 \text{ lb} \cdot \text{ in} \]

\[ y_A = R - r_1 = 0.77081 - 0.5 = 0.27081 \text{ in.} \]

\[ y_B = R - r_2 = 0.77081 - 1.1 = -0.32919 \text{ in.} \]

(a) \[ \sigma_A = \frac{P}{A} - \frac{My_A}{Aer_1} = \frac{50}{0.28274} - \frac{(-100)(0.27081)}{(0.28274)(0.02919)(0.5)} = 6.74 \times 10^3 \text{ psi} \]

\[ \sigma_A = 6.74 \text{ ksi} \]

(b) \[ \sigma_B = \frac{P}{A} - \frac{My_B}{Aer_2} = \frac{50}{0.28274} - \frac{(-100)(-0.32919)}{(0.28274)(0.02919)(1.1)} = -3.45 \times 10^3 \text{ psi} \]

\[

\[
M = -P(a + \bar{r})

\[
\sigma_A = \frac{P}{A} \frac{My_A}{A r_1} = \frac{P}{A} + \frac{P(a + \bar{r})y_A}{A r_1} = \frac{P}{A} \left[ 1 + \frac{(a + \bar{r})y_A}{er_1} \right]
\]

\[
K = \frac{\sigma_A A}{P} = \frac{(8 \times 10^3) (0.28274)}{50} = 45.238

\[
a + \bar{r} = \frac{(K - 1)er_1}{y_A} = \frac{(44.238)(0.02919)(0.5)}{0.27081} = 2.384 \text{ in.}

PROBLEM 4.187

Show that if the cross section of a curved beam consists of two or more rectangles, the radius $R$ of the neutral surface can be expressed as

$$R = \frac{A}{\ln \left( \frac{b_2}{r_2} \right) \ln \left( \frac{b_3}{r_3} \right) \ln \left( \frac{b_4}{r_4} \right)}$$

where $A$ is the total area of the cross section.

SOLUTION

$$R = \frac{\Sigma A}{\Sigma \frac{1}{r} dA} = \frac{A}{\Sigma b_i \ln \frac{r_{i+1}}{r_i}} = \frac{A}{\Sigma \ln \left( \frac{r_{i+1}}{r_i} \right) h_i} = \frac{A}{\ln \left[ \left( \frac{r_2}{r_1} \right) \left( \frac{r_3}{r_2} \right) \left( \frac{r_4}{r_3} \right) \right]}$$

Note that for each rectangle,

$$\int \frac{1}{r} dA = \int_{r_j}^{r_{i+1}} b_i \frac{dr}{r} = b_i \int_{r_j}^{r_{i+1}} \frac{dr}{r} = b_i \ln \frac{r_{i+1}}{r_j}$$

PROBLEM 4.189

Using Eq. (4.66), derive the expression for $R$ given in Fig. 4.73 for a trapezoidal cross section.

SOLUTION

The section width $w$ varies linearly with $r$.

\[
w = c_0 + c_1 r
\]

$w = b_1$ at $r = r_1$ and $w = b_2$ at $r = r_2$

\[
b_1 = c_0 + c_1 r_1
\]

\[
b_2 = c_0 + c_1 r_2
\]

\[
b_1 - b_2 = c_1 (r_1 - r_2) = -c_1 h
\]

\[
c_1 = -\frac{b_1 - b_2}{h}
\]

\[
r_2 b_1 - r_1 b_2 = (r_2 - r_1) c_0 = h c_0
\]

\[
c_0 = \frac{r_2 b_1 - r_1 b_2}{h}
\]

\[

\[

\]
PROBLEM 4.190

Using Equation (4.66), derive the expression for $R$ given in Fig. 4.73 for a triangular cross section.

SOLUTION

The section width $w$ varies linearly with $r$.

$$w = c_0 + c_1 r$$
$$w = b$$ at $r = r_1$ and $w = 0$ at $r = r_2$

$$b = c_0 + c_1 r_1$$
$$0 = c_0 + c_1 r_2$$

$$b = c_1 (r_1 - r_2) = -c_1 h$$
$$c_1 = \frac{b}{h}$$ and $$c_0 = -c_1 r_2 = \frac{br_2}{h}$$

$$\int \frac{dA}{r} = \int_{r_1}^{r_2} \frac{w}{r} dr = \int_{r_1}^{r_2} \frac{c_0 + c_1 r}{r} dr$$

$$= c_0 \ln \left| \frac{r_2}{r_1} \right| + c_1 \left| r_2 \ln \frac{r_2}{r_1} - r_1 \ln \frac{r_1}{r_1} \right|$$

$$= \frac{br_2}{h} \ln \frac{r_2}{r_1} - \frac{b}{h}$$

$$A = \frac{1}{2} bh$$

$$R = \frac{A}{\int \frac{dA}{r}} = \frac{\frac{1}{2} bh}{b \left( \frac{r_2}{h} \ln \frac{r_2}{r_1} - 1 \right)} = \frac{\frac{1}{2} h}{\frac{r_2}{h} \ln \frac{r_2}{r_1} - 1}$$
**PROBLEM 4.191**

For a curved bar of rectangular cross section subjected to a bending couple \( \mathbf{M} \), show that the radial stress at the neutral surface is

\[
\sigma_r = \frac{M}{Ae} \left( 1 - \frac{r_1}{R} - \ln \frac{R}{r_1} \right)
\]

and compute the value of \( \sigma_r \) for the curved bar of Examples 4.10 and 4.11. (Hint: consider the free-body diagram of the portion of the beam located above the neutral surface.)

**SOLUTION**

At radial distance \( r \),

\[
\sigma_r = \frac{M(r - R)}{Ae} = \frac{MR}{Ae}
\]

For portion above the neutral axis, the resultant force is

\[
H = \int \sigma_r dA = \int_{r_1}^{R} \sigma_r b dr
\]

\[
= \frac{Mb}{Ae} \int_{r_1}^{R} \frac{MRb}{Ae} \frac{r dr}{R} = \frac{Mb}{Ae} (R - r_1) - \frac{MRb}{Ae} \ln \frac{R}{r_1} = \frac{MbR}{Ae} \left( 1 - \frac{r_1}{R} - \ln \frac{R}{r_1} \right)
\]

Resultant of \( \sigma_n \):

\[
F_r = \int \sigma_r \cos \beta dA
\]

\[
= \int_{-\theta_2}^{\theta_2} \sigma_r \cos \beta (bRd\beta) = \sigma_r \int_{-\theta_2}^{\theta_2} \cos \beta d\beta
\]

\[
= \sigma_r bR \sin \beta \int_{-\theta_2}^{\theta_2} = 2 \sigma_r bR \sin \frac{\theta_2}{2}
\]

For equilibrium:

\[
F_r - 2H \sin \frac{\theta}{2} = 0
\]

\[
2\sigma_r bR \sin \frac{\theta}{2} - 2 \frac{MbR}{Ae} \left( 1 - \frac{r_1}{R} - \ln \frac{R}{r_1} \right) \sin \frac{\theta}{2} = 0
\]

\[
\sigma_r = \frac{M}{Ae} \left( 1 - \frac{r_1}{R} - \ln \frac{R}{r_1} \right)
\]

Using results of Examples 4.10 and 4.11 as data,

\[
M = 8 \text{ kip} \cdot \text{in.}, \quad A = 3.75 \text{ in}^2, \quad R = 5.9686 \text{ in.}, \quad e = 0.0314 \text{ in.}, \quad r_1 = 5.25 \text{ in.}
\]

\[
\sigma_r = \frac{8}{(3.75)(0.0314)} \left[ 1 - \frac{5.25}{5.9686} - \ln \frac{5.9686}{5.25} \right]

\[

Straight rods of 6-mm diameter and 30-m length are stored by coiling the rods inside a drum of 1.25-m inside diameter. Assuming that the yield strength is not exceeded, determine (a) the maximum stress in a coiled rod, (b) the corresponding bending moment in the rod. Use $E = 200 \text{ GPa}$.

SOLUTION

Let $D =$ inside diameter of the drum.

$d =$ diameter of rod, $c = \frac{1}{2}d$,

$\rho =$ radius of curvature of centerline of rods when bent.

$$\rho = \frac{1}{2}D - \frac{1}{2}d = \frac{1}{2}(1.25) - \frac{1}{2}(6 \times 10^{-3}) = 0.622 \text{ m}$$

$$I = \frac{\pi c^4}{4} = \frac{\pi}{4}(0.003)^4 = 63.617 \times 10^{-12} \text{ m}^4$$

(a) $\sigma_{\text{max}} = \frac{Ec}{\rho} = \frac{(200 \times 10^9)(0.003)}{0.622} = 965 \times 10^6 \text{ Pa}$

$\sigma = 965 \text{ MPa}$

(b) $M = \frac{EI}{\rho} = \frac{(200 \times 10^9)(63.617 \times 10^{-12})}{0.622} = 20.5 \text{ N} \cdot \text{m}$

SOLUTION

\[ \text{① = rectangle} \]
\[ \text{② = semi-circular cutout} \]
\[ A_1 = (2.4)(1.2) = 2.88 \text{ in}^2 \]
\[ A_2 = \frac{\pi}{2}(0.75)^2 = 0.8836 \text{ in}^2 \]
\[ A = 2.88 - 0.8836 = 1.9964 \text{ in}^2 \]
\[ \bar{y}_1 = 0.6 \text{ in.} \]
\[ \bar{y}_2 = \frac{4r}{3\pi} = \frac{(4)(0.75)}{3\pi} = 0.3183 \text{ in.} \]
\[ \bar{y} = \frac{\Sigma A \bar{y}}{\Sigma A} = \frac{(2.88)(0.6) - (0.8836)(0.3183)}{1.9964} = 0.7247 \text{ in.} \]

Neutral axis lies 0.7247 in. above the bottom.

Moment of inertia about the base:
\[ I_b = \frac{1}{3}bh^3 \left( \frac{\pi}{8} r^4 \right) = \frac{1}{3}(2.4)(1.2)^3 \left( \frac{\pi}{8} (0.75)^4 \right) = 1.25815 \text{ in}^4 \]

Centroidal moment of inertia:
\[ \bar{I} = I_b - A \bar{y}^2 = 1.25815 - (1.9964)(0.7247)^2 = 0.2097 \text{ in}^4 \]
\[ y_{\text{top}} = 1.2 - 0.7247 = 0.4753 \text{ in.}, \]
\[ y_{\text{bot}} = -0.7247 \text{ in.} \]
\[ |\sigma| = \left| \frac{My}{I} \right| \quad M = \left| \frac{\sigma I}{y} \right| \]

Top: (tension side)

Bottom: (compression)

Choose the smaller value. \[ M = 4.63 \text{ kip \cdot in} \]
PROBLEM 4.195

In order to increase corrosion resistance, a 2-mm-thick cladding of aluminum has been added to a steel bar as shown. The modulus of elasticity is 200 GPa for steel and 70 GPa for aluminum. For a bending moment of 300 N·m, determine (a) the maximum stress in the steel, (b) the maximum stress in the aluminum, (c) the radius of curvature of the bar.

SOLUTION

Use aluminum as the reference material.

\[ n = \frac{E_s}{E_a} = \frac{200}{70} = 2.857 \text{ in steel.} \]

Cross section geometry:

Steel: \( A_s = (46 \text{ mm})(26 \text{ mm}) = 1196 \text{ mm}^2 \)  \( I_s = \frac{1}{12} (46 \text{ mm})(26 \text{ mm})^3 = 67,375 \text{ mm}^4 \)

Aluminum: \( A_a = (50 \text{ mm})(30 \text{ mm}) - 1196 \text{ mm}^2 = 304 \text{ mm}^2 \)

\[ I_a = \frac{1}{12} (50 \text{ mm})(30 \text{ mm})^3 - 67,375 \text{ mm}^4 = 45,125 \text{ mm}^4 \]

Transformed section.

\[ I = n_s I_s + n_a I_a = (1)(45,125) + (2.857)(67,375) = 237,615 \text{ mm}^4 = 237.615 \times 10^{-9} \text{ m}^4 \]

Bending moment: \( M = 300 \text{ N} \cdot \text{m} \)

(a) Maximum stress in steel: \( n_s = 2.857 \)  \( y_s = 13 \text{ mm} = 0.013 \text{ m} \)

\[ \sigma_s = \frac{n_s M y_s}{I} = \frac{(2.857)(300)(0.013)}{237.615 \times 10^{-9}} = 46.9 \times 10^6 \text{ Pa} \]

\[ \sigma_s = 46.9 \text{ MPa} \]

(b) Maximum stress in aluminum: \( n_a = 1, \)  \( y_a = 15 \text{ mm} = 0.015 \text{ m} \)

\[ \sigma_a = \frac{n_a M y_a}{I} = \frac{(1)(300)(0.015)}{237.615 \times 10^{-9}} = 18.94 \times 10^6 \text{ Pa} \]

\[ \sigma_a = 18.94 \text{ MPa} \]

(c) Radius of curvature: \( \rho = \frac{EI}{M} \)

\[ \rho = \frac{(70 \times 10^9)(237.615 \times 10^{-9})}{300} = 55.4 \text{ m} \]

$$M_x = Px \quad M_z = -Px$$

$$z_A = 1.5 \text{ in.}, \quad z_B = 1.5 \text{ in.}, \quad z_C = -1.5 \text{ in.}, \quad z_D = -1.5 \text{ in.}$$

$$\sigma_A = E\varepsilon_A = (29 \times 10^6)(-500 \times 10^{-6}) = -14,500 \text{ psi} = -14.5 \text{ ksi}$$

$$\sigma_B = E\varepsilon_B = (29 \times 10^6)(-1000 \times 10^{-6}) = -29,000 \text{ psi} = -29 \text{ ksi}$$

$$\sigma_C = E\varepsilon_C = (29 \times 10^6)(-200 \times 10^{-6}) = -5800 \text{ psi} = -5.8 \text{ ksi}$$

$$\sigma_A = -\frac{P}{A} - \frac{M_z x_A}{I_x} + \frac{M_x x_A}{I_z} = -0.06667 P - 0.13333 M_x - 0.08 M_z$$

$$\sigma_B = -\frac{P}{A} - \frac{M_z x_B}{I_x} + \frac{M_x x_B}{I_z} = -0.06667 P - 0.13333 M_x + 0.08 M_z$$

$$\sigma_C = -\frac{P}{A} - \frac{M_z x_C}{I_x} + \frac{M_x x_C}{I_z} = -0.06667 P + 0.13333 M_x + 0.08 M_z$$

Substituting the values for $\sigma_A$, $\sigma_B$, and $\sigma_C$ into (1), (2), and (3) and solving the simultaneous equations gives

$$M_x = 87 \text{ kip} \cdot \text{in}, \quad M_z = -90.625 \text{ kip} \cdot \text{in}, \quad (a) P = 152.25 \text{ kips}$$

$$x = -\frac{M_z}{P} = -\frac{-90.625}{152.25} \quad (b) x = 0.595 \text{ in.}$$

$$z = \frac{M_z}{P} = \frac{87}{152.25} \quad z = 0.571 \text{ in.}$$

$$\sigma_D = -\frac{P}{A} - \frac{M_z x_D}{I_x} + \frac{M_x x_D}{I_z} = -0.06667 P + 0.13333 M_x - 0.08 M_z$$

$$= -(0.06667)(152.25) + (0.13333)(87) - (0.08)(-90.625) = 8.70 \text{ ksi}$$

$$\varepsilon = \frac{\sigma_D}{E} = \frac{8.70 \times 10^3}{29 \times 10^6} \quad \varepsilon = 300 \mu \text{ in/lin}$$

PROBLEM 4.197

For the split ring shown, determine the stress at (a) point $A$, (b) point $B$.

SOLUTION

\[ r_1 = \frac{1}{2} \times 40 = 20 \text{ mm}, \quad r_2 = \frac{1}{2} \times (90) = 45 \text{ mm} \quad h = r_2 - r_1 = 25 \text{ mm} \]

\[ A = (14)(25) = 350 \text{ mm}^2 \quad R = \frac{h}{\ln \frac{r_2}{r_1}} = \frac{25}{\ln \frac{45}{20}} = 30.8288 \text{ mm} \]

\[ \bar{r} = \frac{1}{2}(r_1 + r_2) = 32.5 \text{ mm} \quad e = \bar{r} - R = 1.6712 \text{ mm} \]

Reduce the internal forces transmitted across section $AB$ to a force-couple system at the centroid of the cross section. The bending couple is

\[ M = Pa = P \bar{r} = (2500)(32.5 \times 10^{-3}) = 81.25 \text{ N} \cdot \text{m} \]

(a) Point $A$: \[ r_A = 20 \text{ mm} \quad y_A = 30.8288 - 20 = 10.8288 \text{ mm} \]

\[ \sigma_A = -\frac{P}{A} \frac{My_A}{AeR} = -\frac{2500}{350 \times 10^{-6}} \frac{(81.25)(10.8288 \times 10^{-3})}{(350 \times 10^{-6})(1.6712 \times 10^{-3})(20 \times 10^{-3})} \]

\[ = -82.4 \times 10^6 \text{ Pa} \]

(b) Point $B$: \[ r_B = 45 \text{ mm} \quad y_B = 30.8288 - 45 = -14.1712 \text{ mm} \]

\[ \sigma_B = -\frac{P}{A} \frac{My_B}{AeR_B} = -\frac{2500}{350 \times 10^{-6}} \frac{(81.25)(-14.1712 \times 10^{-3})}{(350 \times 10^{-6})(1.6712 \times 10^{-3})(45 \times 10^{-3})} \]

\[ = 36.6 \times 10^6 \text{ Pa} \]
PROBLEM 4.198

A couple $\mathbf{M}$ of moment 8 kN \cdot m acting in a vertical plane is applied to a W200 × 19.3 rolled-steel beam as shown. Determine (a) the angle that the neutral axis forms with the horizontal plane, (b) the maximum stress in the beam.

SOLUTION

For W200 × 19.3 rolled steel sector,

$\begin{align*}
I_z &= 16.6 \times 10^6 \text{ mm}^4 = 16.6 \times 10^{-6} \text{ m}^4 \\
I_y &= 1.15 \times 10^6 \text{ mm}^4 = 1.15 \times 10^{-6} \text{ m}^4 \\
y_A = y_B = -y_D = -y_E = \frac{203}{2} = 101.5 \text{ mm} \\
z_A = -z_B = -z_D = z_E = \frac{102}{2} = 51 \text{ mm} \\
M_z &= (8 \times 10^3) \cos 5^\circ = 7.9696 \times 10^3 \text{ N} \cdot \text{m} \\
M_y &= -(8 \times 10^3) \sin 5^\circ = -0.6972 \times 10^3 \text{ N} \cdot \text{m}
\end{align*}$

(a) \hspace{1cm} \tan \varphi = \frac{I_z}{I_y} \tan \theta = \frac{16.6 \times 10^{-6}}{1.15 \times 10^{-6}} \tan (-5^\circ) = -1.2629 \\
\varphi = -51.6^\circ \\
\alpha = 51.6^\circ - 5^\circ \hspace{1cm} \alpha = 46.6^\circ

(b) Maximum tensile stress occurs at point D.

$\begin{align*}
\sigma_D &= -\frac{M_y y_D}{I_z} + \frac{M_z z_D}{I_y} \\
&= -\frac{(7.9696 \times 10^3)(-101.5 \times 10^{-3})}{16.6 \times 10^{-6}} + \frac{(-0.6972 \times 10^3)(-51 \times 10^{-3})}{1.15 \times 10^{-6}} \\
&= 79.6 \times 10^6 \text{ Pa} \\
\sigma_D &= 79.6 \text{ MPa}
\end{align*}$
PROBLEM 4.199

Determine the maximum stress in each of the two machine elements shown.

SOLUTION

For each case, $M = (400)(2.5) = 1000$ lb · in

At the minimum section,

$I = \frac{1}{12}(0.5)(1.5)^3 = 0.140625$ in$^4$

$c = 0.75$ in.

(a) $D/d = 3/1.5 = 2$

$r/d = 0.3/1.5 = 0.2$

From Fig 4.32, $K = 1.75$

$\sigma_{\text{max}} = \frac{KMc}{I} = \frac{(1.75)(1000)(0.75)}{0.140625} = 9.33 \times 10^3$ psi

$\sigma_{\text{max}} = 9.33$ ksi

(b) $D/d = 3/1.5 = 2$ $r/d = 0.3/1.5 = 0.2$

From Fig. 4.31, $K = 1.50$

$\sigma_{\text{max}} = \frac{KMc}{I} = \frac{(1.50)(1000)(0.75)}{0.140625} = 8.00 \times 10^3$ psi

$\sigma_{\text{max}} = 8.00$ ksi
PROBLEM 4.200

The shape shown was formed by bending a thin steel plate. Assuming that the thickness $t$ is small compared to the length $a$ of a side of the shape, determine the stress $(a)$ at $A$, $(b)$ at $B$, $(c)$ at $C$.

SOLUTION

Moment of inertia about centroid:

$$I = \frac{1}{12} \left(2\sqrt{2}t\right) \left(\frac{a}{\sqrt{2}}\right)^3$$

$$= \frac{1}{12} ta^3$$

Area:

$$A = \left(2\sqrt{2}t\right) \left(\frac{a}{\sqrt{2}}\right) = 2at, \quad c = \frac{a}{2\sqrt{2}}$$

(a) $\sigma_A = \frac{P}{A} - \frac{Pe c}{I} = \frac{P}{2at} - \frac{P \left(\frac{a}{\sqrt{2}}\right) \left(\frac{a}{\sqrt{2}}\right)}{\frac{1}{12} ta^3}$

(b) $\sigma_B = \frac{P}{A} + \frac{Pe c}{I} = \frac{P}{2at} + \frac{P \left(\frac{a}{\sqrt{2}}\right) \left(\frac{a}{\sqrt{2}}\right)}{\frac{1}{12} ta^3}$

(c) $\sigma_C = \sigma_A$

\[\sigma_A = -\frac{P}{2at} \quad \sigma_B = -\frac{2P}{at} \quad \sigma_C = -\frac{P}{2at} \]
**PROBLEM 4.201**

Three 120 × 10-mm steel plates have been welded together to form the beam shown. Assuming that the steel is elastoplastic with $E = 200$ GPa and $\sigma_y = 300$ MPa, determine \(a\) the bending moment for which the plastic zones at the top and bottom of the beam are 40 mm thick, \(b\) the corresponding radius of curvature of the beam.

**SOLUTION**

\[ A_1 = (120)(10) = 1200 \text{ mm}^2 \]
\[ R_1 = \sigma_y A_1 = (300 \times 10^6)(1200 \times 10^{-6}) = 360 \times 10^3 \text{ N} \]
\[ A_2 = (30)(10) = 300 \text{ mm}^2 \]
\[ R_2 = \sigma_y A_2 = (300 \times 10^6)(300 \times 10^{-6}) = 90 \times 10^3 \text{ N} \]
\[ A_3 = (30)(10) = 300 \text{ mm}^2 \]
\[ R_3 = \frac{1}{2} \sigma_y A_2 = \frac{1}{2} (300 \times 10^6)(300 \times 10^{-6}) = 45 \times 10^3 \text{ N} \]
\[ y_1 = 65 \text{ mm} = 65 \times 10^{-3} \text{ m} \quad y_2 = 45 \text{ mm} = 45 \times 10^{-3} \text{ m} \quad y_3 = 20 \text{ mm} = 20 \times 10^{-3} \text{ m} \]

\(a\) \[ M = 2(R_1 y_1 + R_2 y_2 + R_3 y_3) = 2\{(360)(65) + (90)(45) + (45)(20)\} \]
\[ = 56.7 \times 10^3 \text{ N} \cdot \text{m} \quad \text{or} \quad M = 56.7 \text{ kN} \cdot \text{m} \]

\(b\) \[ \frac{y_y}{\rho} = \frac{\sigma_y}{E} \quad \rho = \frac{E y_y}{\sigma_y} = \frac{(200 \times 10^9)(30 \times 10^{-3})}{300 \times 10^6} \]
\[ = 20 \text{ m} \]
PROBLEM 4.202

A short column is made by nailing four 1×4-in. planks to a 4×4-in. timber. Determine the largest compressive stress created in the column by a 16-kip load applied as shown in the center of the top section of the timber if (a) the column is as described, (b) plank 1 is removed, (c) planks 1 and 2 are removed, (d) planks 1, 2, and 3 are removed, (e) all planks are removed.

SOLUTION

(a) Centric loading: \( M = 0 \quad \sigma = -\frac{P}{A} \)

\[ A = (4)(4) + (4)(1)(4) = 32 \text{ in}^2 \]

\[ \sigma = -\frac{16 \times 10^3}{32} = -500 \text{ psi} \]

(b) Eccentric loading: \( M = Pe \quad \sigma = \frac{P}{A} - \frac{P_{ec}}{I} \)

\[ A = (4)(4) + (3)(1)(3) = 28 \text{ in}^2 \quad e = \bar{y} \]

\[ \bar{y} = \frac{\Sigma A\bar{y}}{A} = \frac{(1)(4)(2.5)}{28} = 0.35714 \text{ in.} \]

\[ I = \Sigma (\bar{I} + Ad^2) = \frac{1}{12}(6)(4)^3 + (6)(4)(0.35714)^2 \]

\[ + \frac{1}{12}(4)(1)^3 + (4)(1)(2.14286)^2 = 53.762 \text{ in}^4 \]

\[ \sigma = -\frac{16 \times 10^3}{28} - \frac{(16 \times 10^3)(0.35714)(2.35714)}{53.762} \]

\[ \sigma = -822 \text{ psi} \]

(c) Centric loading: \( M = 0 \quad \sigma = -\frac{P}{A} \)

\[ A = (6)(4) = 24 \text{ in}^2 \]

\[ \sigma = -\frac{16 \times 10^3}{24} = -667 \text{ psi} \]
PROBLEM 4.202 (Continued)

(d) Eccentric loading:

\[ M = P e \]
\[ \sigma = -\frac{P}{A} - \frac{P_{ec}}{I} \]
\[ A = (4)(1) = (1)(4)(1) = 20 \text{ in}^2 \]
\[ e = \bar{x} \]
\[ \bar{x} = 2.5 - 2 = 0.5 \text{ in.} \]
\[ I = \frac{1}{12} (4)(5)^3 = 41.667 \text{ in}^4 \]
\[ \sigma = -\frac{16 \times 10^3}{20} - \frac{(16 \times 10^3)(0.5)(2.5)}{41.667} \]
\[ \sigma = -1280 \text{ psi} \triangleleft \]

(e) Centric loading:

\[ M = 0 \]
\[ \sigma = -\frac{P}{A} \]
\[ A = (4)(4) = 16 \text{ in}^2 \]
\[ \sigma = -\frac{16 \times 10^3}{16} \]
\[ \sigma = -1000 \text{ psi} \triangleleft \]
PROBLEM 4.203

Two thin strips of the same material and same cross section are bent by couples of the same magnitude and glued together. After the two surfaces of contact have been securely bonded, the couples are removed. Denoting by \( \sigma_1 \) the maximum stress and by \( \rho_1 \) the radius of curvature of each strip while the couples were applied, determine (a) the final stresses at points A, B, C, and D, (b) the final radius of curvature.

SOLUTION

Let \( b = \) width and \( t = \) thickness of one strip.

Loading one strip, \( M = M_1 \)

\[
I_1 = \frac{1}{12} bt^3, \quad c = \frac{1}{2} t
\]

\[
\sigma_1 = \frac{M_1 c}{I} = \frac{\sigma M_1}{bt^2}
\]

\[
\frac{1}{\rho_1} = \frac{M_1}{EI_1} = \frac{12 M_1}{Et^3}
\]

After \( M_1 \) is applied to each of the strips, the stresses are those given in the sketch above. They are

\[
\sigma_A = -\sigma_1, \quad \sigma_B = \sigma_1, \quad \sigma_C = -\sigma_1, \quad \sigma_D = \sigma_1
\]

The total bending couple is \( 2M_1 \).

After the strips are glued together, this couple is removed.

\[
M' = 2M_1, \quad I' = \frac{1}{12}b(2t)^3 = \frac{2}{3}bt^3, \quad c = t
\]

The stresses removed are

\[
\sigma' = -\frac{M'y}{I} = -\frac{2M_1 y}{\frac{2}{3}bt^3} = -\frac{3M_1 y}{bt^3}
\]

\[
\sigma'_A = -\frac{3M_1}{bt^3} = -\frac{1}{2} \sigma_1, \quad \sigma'_B = \sigma'_C = 0, \quad \sigma'_D = \frac{3M_1}{bt^3} = \frac{1}{2} \sigma_1
\]
PROBLEM 4.203 (Continued)

(a) Final stresses:

\[ \sigma_A = -\sigma_1 - \left( -\frac{1}{2} \sigma_1 \right) \]
\[ \sigma_A = -\frac{1}{2} \sigma_1 \]
\[ \sigma_B = \sigma_1 \]
\[ \sigma_C = -\sigma_1 \]
\[ \sigma_D = \sigma_1 - \frac{1}{2} \sigma_1 \]
\[ \sigma_D = -\frac{1}{2} \sigma_1 \]

\[ \frac{1}{\rho'} = \frac{E'I'}{EI'} = \frac{2M_1}{E\frac{2}{3}bt^3} = \frac{3M_1}{Et^3} = \frac{1}{4} \frac{1}{\rho'} \]

(b) Final radius:

\[ \frac{1}{\rho} = \frac{1}{\rho_1} - \frac{1}{\rho'} = \frac{1}{\rho_1} - \frac{1}{4} \frac{1}{\rho_1} = \frac{3}{4} \frac{1}{\rho_1} \]
\[ \rho = \frac{4}{3} \rho_1 \]

PROBLEM 5.14

Assuming that the reaction of the ground is uniformly distributed, draw the shear and bending-moment diagrams for the beam $AB$ and determine the maximum absolute value ($a$) of the shear, ($b$) of the bending moment.

SOLUTION

Over the whole beam,

$\sum F_y = 0: \quad 1.5w - 1.5 - 1.5 = 0 \quad \Rightarrow w = 2 \text{kN/m}$

$A$ to $C: \quad 0 \leq x < 0.3 \text{ m}$

PROBLEM 5.15

For the beam and loading shown, determine the maximum normal stress due to bending on a transverse section at C.

SOLUTION

Reaction at A:

\[ M_B = 0: \quad -4.5A + (3.0)(3) + (1.5)(3) + (1.8)(4.5)(2.25) = 0 \quad A = 7.05 \text{ kN} \uparrow \]

Use AC as free body.

\[ \sum M_C = 0: \quad M_C - (7.05)(1.5) + (1.8)(1.5)(0.75) = 0 \]

\[ M_C = 8.55 \text{ kN} \cdot \text{m} = 8.55 \times 10^3 \text{ N} \cdot \text{m} \]

\[ I = \frac{1}{12}bh^3 = \frac{1}{12}(80)(300)^3 = 180 \times 10^6 \text{ mm}^4 \]

\[ = 180 \times 10^{-6} \text{ m}^4 \]

\[ c = \frac{1}{2}(300) = 150 \text{ mm} = 0.150 \text{ m} \]

\[ \sigma = \frac{M_c I}{I} = \frac{(8.55 \times 10^3)(0.150)}{180 \times 10^{-6}} = 7.125 \times 10^6 \text{ Pa} \quad \sigma = 7.13 \text{ MPa} \downarrow \]
PROBLEM 5.16

For the beam and loading shown, determine the maximum normal stress due to bending on a transverse section at C.

SOLUTION

Use CB as free body.

\[ M_C = 0: \quad -M - (200)(6) \left( \frac{6}{2} \right) = 0 \]

\[ M = -3600 \text{ lb} \cdot \text{ft} \]

\[ = -43.2 \times 10^3 \text{ lb} \cdot \text{in} \]

For rectangular section,

\[ I = \frac{1}{12}bh^3 = \frac{1}{12}(4)(8)^3 = 170.667 \text{ in}^3 \]

\[ c = \frac{1}{2}h = 4 \text{ in.} \]

\[ \sigma = \frac{|M|c}{I} = \frac{(43.2 \times 10^3)(4)}{170.667} = 1.0125 \times 10^3 \text{ psi} \]

\[ \sigma = 1.013 \text{ ksi} \]
PROBLEM 5.17

For the beam and loading shown, determine the maximum normal stress due to bending on a transverse section at C.

SOLUTION

Use portion CB as free body.

\[ \sum M_C = 0 : \quad -M + (3)(2.1)(1.05) + (8)(2.1) = 0 \]

\[ M = 23.415 \text{ kN} \cdot \text{m} = 23.415 \times 10^3 \text{ N} \cdot \text{m} \]

For W310 × 60 : \( S = 844 \times 10^3 \text{ mm}^3 \)

\[ = 844 \times 10^{-6} \text{ m}^3 \]

Normal stress: \( \sigma = \frac{|M|}{S} = \frac{23.415 \times 10^3}{844 \times 10^{-6}} = 27.7 \times 10^6 \text{ Pa} \)

\[ \sigma = 27.7 \text{ MPa} \]
PROBLEM 5.18

For the beam and loading shown, determine the maximum normal stress due to bending on section $a-a$.

SOLUTION

Reactions: By symmetry, $A = B$

$\sum F_y = 0 : \quad A = B = 80 \text{kN}$

Using left half of beam as free body,

$\sum M_y = 0 :$

$-(80)(2) + (30)(1.2) + (50)(0.4) + M = 0$

$M = 104 \text{kN} \cdot \text{m} = 104 \times 10^3 \text{N} \cdot \text{m}$

For $W310 \times 52 : \quad S = 747 \times 10^3 \text{mm}^3$

$= 747 \times 10^{-6} \text{m}^3$

Normal stress: $\sigma = \frac{M}{S} = \frac{104 \times 10^3}{747 \times 10^{-6}} = 139.2 \times 10^6 \text{Pa}$

$\sigma = 139.2 \text{MPa}$
PROBLEM 5.19

For the beam and loading shown, determine the maximum normal stress due to bending on a transverse section at C.

SOLUTION

Use entire beam as free body.

\[ \sum M_B = 0 : \]

\[-90A + (75)(5) + (60)(5) + (45)(2) + (30)(2) + (15)(2) = 0 \]

\[ A = 9.5 \text{ kips} \]

Use portion AC as free body.

\[ \sum M_C = 0 : M - (15)(9.5) = 0 \]

\[ M = 142.5 \text{ kip} \cdot \text{in} \]

For \( S8 \times 18.4 \), \( S = 14.4 \text{ in}^3 \)

Normal stress:

\[ \sigma = \frac{M}{S} = \frac{142.5}{14.4} \]

\[ \sigma = 9.90 \text{ ksi} \]
**PROBLEM 5.20**

\[-4.8A + (3.6)(216) + (1.6)(150) + (0.8)(150) = 0
\]

\[A = 237 \text{ kN} \uparrow\]

Use portion \( AC \) as free body.

\[
(+) \sum M_C = 0:
\]

\[M - (2.4)(237) + (1.2)(216) = 0\]

\[M = 309.6 \text{ kN} \cdot \text{m}\]

For \( W460 \times 113, \ S = 2390 \times 10^6 \text{mm}^3\)

Normal stress:

\[
\sigma = \frac{M}{S} = \frac{309.6 \times 10^3 \text{N} \cdot \text{m}}{2390 \times 10^{-6} \text{m}^3} = 129.5 \times 10^6 \text{ Pa}

- At E: \( \sum M_E = 0: \quad -M + (2)(22.5) = 0 \quad M = 45 \text{kip} \cdot \text{ft} \)

\[ \max|M| = 45 \text{kip} \cdot \text{ft} = 540 \text{kip} \cdot \text{in} \]

For S12 × 35 rolled steel section: \( S = 38.1 \text{in}^3 \)

\[ + \sum M_f = 0 : \quad M + 40 - 35x = 0 \]
\[ M = (30x - 40) \text{kN} \cdot \text{m} \]

C to B: \( 1.6 \text{m} < x < 4.8 \text{m} \)
\[ + \sum F_y = 0 : \quad 35 - 25(x - 1.6) - V = 0 \]
\[ V = (-25x + 75) \text{kN} \]
\[ + \sum M_K = 0 : \quad M + 40 - 35x \]
\[ + (25)(x - 1.6) \left( \frac{x - 1.6}{2} \right) = 0 \]
\[ M = (-12.5x^2 + 75x - 72) \text{kN} \cdot \text{m} \]

Normal stress: For W200 \( \times 31.3 \), \( S = 298 \times 10^3 \text{mm}^3 \)
\[ \sigma = \frac{|M|}{S} = \frac{40.5 \times 10^3 \text{N} \cdot \text{m}}{298 \times 10^{-6} \text{m}^3} = 135.9 \times 10^6 \text{Pa} \quad \sigma = 135.9 \text{MPa} \]
PROBLEM 5.25

Draw the shear and bending-moment diagrams for the beam and loading shown, and determine the maximum normal stress due to bending.

SOLUTION

Reaction at C:
\[ \Sigma M_B = 0: \quad (18)(5) - 13C + (5)(10) = 0 \]
\[ C = 10.769 \text{ kips} \]

Reaction at B:
\[ \Sigma M_C = 0: \quad (5)(5) - (8)(10) + 13B = 0 \]
\[ B = 4.231 \text{ kips} \]

Shear diagram:

A to C:
\[ V = -5 \text{ kips} \]

C to D:
\[ V = -5 + 10.769 = 5.769 \text{ kips} \]

D to B:
\[ V = 5.769 - 10 = -4.231 \text{ kips} \]

At A and B,
\[ M = 0 \]

At C,
\[ \Sigma M_C = 0: \quad (5)(5) + M_C = 0 \]
\[ M_C = -25 \text{ kip} \cdot \text{ft} \]

At D,
\[ \Sigma M_D = 0: \quad -M_D + (5)(4.231) = 0 \]
\[ M_D = 21.155 \text{ kip} \cdot \text{ft} \]

\[ V_{\text{max}} = 5.77 \text{ kips} \quad \left| M_{\text{max}} \right| = 25 \text{ kip} \cdot \text{ft} = 300 \text{ kip} \cdot \text{in} \]

For W14 × 22 rolled steel section,
\[ S = 29.0 \text{ in}^3 \]

Normal stress:
\[ \sigma = \frac{M}{S} = \frac{300}{29.0} \]
\[ \sigma = 10.34 \text{ ksi} \]
**PROBLEM 5.26**

Knowing that \( W = 12 \text{kN} \), draw the shear and bending-moment diagrams for beam \( AB \) and determine the maximum normal stress due to bending.

**SOLUTION**

By symmetry, \( A = B \)

\[
+\sum F_y = 0: \quad A - 8 + 12 - 8 + B = 0 \quad A = B = 2 \text{kN}
\]

Shear:
- \( A \) to \( C^- \): \( V = 2 \text{kN} \)
- \( C^+ \) to \( D^- \): \( V = -6 \text{kN} \)
- \( D^+ \) to \( E^- \): \( V = 6 \text{kN} \)
- \( E^+ \) to \( B \): \( V = -2 \text{kN} \)

Bending moment:
- At \( C \), \( +\sum M_C = 0: \quad M_C - (1)(2) = 0 \quad M_C = 2 \text{kN} \cdot \text{m} \)

\[
\begin{align*}
\text{At } D, & \quad +\sum M_D = 0: \quad M_D - (2)(2) + (8)(1) = 0 \quad M_D = 4 \text{kN} \cdot \text{m} \\
\text{By symmetry, } & \quad M = 2 \text{kN} \cdot \text{m} \text{ at } E. \quad M_E = 2 \text{kN} \cdot \text{m} \\
\text{max } |M| & = 4 \text{kN} \cdot \text{m} \text{ occurs at } E.
\end{align*}
\]

For \( W310 \times 23.8 \), \( S_x = 280 \times 10^3 \text{mm}^3 = 280 \times 10^{-6} \text{m}^3 \)

Normal stress:
\[
\sigma_{\text{max}} = \frac{|M|_{\text{max}}}{S_x} = \frac{4 \times 10^3}{280 \times 10^{-6}} = 14.29 \times 10^6 \text{Pa} \quad \sigma_{\text{max}} = 14.29 \text{MPa}
\]
PROBLEM 5.27

Determine (a) the magnitude of the counterweight \( W \) for which the maximum absolute value of the bending moment in the beam is as small as possible, (b) the corresponding maximum normal stress due to bending. (Hint: Draw the bending-moment diagram and equate the absolute values of the largest positive and negative bending moments obtained.)

SOLUTION

By symmetry, \( A = B \)

\[
+ \sum F_y = 0: \quad A - 8 + W - 8 + B = 0 \quad \Rightarrow \quad A = B = 8 - 0.5W
\]

Bending moment at C:

\[
+ \sum M_C = 0: \quad -8(8 - 0.5W) + M_C = 0 \quad \Rightarrow \quad M_C = (8 - 0.5W) \text{ kN} \cdot \text{m}
\]

Bending moment at D:

\[
+ \sum M_D = 0: \quad -8(8 - 0.5W) + (8)(2) + M_D = 0 \quad \Rightarrow \quad M_D = (8 - W) \text{ kN} \cdot \text{m}
\]

Equate:

\[
-M_D = M_C \quad \Rightarrow \quad W - 8 = 8 - 0.5W
\]

(a) \( W = 10.6667 \text{ kN} \)

\[
M_C = -2.6667 \text{ kN} \cdot \text{m}
\]

\[
M_D = 2.6667 \text{ kN} \cdot \text{m} = 2.6667 \times 10^3 \text{ N} \cdot \text{m}
\]

\[
|M|_{\text{max}} = 2.6667 \text{ kN} \cdot \text{m}
\]

For W310 × 23.8 rolled steel shape,

\[
S_x = 280 \times 10^3 \text{ mm}^3 = 280 \times 10^{-6} \text{ m}^3
\]

(b) \( \sigma_{\text{max}} = \frac{|M|_{\text{max}}}{S_x} = \frac{2.6667 \times 10^3}{280 \times 10^{-6}} = 9.52 \times 10^6 \text{ Pa} \)

\( \sigma_{\text{max}} = 9.52 \text{ MPa} \)
PROBLEM 5.28

Determine (a) the distance \( a \) for which the absolute value of the bending moment in the beam is as small as possible, (b) the corresponding maximum normal stress due to bending.
(See hint of Prob. 5.27.)

SOLUTION

For W14 × 68, \( S_x = 103 \text{ in}^3 \)

Let \( b = (18 - a) \text{ ft} \)

Segment BC:
By symmetry, \( V_B = C \)
\[ +|\Sigma F_y| = 0: \quad V_B + C - 4b = 0 \]
\[ V_B = 2b \]
\[ +|\Sigma M_j| = 0: -V_B x + (4x)\left(\frac{x}{2}\right) - M = 0 \]
\[ M = V_B x - 2x^2 = 2bx - 2x^2 \text{ lb} \cdot \text{ft} \]
\[ \frac{dM}{dx} = 2b - x_m = 0 \quad x_m = \frac{1}{2}b \]
\[ M_{\text{max}} = b^2 - \frac{1}{2}b^2 = \frac{1}{2}b^2 \]

Segment AB:
\[ +|\Sigma M_K| = 0: -4(a - x)\left(\frac{a - x}{2}\right) - V_B (a - x) - M = 0 \]
\[ M = -2(a - x)^2 + 2b(a - x) \]
\[ |M_{\text{max}}| \text{ occurs at } x = 0. \]
\[ |M_{\text{max}}| = -2a^2 - 2ab = -2a^2 - 2a(18 - a) = 36a \]

(a) Equate the two values of \( |M_{\text{max}}|: \)
\[ 36a = \frac{1}{2}b^2 = \frac{1}{2}(18 - a)^2 = 162 - 18a + \frac{a^2}{2} \]
\[ \frac{1}{2}a^2 - 54a + 162 = 0 \quad a = 54 \pm \sqrt{(54)^2 - (4)(\frac{1}{2})(162)} \]
\[ a = 54 \pm 50.9118 = 3.0883 \text{ ft} \quad a = 3.09 \text{ ft} \]

(b) \( |M_{\text{max}}| = 36a = 111.179 \text{ kip} \cdot \text{ft} = 1334.15 \text{ kip} \cdot \text{in} \)
\[ \sigma = \frac{|M_{\text{max}}|}{S_x} = \frac{1334.15}{103} = 12.95 \text{ kips/in}^2 \quad \sigma_m = 12.95 \text{ ksi} \]

PROBLEM 5.29

Determine (a) the distance \( a \) for which the absolute value of the bending moment in the beam is as small as possible, (b) the corresponding maximum normal stress due to bending. (See hint of Prob. 5.27.)

SOLUTION

\[ + \sum M_C = 0 : 0.8a - (1.5)(1.2) - (2.7)(1.2) + (3.6)B = 0 \quad B = 1.4 - 0.22222a \uparrow \]

\[ + \sum M_B = 0 : (0.8)(3.6 + a) - 3.6C + (2.1)(1.2) + (0.9)(1.2) = 0 \quad C = 1.8 + 0.22222a \uparrow \]

Bending moment at \( C \):

\[ + \sum M_C = 0 : M_C + (0.8)(a) = 0 \]

\[ M_C = -0.8a \]

Bending moment at \( D \):

\[ \sum M_D = 0 : \]

\[ M_D + (0.8)(a + 1.5) - 1.5C = 0 \]

\[ M_D = 1.5 - 0.46667a \]

Bending moment at \( E \):

\[ + \sum M_E = 0 : -M_E + 0.9B = 0 \]

\[ M_E = 1.26 - 0.2a \]

Assume \(-M_C = M_E : 0.8a = 1.26 - 0.2a \quad a = 1.26 \text{ ft} \]

\[ M_C = -1.008 \text{ kip} \cdot \text{ft} \quad M_E = 1.008 \text{ kip} \cdot \text{ft} \quad M_D = 0.912 \text{ kip} \cdot \text{ft} \]

Note that \( |M_D| < 1.008 \text{ kip} \cdot \text{ft} \quad \max |M| = 1.008 \text{ kip} \cdot \text{ft} = 12.096 \text{ kip} \cdot \text{in} \)

For rolled steel section S3 × 5.7 : \( S = 1.67 \text{ in}^3 \)

PROBLEM 5.30

Knowing that $P = Q = 480$ N, determine (a) the distance $a$ for which the absolute value of the bending moment in the beam is as small as possible, (b) the corresponding maximum normal stress due to bending. (See hint of Prob. 5.27.)

SOLUTION

$P = 480$ N $\quad Q = 480$ N

Reaction at $A$: $\sum M_p = 0$: $-Aa + 480(a - 0.5)$

$$-480(1 - a) = 0$$

$$A = \left(960 - \frac{720}{a}\right)$$ N

Bending moment at $C$: $\sum M_c = 0$: $-0.5A + M_c = 0$

$$M_c = 0.5A = \left(480 - \frac{360}{a}\right)$$ N m

Bending moment at $D$: $\sum M_d = 0$: $-M_d - 480(1 - a) = 0$

$$M_d = -480(1 - a)$$ N m

(a) Equate:

$$-M_d = M_c \quad 480(1 - a) = 480 - \frac{360}{a}$$

$$a = 0.86603$$ m

$$A = 128.62$$ N $\quad M_c = 64.31$$ N m $\quad M_d = -64.31$$ N m

(b) For rectangular section, $S = \frac{1}{6}bh^2$

$$S = \frac{1}{6}(12)(13)^2 = 648$$ mm$^3 = 648 \times 10^{-9}$$ m$^3$

$$\sigma_{\text{max}} = \frac{|M|_{\text{max}}}{S} = \frac{64.31}{6.48 \times 10^{-9}} = 99.2 \times 10^6$$ Pa

$$\sigma_{\text{max}} = 99.2$$ MPa
PROBLEM 5.31

Solve Prob. 5.30, assuming that $P = 480$ N and $Q = 320$ N.

PROBLEM 5.30  Knowing that $P = Q = 480$ N, determine (a) the distance $a$ for which the absolute value of the bending moment in the beam is as small as possible, (b) the corresponding maximum normal stress due to bending. (See hint of Prob. 5.27.)

SOLUTION

\[ P = 480 \text{ N} \quad Q = 320 \text{ N} \]

Reaction at $A$: $+\sum M_D = 0: \quad Aa + 480(a - 0.5) - 320(1 - a) = 0$

\[ A = \left(800 - \frac{560}{a}\right) \text{ N} \]

Bending moment at $C$: $+\sum M_C = 0: \quad -0.5A + M_C = 0$

\[ M_C = 0.5A = \left(400 - \frac{280}{a}\right) \text{ N} \cdot \text{m} \]

Bending moment at $D$: $+\sum M_D = 0: \quad -M_D - 320(1 - a) = 0$

\[ M_D = (-320 + 320a) \text{ N} \cdot \text{m} \]

(a) Equate:

\[ -M_D = M_C \quad 320 - 320a = 400 - \frac{280}{a} \]

\[ 320a^2 + 80a - 280 = 0 \quad a = 0.81873 \text{ m}, -1.06873 \text{ m} \]

Reject negative root.  \[ a = 819 \text{ mm} \]

\[ A = 116.014 \text{ N} \quad M_C = 58.007 \text{ N} \cdot \text{m} \quad M_D = -58.006 \text{ N} \cdot \text{m} \]

(b) For rectangular section, $S = \frac{1}{6}bh^2$

\[ S = \frac{1}{6}(12)(18)^2 = 648 \text{ mm}^2 = 648 \times 10^{-6} \text{ m}^2 \]

\[ \sigma_{\text{max}} = \frac{|M|_{\text{max}}}{S} = \frac{58.0065}{648 \times 10^{-6}} = 89.5 \times 10^6 \text{ Pa} \]

\[ \sigma_{\text{max}} = 89.5 \text{ MPa} \]
PROBLEM 5.32

A solid steel bar has a square cross section of side $b$ and is supported as shown. Knowing that for steel $\rho = 7860 \text{ kg/m}^3$, determine the dimension $b$ for which the maximum normal stress due to bending is (a) 10 MPa, (b) 50 MPa.

SOLUTION

Weight density: $\gamma = \rho g$

Let $L = \text{total length of beam.}$

$$W = AL\rho g = b^2L\rho g$$

Reactions at $C$ and $D$:

$$C = D = \frac{W}{2}$$

Bending moment at $C$:

$$\sum M_{C} = 0: \left(\frac{L}{6}\right)\left(\frac{W}{3}\right) + M = 0$$

$$M = -\frac{WL}{18}$$

Bending moment at center of beam:

$$\sum M_{E} = 0: \left(\frac{L}{4}\right)\left(\frac{W}{2}\right) - \left(\frac{L}{6}\right)\left(\frac{W}{2}\right) + M = 0$$

$$M = -\frac{WL}{24}$$

max $|M| = \frac{WL}{18} = \frac{b^2L^2\rho g}{18}$

For a square section,

$$S = \frac{1}{6} b^5$$

Normal stress:

$$\sigma = \frac{|M|}{S} = \frac{b^2L^2\rho g/18}{b^5/6} = \frac{L^2\rho g}{3b}$$

Solve for $b$:

$$b = \frac{L^2\rho g}{3\sigma}$$

Data: $L = 3.6 \text{ m} \quad \rho = 7860 \text{ kg/m}^3 \quad g = 9.81 \text{ m/s}^2 \quad (a) \sigma = 10 \times 10^6 \text{ Pa} \quad (b) \sigma = 50 \times 10^6 \text{ Pa}$

(a) $b = \frac{(3.6)^2(7860)(9.81)}{(3)(10 \times 10^6)} = 33.3 \times 10^{-3} \text{ m}$

(b) $b = \frac{(3.6)^2(7860)(9.81)}{(3)(50 \times 10^6)} = 6.66 \times 10^{-3} \text{ m}$

(a) $b = 33.3 \text{ mm}$

(b) $b = 6.66 \text{ mm}$
PROBLEM 5.33

A solid steel rod of diameter \(d\) is supported as shown. Knowing that for steel \(\gamma = 490 \text{ lb/ft}^3\), determine the smallest diameter \(d\) that can be used if the normal stress due to bending is not to exceed 4 ksi.

SOLUTION

Let \(W = \text{total weight}\).

\[ W = AL\gamma = \frac{\pi}{4}d^2L\gamma \]

Reaction at \(A\):

\[ A = \frac{1}{2}W \]

Bending moment at center of beam:

\[ M = \frac{WL}{8} = \frac{\pi}{32}d^2L^2\gamma \]

For circular cross section, \(\left(c = \frac{1}{2}d\right)\)

\[ I = \frac{\pi}{4}c^4, \quad S = \frac{I}{c} = \frac{\pi}{4}c^3 = \frac{\pi}{32}d^3 \]

Normal stress:

\[ \sigma = \frac{M}{S} = \frac{\frac{\pi}{32}d^2L^2\gamma}{\frac{\pi}{32}d^3} = \frac{L^2\gamma}{d} \]

Solving for \(d\),

\[ d = \frac{L^2\gamma}{\sigma} \]

Data:

\[ L = 10 \text{ ft} = (12)(10) = 120 \text{ in.} \]

\[ \gamma = 490 \text{ lb/ft}^3 = \frac{490}{12^3} = 0.28356 \text{ lb/in}^3 \]

\[ \sigma = 4 \text{ ksi} = 4000 \text{ lb/in}^2 \]

\[ d = \frac{(120)^2(0.28356)}{4000} \quad d = 1.021 \text{ in.} \]

Using the method of Sec. 5.3, solve Prob. 5.6a.

PROBLEM 5.6 For the beam and loading shown, (a) draw the shear and bending-moment diagrams, (b) determine the equations of the shear and bending-moment curves.

SOLUTION

Reactions. \[ A = D = \frac{1}{2}w(L - 2a) \]

At A. \[ V_A = A = \frac{1}{2}w(L - 2a), \quad M_A = 0 \]

At A to B. \[ 0 < x < a \quad w = 0 \]

\[ V_B - V_A = -\int_0^a w\,dx = 0 \]

\[ V_B = V_A = \frac{1}{2}w(L - 2a) \]

\[ M_B - M_A = \int_0^a V\,dx = \int_0^a \frac{1}{2}w(L - 2a)\,dx \]

\[ M_B = \frac{1}{2}w(L - 2a)a \]

B to C. \[ a < x < L - a \quad w = w \]

\[ V - V_B = -\int_a^L w\,dx = -w(x - a) \]

\[ V = \frac{1}{2}w(L - 2a) - w(x - a) = \frac{1}{2}w(L - 2x) \]

\[ \frac{dM}{dx} = V = \frac{1}{2}w(L - 2x) \]

\[ M - M_B = \int_a^x V\,dx = \frac{1}{2}w(Lx - x^2)|_a^x \]

\[ = \frac{1}{2}w(Lx - x^2 - La + a^2) \]

\[ M = \frac{1}{2}w(L - 2a)a + \frac{1}{2}w(Lx - x^2 - La + a^2) \]

\[ = \frac{1}{2}w(Lx - x^2 - a^2) \]
PROBLEM 5.39 (Continued)

At C. \[ x = L - a \quad V_C = -\frac{1}{2}w(L - 2a) \quad M_C = \frac{1}{2}(L - 2a)a \]
C to D. \[ V = V_C = -\frac{1}{2}w(L - 2a) \]
\[ M_B = 0 \]
At \( x = \frac{L}{2} \), \[ M_{\text{max}} = w\left(\frac{L^2}{8} - \frac{a^2}{2}\right) \]

Using the method of Sec. 5.3 solve Prob. 5.7.

PROBLEM 5.7 Draw the shear and bending-moment diagrams for the beam and loading shown, and determine the maximum absolute value (a) of the shear, (b) of the bending moment.

SOLUTION

Reaction at C:

\[ + \sum M_B = 0: \quad (16)(300) - 12C + (9)(240) + (5)(360) = 0 \]

\[ C = 730 \text{ lb} \uparrow \]

Shear diagram:

\[ A \text{ to } C: \quad V = -300 \text{ lb} \]
\[ C \text{ to } D: \quad V = -300 + 730 = 430 \text{ lb} \]
\[ D \text{ to } E: \quad V = 430 - 240 = 190 \text{ lb} \]
\[ E \text{ to } B: \quad V = 190 - 360 = -170 \text{ lb} \]

Areas of shear diagram:

\[ A \text{ to } C: \quad A_{AC} = (-300)(4) = -1200 \text{ lb \cdot in} \]
\[ C \text{ to } D: \quad A_{CD} = (430)(3) = 1290 \text{ lb \cdot in} \]
\[ D \text{ to } E: \quad A_{DE} = (190)(4) = 760 \text{ lb \cdot in} \]
\[ E \text{ to } B: \quad A_{EB} = (-170)(5) = -850 \text{ lb \cdot in} \]

Bending moments:

\[ M_A = 0 \]
\[ M_C = 0 - 1200 = -1200 \text{ lb \cdot in} \]
\[ M_D = -1200 + 1290 = 90 \text{ lb \cdot in} \]
\[ M_E = 90 + 760 = 850 \text{ lb \cdot in} \]
\[ M_B = 850 - 850 = 0 \]

Using the method of Sec. 5.3, Solve Prob. 5.8

PROBLEM 5.8
Draw the shear and bending-moment diagram for the beam and loading shown, and determine the maximum absolute value (a) of the shear, (b) of the bending moment.

SOLUTION

Shear:
A to C: \( V = 100 \text{ N} \)
C to D: \( V = 100 - 200 = -100 \text{ N} \)
D to E: \( V = -100 - 200 = -300 \text{ N} \)
E to B: \( V = -300 + 500 = 200 \text{ N} \)

Areas under shear diagram:
A to C: \( \int Vdx = (100)(0.3) = 30 \text{ N} \cdot \text{m} \)
C to D: \( \int Vdx = (-100)(0.225) = -22.5 \text{ N} \cdot \text{m} \)
D to E: \( \int Vdx = (-300)(0.3) = -90 \text{ N} \cdot \text{m} \)
E to B: \( \int Vdx = (200)(0.225) = 45 \text{ N} \cdot \text{m} \)

Bending moments:
\( M_A = 37.5 \text{ N} \cdot \text{m} \)
\( M_C = M_A + \int_A^C V \, dx = 37.5 + 30 = 67.5 \text{ N} \cdot \text{m} \)
\( M_D = M_C + \int_C^D V \, dx = 67.5 - 22.5 = 45 \text{ N} \cdot \text{m} \)
\( M_E = M_D + \int_D^E V \, dx = 45 - 90 = -45 \text{ N} \cdot \text{m} \)
\( M_B = M_E + \int_E^B V \, dx = -45 + 45 = 0 \)

(a) Maximum \( |V| = 300 \text{ N} \)
(b) Maximum \( |M| = 67.5 \text{ N} \cdot \text{m} \)

**PROBLEM 5.9** Draw the shear and bending-moment diagrams for the beam and loading shown, and determine the maximum absolute value \((a)\) of the shear, \((b)\) of the bending moment.

**SOLUTION**

Reactions:

\[ + \sum M_C = 0 : 2A + (12)(2)(1) - (40)(1) = 0 \quad A = 8 \text{kN} \downarrow \]

\[ + \sum M_A = 0 : 2C - (12)(2)(1) - (40)(3) = 0 \quad C = 72 \text{kN} \uparrow \]

Shear diagram:  \(V_A = -8 \text{kN}\)

\(A\) to \(C\): \(0 < x < 2 \text{ m} \quad w = 12 \text{kN/m}\)

\[ V_C - V_A = -\int_0^2 w dx = -\int_0^2 12 dx = -24 \text{ kN} \]

\[ V_C = 24 - 8 = 32 \text{ kN} \]

\(C\) to \(B\): \(V_B = -32 + 72 = 40 \text{ kN}\)

Areas of shear diagram:

\(A\) to \(C\): \(\int V dx = \frac{1}{2}(-8 - 32)(2) = -40 \text{ kN} \cdot \text{m}\)

\(C\) to \(B\): \(\int V dx = (1)(40) = 40 \text{ kN} \cdot \text{m}\)

Bending moments:

\(M_A = 0\)

\(M_C = M_A + \int V dx = 0 - 40 = -40 \text{ kN} \cdot \text{m}\)

\(M_B = M_C + \int V dx = -40 + 40 = 0\)

PROBLEM 5.10 Draw the shear and bending-moment diagrams for the beam and loading shown, and determine the maximum absolute value (a) of the shear, (b) of the bending moment.

SOLUTION

Shear:

\[ V_A = 0 \]

\[ V_B = V_A - \int_A^B wdx = 0 - (4)(2) = -8 \text{ kips} \]

\[ C \text{ to } D: \ V = -8 \text{ kips} \]

\[ D \text{ to } B: \ V = -8 - 15 = -23 \text{ kips} \]

Areas under shear diagram:

\[ A \text{ to } C: \ \int Vdx = \left( \frac{1}{2} \right)(4)(-8) = -16 \text{ kip} \cdot \text{ft} \]

\[ C \text{ to } D: \ \int Vdx = (4)(-8) = -32 \text{ kip} \cdot \text{ft} \]

\[ D \text{ to } B: \ \int Vdx = (4)(-23) = -92 \text{ kip} \cdot \text{ft} \]

Bending moments:

\[ M_A = 0 \]

\[ M_C = M_A + \int Vdx = 0 - 16 = -16 \text{ kip} \cdot \text{ft} \]

\[ M_D = M_C + \int Vdx = -16 - 32 = -48 \text{ kip} \cdot \text{ft} \]

\[ M_B = M_D + \int Vdx = -48 - 92 = -140 \text{ kip} \cdot \text{ft} \]

SOLUTION

**Reaction at A:**

\[

\]

\[
A = 6.75 \text{ kN} \uparrow

**Reaction at B:**

\[
B = 6.75 \text{ kN} \uparrow

**Beam ACB and loading:** (See sketch.)

**Areas of load diagram:**

- **A to C:** \((2.4)(3.5) = 8.4 \text{ kN}\)
- **C to B:** \((0.6)(3.5) = 2.1 \text{ kN}\)

**Shear diagram:**

- \(V_A = 6.75 \text{ kN}\)
- \(V_C = 6.75 - 8.4 = -1.65 \text{ kN}\)
- \(V_C = -1.65 - 3 = -4.65 \text{ kN}\)

**At G,** \(V = 6.75 - 3.5x_G = 0\) \(x_G = 1.9286 \text{ m}\)

**Areas of shear diagram:**

- **C to B:** \[\frac{1}{2}(0.6)(-4.65 - 6.75) = -3.42 \text{ kN} \cdot \text{m}\]
**PROBLEM 5.44 (Continued)**

Bending moments:

\[ M_A = 0 \]
\[ M_G = 0 + 6.5089 = 6.5089 \text{ kN} \cdot \text{m} \]
\[ M_C = 6.5089 - 0.3889 = 6.12 \text{ kN} \cdot \text{m} \]
\[ M_{C^+} = 6.12 - 2.7 = 3.42 \text{ kN} \cdot \text{m} \]
\[ M_B = 3.42 - 3.42 = 0 \]

- \(D\) to \(E\): \(\int Vdx = (1)(-6) = -6 \text{ kN} \cdot \text{m} \)

Bending moments:
- \(M_A = 0\)
- \(M_{C^+} = 0 + 2 = 2 \text{ kN} \cdot \text{m} \)
- \(M_{C^-} = 2 + 4 = 6 \text{ kN} \cdot \text{m} \)

PROBLEM 5.46

Using the method of Sec. 5.3, solve Prob. 5.15

PROBLEM 5.15 For the beam and loading shown, determine the maximum normal stress due to bending on a transverse section at C.

SOLUTION

By symmetry, \( A = B \).

\[ \sum F_y = 0: \quad A + B - 3 - 3 - (4.5)(1.8) = 0 \]
\[ A = B = 7.05 \text{ kN} \]

Shear diagram: \( V_A = 7.05 \text{ kN} \)

\( A \) to \( C^- \):
\( w = 1.8 \text{ kN/m} \)
At \( C^- \), \( V = 7.05 - (1.8)(1.5) = 4.35 \text{ kN} \)
At \( C^+ \), \( V = 4.35 - 3 = 1.35 \text{ kN} \)
\( C^+ \) to \( D^- \):
\( w = 1.8 \text{ kN/m} \)
At \( D^- \), \( V = 1.35 - (1.5)(1.8) = -1.35 \text{ kN} \)
At \( D^+ \), \( V = -1.35 - 3 = -4.35 \text{ kN} \)
\( D^+ \) to \( B \):
\( w = 1.8 \text{ kN} \)
At \( B \), \( V = -4.35 - (1.5)(1.8) = -7.05 \text{ kN} \)

Draw the shear diagram:
\( V = 0 \) at point \( E \), the midpoint of \( CD \).

Areas of the shear diagram:
\( A \) to \( C \):
\[ \frac{1}{2} (7.05 + 4.35)(1.5) = 8.55 \text{ kN} \cdot \text{m} \]
\( C \) to \( E \):
\[ \frac{1}{2} (1.35)(0.75) = 0.50625 \text{ kN} \cdot \text{m} \]
\( E \) to \( D \):
\[ \frac{1}{2} (-1.35)(0.75) = -0.50625 \text{ kN} \cdot \text{m} \]
\( D \) to \( B \):
\[ \frac{1}{2} (-4.35 - 7.05)(1.5) = -8.55 \text{ kN} \cdot \text{m} \]
PROBLEM 5.46 (Continued)

Bending moments:

\[ M_A = 0 \]
\[ M_C = 0 + 8.55 = 8.55 \text{ kN} \cdot \text{m} \]
\[ M_E = 8.55 + 0.50625 = 9.05625 \text{ kN} \cdot \text{m} \]
\[ M_D = 9.05625 - 0.50625 = 8.55 \text{ kN} \cdot \text{m} \]
\[ M_B = 8.55 - 8.55 = 0 \]
\[ M_C = 8.55 \times 10^3 \text{ N} \cdot \text{m} \]

PROBLEM 5.16 For the beam and loading shown, determine the maximum normal stress due to bending on a transverse section at C.

SOLUTION

\[ + \sum M_C = 0: \quad -8A + (4)(2000) - (3)(6)(200) = 0 \]
\[ A = 550 \text{ lb} \uparrow \]
\[ + \sum M_A = 0: \quad 8C - (4)(2000) - (11)(6)(200) = 0 \]
\[ C = 2650 \text{ lb} \uparrow \]

Check:

\[ + \sum F_y = 550 - 2000 + 2650 - (6)(200) = 0 \]

- \( C^+ \) to \( B \):

\[ \int_8^{14} 200 \, dx = 1200 \text{ lb} \]

At \( B \), \( V = 0 \) as expected.

Areas of shear diagram:

- \( A \) to \( D \): \( A_{AD} = (550)(4) = 2200 \text{ lb} \cdot \text{ft} \)
- \( D \) to \( C \): \( A_{DC} = (-1450)(4) = -5800 \text{ lb} \cdot \text{ft} \)
- \( C \) to \( B \): \( A_{CB} = \frac{1}{2}(1200)(6) = 3600 \text{ lb} \cdot \text{ft} \)

Bending moments:

\[ M_A = 0 \]
\[ M_D = 0 + 2200 = 2200 \text{ lb} \cdot \text{ft} \]
\[ M_C = 2200 + (-5800) = -3600 \text{ lb} \cdot \text{ft} \]
\[ M_B = -3600 + 3600 = 0 \text{ as expected} \]
\[ |M|_{\text{max}} = 3600 \text{ lb} \cdot \text{ft} = 43200 \text{ lb} \cdot \text{in} \]

For a rectangular section,

\[ S = \frac{1}{6}bh^2 = \left(\frac{1}{6}\right)(4)(8)^2 = 42.667 \text{ in}^3 \]

\[ \sigma_{\text{max}} = \frac{|M|_{\text{max}}}{S} = \frac{43200}{42.667} = 1012.5 \text{ psi} \]

PROBLEM 5.53

Determine (a) the equations of the shear and bending-moment curves for the beam and loading shown, (b) the maximum absolute value of the bending moment in the beam.

SOLUTION

\[
\frac{dV}{dx} = -w = -w_0 \cos \frac{\pi x}{2L} \\
V = -\frac{2Lw_0}{\pi} \sin \frac{\pi x}{2L} + C_1 = \frac{dM}{dx} \\
M = \frac{4L^2w_0}{\pi^2} \cos \frac{\pi x}{2L} + C_1x + C_2 \\
V = 0 \quad \text{at} \quad x = 0. \quad \text{Hence,} \quad C_1 = 0. \\
M = 0 \quad \text{at} \quad x = 0. \quad \text{Hence,} \quad C_2 = -\frac{4L^2w_0}{\pi^2}. \\
\]

(a) \quad V = -(2Lw_0/\pi)\sin(\pi x/2L) \\
M = -(4L^2w_0/\pi^2)[1 - \cos(\pi x/2L)] \\
(b) \quad |M|_{\text{max}} = 4w_0L^2/\pi^2
PROBLEM 5.54

Draw the shear and bending-moment diagrams for the beam and loading shown and determine the maximum normal stress due to bending.

SOLUTION

\[ + \] \[ M_D = 0: \] \[ -12A + (9)(6)(2) - (2)(6) = 0 \]
\[ A = 8 \text{ kips} \]

\[ + \] \[ M_A = 0: \] \[ -3(6) + 12D - (14)(6) = 0 \]
\[ D = 10 \text{ kips} \]

Shear:

\[ V_A = 8 \text{ kips} \]
\[ V_C = 8 - (6)(2) = -4 \text{ kips} \]

C to D:
\[ V = -4 \text{ kips} \]

D to B:
\[ V = -4 + 10 = 6 \text{ kips} \]

Locate point E where \( V = 0 \).
\[
\frac{e}{8} = \frac{6 - e}{4} \\
12e = 48 \\
e = 4 \text{ ft} \\
6 - e = 2 \text{ ft} 
\]

Areas of the shear diagram:

A to E:
\[
\int Vdx = \left(\frac{1}{2}\right)(4)(8) = 16 \text{ kip} \cdot \text{ft} 
\]

E to C:
\[
\int Vdx = \left(\frac{1}{2}\right)(2)(-4) = -4 \text{ kip} \cdot \text{ft} 
\]

C to D:
\[
\int Vdx = (6)(-4) = -24 \text{ kip} \cdot \text{ft} 
\]

D to B:
\[
\int Vdx = (2)(6) = 12 \text{ kip} \cdot \text{ft} 
\]

Bending moments:

\[ M_A = 0 \]
\[ M_E = 0 + 16 = 16 \text{ kip} \cdot \text{ft} \]
\[ M_C = 16 - 4 = 12 \text{ kip} \cdot \text{ft} \]
\[ M_D = 12 - 24 = -12 \text{ kip} \cdot \text{ft} \]
\[ M_B = -12 + 12 = 0 \]

SOLUTION

\[ \sum M_C = 0 \quad \Rightarrow \quad (2)(1) - (3)(4)(2) + 4B = 0 \]
\[ B = 5.5 \text{kN} \]
\[ \sum M_B = 0 \quad \Rightarrow \quad (5)(2) + (3)(4)(2) - 4C = 0 \]
\[ C = 8.5 \text{kN} \]

Shear:

A to C: \[ V = -2 \text{kN} \]

C+: \[ V = -2 + 8.5 = 6.5 \text{kN} \]

B: \[ V = 6.5 - (3)(4) = -5.5 \text{kN} \]

Locate point D where \( V = 0 \).

\[ d = 2.1667 \text{ m} \quad 4 - d = 3.8333 \text{ m} \]

Areas of the shear diagram:

A to C: \[ \int Vdx = (-2.0)(1) = -2.0 \text{kN} \cdot \text{m} \]

C to D: \[ \int Vdx = \frac{1}{2}(2.16667)(6.5) = 7.0417 \text{kN} \cdot \text{m} \]

D to B: \[ \int Vdx = \frac{1}{2}(3.8333)(-5.5) = -5.0417 \text{kN} \cdot \text{m} \]

Bending moments:

\[ M_A = 0 \]

\[ M_C = 0 - 2.0 = -2.0 \text{kN} \cdot \text{m} \]

\[ M_D = -2.0 + 7.0417 = 5.0417 \text{kN} \cdot \text{m} \]

\[ M_B = 5.0417 - 5.0417 = 0 \]

\[ I = \frac{\pi}{4} \left( c_o^4 - c_i^4 \right) = \frac{\pi}{4} \left[ (80)^4 - (70)^4 \right] = 13.3125 \times 10^6 \text{ mm}^4 \]

\[ S = \frac{I}{c_o} = \frac{13.3125 \times 10^6}{80} = 166.406 \times 10^3 \text{ mm}^3 = 166.406 \times 10^{-6} \text{ m}^3 \]

- \( D \) to \( B \): \( V = -200 + 350 = 150 \text{ kN} \)

Areas of shear diagram:

PROBLEM 5.60

Beam $AB$, of length $L$ and square cross section of side $a$, is supported by a pivot at $C$ and loaded as shown. (a) Check that the beam is in equilibrium. (b) Show that the maximum stress due to bending occurs at $C$ and is equal to $w_0L^2/(1.5a)^3$.

SOLUTION

(a) Replace distributed load by equivalent concentrated load at the centroid of the area of the load diagram.

For the triangular distribution, the centroid lies at $x = \frac{2L}{3}$. $W = \frac{1}{2}w_0L$

\[ +\sum F_y = 0 : R_D - W = 0 \quad R_D = \frac{1}{2}w_0L \]

\[ +\sum M_C = 0 : 0 = 0 \quad \text{equilibrium} \]

\[ V = 0, \quad M = 0, \quad \text{at} \quad x = 0 \]

\[ 0 < x < \frac{2L}{3}, \quad \frac{dV}{dx} = -w = -\frac{w_0x}{L} \]

\[ \frac{dM}{dx} = V = -\frac{w_0x^2}{2L} + C_1 = -\frac{w_0x^2}{2L} \]

\[ M = -\frac{w_0x^3}{6L} + C_2 = -\frac{w_0x^3}{6L} \]

Just to the left of $C$,

\[ V = -\frac{w_0(2L/3)^2}{2L} = -\frac{2}{9}w_0L \]

Just to the right of $C$,

\[ V = \frac{2}{9}w_0L + R_D = \frac{5}{18}w_0L \]

Note sign change. Maximum $|M|$ occurs at $C$.

\[ M_C = -\frac{w_0(2L/3)^3}{6L} = -\frac{4}{81}w_0L^2 \]

Maximum $|M| = \frac{4}{81}w_0L^2$

For square cross section, \[ I = \frac{1}{12}a^4 \quad c = \frac{1}{2}a \]

\[ \sigma_m = \frac{|M|_{\max}}{I} \quad c = \frac{4}{81} \frac{w_0L^2}{a^3} = \frac{8}{27} \frac{w_0L^2}{a^3} = \left( \frac{2}{3} \right)^3 \frac{w_0L^2}{a^3} \]

\[ \sigma_m = \frac{w_0L^2}{(1.5a)^3} \]

$V_D = 48 - (0.3)(400) + (0.3)(160) = -48\text{kN}$

$V_B = -48 + (0.3)(160) = 0$

Locate point $E$ where $V = 0$.

By symmetry, $E$ is the midpoint of $CD$.

Areas of shear diagram:

$A$ to $C$: $\frac{1}{2}(0.3)(48) = 7.2 \text{kN} \cdot \text{m}$

$C$ to $E$: $\frac{1}{2}(0.2)(48) = 4.8 \text{kN} \cdot \text{m}$

$E$ to $D$: $\frac{1}{2}(0.2)(-48) = -4.8 \text{kN} \cdot \text{m}$

$D$ to $B$: $\frac{1}{2}(0.3)(-48) = -7.2 \text{kN} \cdot \text{m}$

Bending moments: $M_A = 0$

$M_C = 0 + 7.2 = 7.2 \text{kN}$

$M_E = 7.2 + 4.8 = 12.0 \text{kN}$

$M_D = 12.0 - 4.8 = 7.2 \text{kN}$

$M_B = 7.2 - 7.2 = 0$

Areas of shear diagram:

$A$ to $C$: \(\frac{1}{2}(1.5)(24.52 + 23.82) = 36.23 \text{ kip} \cdot \text{ft}\)

$C$ to $F$: \(\frac{1}{2}(5)(-2.01 - 4.41) = -16.05 \text{ kip} \cdot \text{ft}\)

$F$ to $B$: \(\frac{1}{2}(1.5)(-13.14 - 13.86) = 20.25 \text{ kip} \cdot \text{ft}\)

Bending moments:

$$\begin{align*}
M_A &= 0 \\
M_C &= 0 + 36.26 = 36.26 \text{ kip} \cdot \text{ft} \\
M_F &= 36.26 - 16.05 = 20.21 \text{ kip} \cdot \text{ft} \\
M_B &= 20.21 - 20.25 = 0
\end{align*}$$

Maximum $|M|$ occurs at $C$: $|M|_{\text{max}} = 36.26 \text{ kip} \cdot \text{ft} = 435.1 \text{ kip} \cdot \text{in}$

(b) Maximum stress:

$$\sigma = \frac{|M|_{\text{max}}}{S} = \frac{435.1}{27.5} = 15.82 \text{ ksi}$$
PROBLEM 5.63*

Beam AB supports a uniformly distributed load of 2 kN/m and two concentrated loads P and Q. It has been experimentally determined that the normal stress due to bending in bottom edge of the beam is −56.9 MPa at A and −29.9 MPa at C. Draw the shear and bending-moment diagrams for the beam and determine the magnitudes of the loads P and Q.

SOLUTION

\[ I = \frac{1}{12} (18)(36)^3 = 69.984 \times 10^3 \text{mm}^4 \]
\[ c = \frac{1}{2} d = 18 \text{ mm} \]
\[ S = \frac{I}{c} = 3.888 \times 10^3 \text{mm}^3 = 3.888 \times 10^{-6} \text{m}^3 \]

At A,
\[ M_A = S \sigma_A = (3.888 \times 10^{-6})(-56.9) = -221.25 \text{ N} \cdot \text{m} \]

At C,
\[ M_C = S \sigma_C = (3.888 \times 10^{-6})(-29.9) = -116.25 \text{ N} \cdot \text{m} \]

\[ \Sigma M_A = 0: \quad 221.23 - (0.1)(400) - 0.2P - 0.325Q = 0 \]
\[ \quad 0.2P + 0.325Q = 181.25 \quad (1) \]

\[ \Sigma M_C = 0: \quad 116.25 - (0.05)(200) - 0.1P - 0.225Q = 0 \]
\[ \quad 0.1P + 0.225Q = 106.25 \quad (2) \]

Solving (1) and (2) simultaneously,
\[ P = 500 \text{ N} \]
\[ Q = 250 \text{ N} \]

Reaction force at A:
\[ R_A = 400 - 500 - 250 = 0 \quad R_A = 1150 \text{ N} \cdot \text{m} \]

\[ V_A = 1150 \text{ N} \quad V_D = 250 \]
\[ M_A = -221.25 \text{ N} \cdot \text{m} \quad M_C = -116.25 \text{ N} \cdot \text{m} \quad M_D = -31.25 \text{ N} \cdot \text{m} \]

\[ |V|_{\text{max}} = 1150 \text{ N} \]
\[ |M|_{\text{max}} = 221 \text{ N} \cdot \text{m} \]
PROBLEM 5.64*

The beam $AB$ supports two concentrated loads $P$ and $Q$. The normal stress due to bending on the bottom edge of the beam is $+55\, \text{MPa}$ at $D$ and $+37.5\, \text{MPa}$ at $F$. (a) Draw the shear and bending-moment diagrams for the beam. (b) Determine the maximum normal stress due to bending that occurs in the beam.

**SOLUTION**

(a) 

\[ I = \frac{1}{12} (24)(60)^3 = 432 \times 10^3 \, \text{mm}^4 \quad c = 30 \, \text{mm} \]

\[ S = \frac{I}{c} = 14.4 \times 10^3 \, \text{mm}^3 = 14.4 \times 10^{-6} \, \text{m}^3 \quad M = S\sigma \]

At $D$, \[ M_D = (14.4 \times 10^{-6})(55 \times 10^6) = 792 \, \text{N} \cdot \text{m} \]

At $F$, \[ M_F = (14.4 \times 10^{-6})(37.5 \times 10^6) = 540 \, \text{N} \cdot \text{m} \]

Using free body $FB$,

\[ \sum F_y = 0: \quad -540 + 0.3B = 0 \]

\[ B = \frac{540}{0.3} = 1800 \, \text{N} \]

Using free body $DEFB$,

\[ \sum M_F = 0: \quad -792 - 3Q + (0.8)(1800) = 0 \]

\[ Q = 2160 \, \text{N} \]

Using entire beam,

\[ \sum F_y = 0: \quad A - 3240 - 2160 + 1800 = 0 \]

\[ A = 3600 \, \text{N} \]

Shear diagram and its areas:

- $A$ to $C^-$: \[ V = 3600 \, \text{N} \]
  \[ A_{AC} = (0.2)(3600) = 720 \, \text{N} \cdot \text{m} \]

- $C^+$ to $E^-$: \[ V = 3600 - 3240 = 360 \, \text{N} \]
  \[ A_{CE} = (0.5)(360) = 180 \, \text{N} \cdot \text{m} \]

- $E^+$ to $B$: \[ V = 360 - 2160 = -1800 \, \text{N} \]
  \[ A_{EB} = (0.5)(-1800) = -900 \, \text{N} \cdot \text{m} \]

Bending moments:

\[ M_A = 0 \]
\[ M_C = 0 + 720 = 720 \, \text{N} \cdot \text{m} \]
\[ M_E = 720 + 180 = 900 \, \text{N} \cdot \text{m} \]
\[ M_B = 900 - 900 = 0 \]

(b) Normal stress.

\[ \sigma_{\text{max}} = \frac{|M|_{\text{max}}}{S} = \frac{900}{14.4 \times 10^{-6}} = 62.5 \times 10^6 \, \text{Pa} \]

\[ \sigma_{\text{max}} = 62.5 \, \text{MPa} \]
PROBLEM 5.65

For the beam and loading shown, design the cross section of the beam, knowing that the grade of timber used has an allowable normal stress of 12 MPa.

SOLUTION

Reactions:

\begin{align*}
\Sigma M_D &= 0: \quad -2.4A + (1.6)(1.8) + (0.8)(3.6) = 0 \quad A = 2.4 \text{ kN} \\
\Sigma M_D &= 0: \quad -(0.8)(1.8) - (1.6)(3.6) + 2.4D = 0 \quad D = 3 \text{ kN}
\end{align*}

Construct shear and bending moment diagrams:

\begin{align*}
|M|_{\text{max}} &= 2.4 \text{ kN} \cdot \text{m} = 2.4 \times 10^3 \text{ N} \cdot \text{m} \\
\sigma_{\text{all}} &= 12 \text{ MPa} \\
&= 12 \times 10^6 \text{ Pa} \\
S_{\text{min}} &= \frac{|M|_{\text{max}}}{\sigma_{\text{all}}} = \frac{2.4 \times 10^3}{12 \times 10^6} \\
&= 200 \times 10^{-6} \text{ m}^3 \\
&= 200 \times 10^3 \text{ mm}^3 \\
S &= \frac{1}{6}bh^2 = \frac{1}{6}(40)h^2 \\
&= 200 \times 10^3 \\
h^2 &= \frac{(6)(200 \times 10^3)}{40} \\
&= 30 \times 10^3 \text{ mm}^2 \\
h &= 173.2 \text{ mm}
\end{align*}
PROBLEM 5.66

For the beam and loading shown, design the cross section of the beam, knowing that the grade of timber used has an allowable normal stress of 12 MPa.

SOLUTION

Reactions: \[ + \sum F_y = 0 : \quad A - (1.2)(18) = 0 \]
\[ \Rightarrow A = 21.6 \text{kN} \uparrow \]

\[ + \sum M_A = 0 : \quad - M_A - (1.8)(1.2)(18) = 0 \]
\[ \Rightarrow M_A = -38.88 \text{kN} \cdot \text{m} \]

Shear diagram:
\[ V_A = V_B = 21.6 \text{kN} \]
\[ V_C = 21.6 - (1.2)(18) = 0 \]

Areas of shear diagram:

\[ A \text{ to } B : (1.2)(21.6) = 25.92 \text{kN} \cdot \text{m} \]

\[ B \text{ to } C : \frac{1}{2}(1.2)(21.6) = 12.96 \text{kN} \cdot \text{m} \]

Bending moments:
\[ M_A = -38.88 \text{kN} \cdot \text{m} \]
\[ M_B = -38.88 + 25.92 = -12.96 \text{kN} \cdot \text{m} \]
\[ M_C = -12.96 + 12.96 = 0 \]

\[ \left|M\right|_{\text{max}} = 38.88 \text{kN} \cdot \text{m} = 3.88 \times 10^3 \text{N} \cdot \text{m} \]

\[ \sigma_{\text{max}} = \frac{\left|M\right|_{\text{max}}}{S} \]

\[ S = \frac{M_{\text{max}}}{\sigma_{\text{max}}} = \frac{38.8 \times 10^3 \text{N} \cdot \text{m}}{12 \times 10^6 \text{Pa}} = 3240 \times 10^{-6} \text{m}^2 = 3240 \times 10^3 \text{mm}^3 \]

For a rectangular section,
\[ S = \frac{1}{6}bh^2 \]
\[ h = \sqrt[3]{\frac{6S}{b}} = \sqrt[3]{\frac{6(3240 \times 10^3)}{125}} = 394 \text{mm} \]

\[ h = 394 \text{mm} \]
PROBLEM 5.67

For the beam and loading shown, design the cross section of the beam, knowing that the grade of timber used has an allowable normal stress of 1750 psi.

SOLUTION

Reactions: By symmetry, \( A = D \).

\[ + \sum F_y = 0 : \quad A - \frac{1}{2}(3)(1.5) - (6)(1.5) - \frac{1}{2}(3)(1.5) - D = 0 \]

\[ A = D = 6.75 \text{ kips} \uparrow \]

Shear diagram:

\[ V_A = 6.75 \text{ kips} \]

\[ V_B = 6.75 - \frac{1}{2}(3)(1.5) = 4.5 \text{ kips} \]

\[ V_C = 4.5 - (6)(1.5) = -4.5 \text{ kips} \]

\[ V_D = -4.5 - \frac{1}{2}(3)(1.5) = -6.75 \text{ kips} \]

Locate point \( E \) where \( V = 0 \):

By symmetry, \( E \) is the midpoint of \( BC \).

Areas of the shear diagram:

\[ A \text{ to } B : \quad (3)(4.5) + \frac{2}{3}(3)(2.25) = 18 \text{ kip} \cdot \text{ft} \]

\[ B \text{ to } E : \quad \frac{1}{2}(3)(4.5) = 6.75 \text{ kip} \cdot \text{ft} \]

\[ E \text{ to } C : \quad \frac{1}{2}(3)(-4.5) = -6.75 \text{ kip} \cdot \text{ft} \]

\[ C \text{ to } D : \quad \text{By antisymmetry, } -18 \text{ kip} \cdot \text{ft} \]
PROBLEM 5.67 (Continued)

Bending moments: \( M_A = 0 \)

\( M_B = 0 + 18 = 18 \text{ kip} \cdot \text{ft} \)

\( M_C = 18 + 6.75 = 24.75 \text{ kip} \cdot \text{ft} \)

\( M_C = 24.75 - 6.75 = 18 \text{ kip} \cdot \text{ft} \)

\( M_D = 18 - 18 = 0 \)

\[
\sigma_{\text{max}} = \frac{|M_{\text{max}}|}{S} \quad S = \frac{|M_{\text{max}}|}{\sigma_{\text{max}}} = \frac{(24.75 \text{ kip} \cdot \text{ft})(12 \text{ in/ft})}{1.750 \text{ ksi}} = 169.714 \text{ in}^3
\]

For a rectangular section, \( S = \frac{1}{6}bh^2 \)

\[
h = \sqrt[3]{\frac{6S}{b}} = \sqrt[3]{\frac{6(169.714)}{5}} = 14.27 \text{ in.} \quad \Rightarrow \quad h = 14.27 \text{ in.}
\]
PROBLEM 5.68

For the beam and loading shown, design the cross section of the beam, knowing that the grade of timber used has an allowable normal stress of 1750 psi.

SOLUTION

Equivalent concentrated load:

\[ P = \left( \frac{1}{2} \right)(6)(1.2) = 3.6 \text{ kips} \]

Bending moment at A:

\[ M_A = (2)(3.6) = 7.2 \text{ kip \cdot ft} = 86.4 \text{ kip \cdot in} \]

\[ S_{\text{min}} = \frac{|M_{\text{max}}|}{\sigma_{\text{all}}} = \frac{86.4}{1.75} = 49.37 \text{ in}^3 \]

For a square section, \[ S = \frac{1}{6}a^3 \]

\[ a = \sqrt[3]{6S} \]

\[ a_{\text{min}} = \sqrt[3]{6(49.37)} \quad a_{\text{min}} = 6.67 \text{ in.} \]
PROBLEM 5.69

For the beam and loading shown, design the cross section of the beam, knowing that the grade of timber used has an allowable normal stress of 12 MPa.

SOLUTION

By symmetry, $B = C$

$$+\sum F_y = 0: \quad B + C + 2.5 + 2.5 - (3)(6) = 0 \quad B = C = 6.5 \text{ kN}$$

Shear:

$A$ to $B$:

$$V = 2.5 \text{ kN}$$

$$V_{B'} = 2.5 + 6.5 = 9 \text{ kN}$$

$$V_{C'} = 9 - (3)(6) = -9 \text{ kN}$$

$C$ to $D$:

$$V = -9 + 6.5 = -2.5 \text{ kN}$$

Areas of the shear diagram:

$A$ to $B$:

$$\int Vdx = (0.6)(2.5) = 1.5 \text{ kN} \cdot \text{m}$$

$B$ to $E$:

$$\int Vdx = \frac{1}{2}(1.5)(9) = 6.75 \text{ kN} \cdot \text{m}$$

$E$ to $C$:

$$\int Vdx = -6.75 \text{ kN} \cdot \text{m}$$

$C$ to $D$:

$$\int Vdx = -1.5 \text{ kN} \cdot \text{m}$$

Bending moments:

$$M_A = 0$$

$$M_B = 0 + 1.5 = 1.5 \text{ kN} \cdot \text{m}$$

$$M_E = 1.5 + 6.75 = 8.25 \text{ kN} \cdot \text{m}$$

$$M_C = 8.25 - 6.75 = 1.5 \text{ kN} \cdot \text{m}$$

$$M_D = 1.5 - 1.5 = 0$$

Maximum $|M| = 8.25 \text{ kN} \cdot \text{m} = 8.25 \times 10^3 \text{ N} \cdot \text{m}$

$$\sigma_{\text{all}} = 12 \text{ MPa} = 12 \times 10^6 \text{ Pa}$$

$$S_{\text{min}} = \frac{|M|_{\text{max}}}{\sigma_{\text{all}}} = \frac{8.25 \times 10^3}{12 \times 10^6} = 687.5 \times 10^{-6} \text{ m}^3 = 687.5 \times 10^3 \text{ mm}^3$$

For a rectangular section,

$$S = \frac{1}{6}bh^2$$

$$687.5 \times 10^3 = \left(\frac{1}{6}\right)(100)h^2$$

$$h^2 = \frac{(6)(687.5 \times 10^3)}{100} = 41.25 \times 10^3 \text{ mm}^2 \quad h = 203 \text{ mm}$$
**PROBLEM 5.70**

For the beam and loading shown, design the cross section of the beam, knowing that the grade of timber used has an allowable normal stress of 12 MPa.

**SOLUTION**

\[ M_B = 0: \quad -2.4A + (0.6)(3.6)(3) = 0 \quad A = 2.7 \text{ kN} \]

\[ M_A = 0: \quad -(1.8)(3.6)(3) + 2.4B = 0 \quad B = 8.1 \text{ kN} \]

Shear:

\[ V_A = 2.7 \text{ kN} \]

\[ V_B = 2.7 - (2.4)(3) = -4.5 \text{ kN} \]

\[ V_C = 3.6 - (1.2)(3) = 0 \]

Locate point D where \( V = 0 \).

\[ d = \frac{2.4 - d}{2.7} = \frac{4.5}{7.2} = 4.5 \quad d = 0.9 \text{ m} \quad 2.4 - d = 1.5 \text{ m} \]

Areas of the shear diagram:

\[ A \text{ to } D: \quad \int Vdx = \frac{1}{2} (0.9)(2.7) = 1.215 \text{ kN} \cdot \text{m} \]

\[ D \text{ to } B: \quad \int Vdx = \frac{1}{2} (1.5)(-4.5) = -3.375 \text{ kN} \cdot \text{m} \]

\[ B \text{ to } C: \quad \int Vdx = \frac{1}{2} (1.2)(3.6) = 2.16 \text{ kN} \cdot \text{m} \]

Bending moments:

\[ M_A = 0 \]

\[ M_B = 0 + 1.215 = 1.215 \text{ kN} \cdot \text{m} \]

\[ M_B = 1.215 - 3.375 = -2.16 \text{ kN} \cdot \text{m} \]

\[ M_C = -2.16 + 2.16 = 0 \]

Maximum \( |M| = 2.16 \text{ kN} \cdot \text{m} = 2.16 \times 10^3 \text{ N} \cdot \text{m} \quad \sigma_{\text{all}} = 12 \text{ MPa} = 12 \times 10^6 \text{ Pa} \)

\[ S_{\text{min}} = \frac{|M|}{\sigma_{\text{all}}} = \frac{2.16 \times 10^3}{12 \times 10^6} = 180 \times 10^{-6} \text{ m}^3 = 180 \times 10^3 \text{ mm}^3 \]

For rectangular section,

\[ S = \frac{1}{6}bh^2 = \frac{1}{6}b(150)^2 = 180 \times 10^3 \]

\[ b = \frac{(6)(180 \times 10^3)}{150^2} \quad b = 48.0 \text{ mm} \]
PROBLEM 5.71

Knowing that the allowable stress for the steel used is 24 ksi, select the most economical wide-flange beam to support the loading shown.

SOLUTION

\[ \sum M_C = 0: \ (17)(62) - 12B + (5)(62) = 0 \]
\[ \sum M_B = 0: \ (5)(62) + 12C + (17)(62) = 0 \]

Shear diagram:

- \( A \) to \( B^- \): \( V = -62 \) kips
- \( B^- \) to \( C^- \): \( V = -62 + 113.667 = 51.667 \) kips
- \( C^- \) to \( D \): \( V = 51.667 - 113.667 = -62 \) kips.

Areas of shear diagram:

- \( A \) to \( B \): \( (5)(-62) = -310 \) kip·ft
- \( B \) to \( C \): \( (12)(51.667) = 620 \) kip·ft
- \( C \) to \( D \): \( (5)(-62) = -310 \) kip·ft

Bending moments:

- \( M_A = 0 \)
- \( M_B = 0 - 310 = -310 \) kip·ft
- \( M_C = -310 + 620 = 310 \) kip·ft
- \( M_D = 310 - 310 = 0 \)

\[ |M|_{\text{max}} = 310 \text{ kip·ft} = 3.72 \times 10^3 \text{ kip·in} \]

Required \( S_{\text{min}} \):

\[ S_{\text{min}} = \frac{|M|_{\text{max}}}{\sigma_{\text{all}}} = \frac{3.72 \times 10^3}{24} = 155 \text{ in}^3 \]

Knowing that the allowable stress for the steel used is 24 ksi, select the most economical wide-flange beam to support the loading shown.

SOLUTION

\[
\Sigma M_C = 0: \quad -24 A + (12)(24)(2.75) + (15)(24) = 0 \quad A = 48 \text{ kips}

\[
\Sigma M_A = 0: \quad 24 C - (12)(24)(2.75) - (9)(24) = 0 \quad C = 42 \text{ kips}

Lightest wide flange beam: W27×84 @ 84 lb/ft
PROBLEM 5.73

Knowing that the allowable stress for the steel used is 160 MPa, select the most economical wide-flange beam to support the loading shown.

SOLUTION

\[ w = \left( 6 + \frac{18 - 6x}{6} \right) = (6 + 2x) \text{kN/m} \]

\[ \frac{dV}{dx} = -w = -6 - 2x \]

\[ V = -6x - x^2 + C_1 \]

\[ V = 0 \quad \text{at} \quad x = 0, \quad C_1 = 0 \]

\[ \frac{dM}{dx} = V = -6x - x^2 \]

\[ M = -3x^2 - \frac{1}{3}x^3 + C_2 \]

\[ M = 0 \quad \text{at} \quad x = 0, \quad C_2 = 0 \]

\[ M = -3x^2 - \frac{1}{3}x^3 \]

\[ |M'_{\text{max}}| \text{ occurs at } x = 6 \text{ m.} \]

\[ |M'_{\text{max}}| = |-3(6)^2 - \frac{1}{3}(6)^3| = 80 \text{ kN} \cdot \text{m} = 180 \times 10^3 \text{ N} \cdot \text{m} \]

\[ \sigma_{\text{all}} = 160 \text{ MPa} = 160 \times 10^6 \text{ Pa} \]

PROBLEM 5.75

Knowing that the allowable stress for the steel used is 160 MPa, select the most economical S-shape beam to support the loading shown.

SOLUTION

Reaction: \( \Sigma M_D = 0 \)
\( A = 65 \text{kN} \uparrow \)

Shear diagram:

- \( A \) to \( B \): \( V = 65 \text{kN} \)
- \( B \) to \( C \): \( V = 65 - 60 = 5 \text{kN} \)
- \( C \) to \( D \): \( V = 5 - 40 = -35 \text{kN} \)

Areas of shear diagram:

- \( A \) to \( B \): \( (2.5)(65) = 162.5 \text{kN} \cdot \text{m} \)
- \( B \) to \( C \): \( (2.5)(5) = 12.5 \text{kN} \cdot \text{m} \)
- \( C \) to \( D \): \( (5)(-35) = -175 \text{kN} \cdot \text{m} \)

Bending moments:

- \( M_A = 0 \)
- \( M_B = 0 + 162.5 = 162.5 \text{kN} \cdot \text{m} \)
- \( M_C = 162.5 + 12.5 = 175 \text{kN} \cdot \text{m} \)
- \( M_D = 175 - 175 = 0 \)

\( |M|_{\text{max}} = 175 \text{kN} \cdot \text{m} = 175 \times 10^3 \text{N} \cdot \text{m} \)

\( \sigma_{\text{all}} = 160 \text{MPa} = 160 \times 10^6 \text{Pa} \)

PROBLEM 5.76

Knowing that the allowable stress for the steel used is 160 MPa, select the most economical S-shape beam to support the loading shown.

SOLUTION

Reactions: By symmetry, \( B = C \).

\[ + \sum F_y = 0 : -70 + B - (9)(45) + C - 70 = 0 \]

\[ B = C = 272.5 \text{kN} \uparrow \]

Shear:

\[ V_A = -70 \text{kN} \]

\[ V_{B-} = -70 + 0 = -70 \text{kN} \]

\[ V_{B+} = -70 + 272.5 = 202.5 \text{kN} \]

\[ V_{C-} = 202.5 - (9)(45) = -202.5 \text{kN} \]

\[ V_{C+} = -202.5 + 272.5 = 70 \text{kN} \]

\[ V_D = 70 \text{kN} \]

Draw shear diagram. Locate point \( E \) where \( V = 0 \).

\( E \) is the midpoint of \( BC \).

Areas of the shear diagram:

\[ \int A \text{ to } B: \int Vdx = (3)(-70) = -210 \text{kN} \cdot \text{m} \]

\[ \int B \text{ to } E: \int Vdx = \frac{1}{2}(4.5)(202.5) = 455.625 \text{kN} \cdot \text{m} \]

\[ \int E \text{ to } C: \int Vdx = \frac{1}{2}(4.5)(-202.5) = -455.625 \text{kN} \cdot \text{m} \]

\[ \int C \text{ to } D: \int Vdx = (3)(70) = 210 \text{kN} \cdot \text{m} \]
PROBLEM 5.76 (Continued)

Bending moments: \( M_A = 0 \)

\[ M_B = 0 - 210 = -210.5 \text{kN} \cdot \text{m} \]

\[ M_E = -210 + 455.625 = 245.625 \text{kN} \]

\[ M_C = 245.625 - 455.625 = -210 \text{kN} \]

\[ M_D = -210 + 210 = 0 \]

\[ |M|_{\text{max}} = 245.625 \text{kN} \cdot \text{m} = 245.625 \times 10^3 \text{N} \cdot \text{m} \]

\[ \sigma_{\text{all}} = 160 \text{MPa} = 160 \times 10^6 \text{Pa} \]

\[ \sigma = \frac{|M|}{S} \]

\[ S = \frac{|M|}{\sigma} = \frac{245.625 \times 10^3}{160 \times 10^6} = 1.5352 \times 10^{-3} \text{m}^3 \]

PROBLEM 5.79

Two L102 × 76 rolled-steel angles are bolted together and used to support the loading shown. Knowing that the allowable normal stress for the steel used is 140 MPa, determine the maximum angle of thickness that can be used.

SOLUTION

Reactions: By symmetry, \( A = C \)
\[ + \sum F_y = 0: \quad A - (2)(4.5) - 9 + C = 0 \]
\[ A = C = 9 \text{ kN} \uparrow \]

Shear:

\[ V_B^+ = 9 - (1)(4.5) = 4.5 \text{ kN} \]
\[ V_B^- = 4.5 - 9 = -4.5 \text{ kN} \]
\[ V_C = -4.5 - (1)(4.5) = -9 \text{ kN} \]

Areas of shear diagram:
\[ A \text{ to } B: \quad \int Vdx = \frac{1}{2}(1)(9 + 4.5) = 6.75 \text{ kN} \cdot \text{m} \]
\[ B \text{ to } C: \quad \int Vdx = \frac{1}{2}(1)(-9 - 4.5) = -6.75 \text{ kN} \cdot \text{m} \]

Bending moments:
\[ M_A = 0 \]
\[ M_B = 0 + 6.75 = 6.75 \text{ kN} \cdot \text{m} \]
\[ M_C = 6.75 - 6.75 = 0 \]

Two rolled-steel channels are to be welded back to back and used to support the loading shown. Knowing that the allowable normal stress for the steel used is 30 ksi, determine the most economical channels that can be used.

**SOLUTION**

Reaction:

\[ \Sigma M_D = 0: \quad -12A + 9(20) + (6)(2.25)(3) = 0 \]

- **B to C:** \[ V = 18.375 - 20 = -1.625 \text{ kips} \]

\[ V_D = -1.625 - (6)(2.25) = -15.125 \text{ kips} \]

Areas of shear diagram:

- **C to D:** \[ 0.5(-1.625 - 15.125) = -50.25 \text{ kip ft} \]

Bending moments:

$D$ to $E$: (9.5)(-39.7143) = -377.286 kip \cdot \text{ft}

Bending moments:

$M_C = 145.286 + 340 = 485.29 \text{ kip} \cdot \text{ft}$

PROBLEM 5.85

Determine the largest permissible value of $P$ for the beam and loading shown, knowing that the allowable normal stress is +6 ksi in tension and −18 ksi in compression.

SOLUTION

At section $B$:  For $\sigma_b = 18$ ksi (compression):

$$\sigma_b = M_b \frac{c_b}{I_{x'}}$$

$$18 = (4.6667P) \frac{0.66667}{1.41667} \quad P = 8.20 \text{ kips}$$
PROBLEM 5.85  (Continued)

For $\sigma_a = 6$ ksi (tension),

$$\sigma_a = M_b \frac{c_a}{I_x'}$$

$$6 = (4.6667P) \frac{1.83333}{1.41667} \quad P = 0.994 \text{ kips}$$

At section C:

For $\sigma_b = 6$ ksi (tension),

$$\sigma_b = M_c \frac{c_b}{I_x'} \quad 6 = (6P) \frac{0.66667}{1.41667} \quad P = 2.13 \text{ kips}$$

For $\sigma_a = 18$ ksi (Compression),

$$\sigma_a = M_c \frac{c_a}{I_x'} \quad 18 = (6P) \frac{1.83333}{1.41667} \quad P = 2.32 \text{ kips}$$

Choose smallest value of $P$: $P = 0.994 \text{ kips}$
PROBLEM 5.86

Determine the largest permissible value of $P$ for the beam and loading shown, knowing that the allowable normal stress is $+6$ ksi in tension and $-18$ ksi in compression.

SOLUTION

$$\bar{\sigma} = \frac{\sum A}{\sum A} = \frac{(1.5)(0.5)(2) + (0.25)(4)(0.5)}{(0.5)(2) + (4)(0.5)} = 0.6667 \text{ in.}$$

$$I = \sum \left( \frac{1}{12} bh^3 + Ad^2 \right)$$

$$= \frac{1}{12} (0.5)(2)^3 + (0.5)(2)(1.5 - 0.6667)^2 + \frac{1}{12} (4)(0.5)^3 + (4)(0.5)(0.6667 - 0.25)^2$$

$$= 1.4167 \text{ in}^4$$

$$\sigma_{\text{all}} = +6 \text{ ksi, } -18 \text{ ksi}$$

For $\sigma_a = 18$ ksi (compression),

$$\sigma_a = M_{\text{max}} \frac{c_a}{I_{x'}}$$

$$18 = (8P) \frac{1.83333}{1.4167} \quad P = 1.739 \text{ kips}$$

For $\sigma_b = 6$ ksi (tension),

$$\sigma_b = M_{\text{max}} \frac{c_b}{I_{x'}}$$

$$6 = (8P) \frac{0.6667}{1.4167} \quad P = 1.594 \text{ kips}$$

Choose smallest value of $P$: $P = 1.594 \text{ kips}$

PROBLEM 5.87

Determine the largest permissible distributed load \( w \) for the beam shown, knowing that the allowable normal stress is +80 MPa in tension and −130 MPa in compression.

SOLUTION

Reactions. By symmetry, \( B = C \)

\[ \sum F_y = 0 : B + C - 0.9w = 0 \]

\[ B = C = 0.45w \]

Shear:

\[ V_A = 0 \]

\[ V_{B^-} = 0 - 0.2w = -0.2w \]
\[ V_{B^+} = -0.2w + 0.45w = 0.25w \]
\[ V_{C^-} = 0.25w - 0.5w = -0.25w \]
\[ V_{C^+} = -0.25w + 0.45w = 0.2w \]
\[ V_D = 0.2w - 0.2w = 0 \]

Areas:

\[ A \text{ to } B. \quad \frac{1}{2}(0.2)(-0.2w) = -0.02w \]

\[ B \text{ to } E \quad \frac{1}{2}(0.25)(0.25w) = 0.03125w \]

Bending moments:

\[ M_A = 0 \]
\[ M_B = 0 - 0.02w = -0.02w \]
\[ M_E = -0.02w + 0.03125w = 0.01125w \]

Neglect the weight of both beams.

SOLUTION

(a)

\[ d = 8 \text{ ft} - \frac{l}{2} \quad l = 16 \text{ ft} - 2d \]  

Beam AB (Portion AC):

For W12 × 50, \( S_x = 64.2 \text{ in}^3 \) \( \sigma_{\text{all}} = 24 \text{ ksi} \)

\[ M_{\text{all}} = \sigma_{\text{all}} S_x = (24)(64.2) = 1540.8 \text{ kip \cdot in} = 128.4 \text{ kip \cdot ft} \]

\[ M_C = 27d = 128.4 \text{ kip \cdot ft} \quad d = 4.7556 \text{ ft} \]

Using (1),

\[ l = 16 - 2d = 16 - 2(4.7556) = 6.4888 \text{ ft} \]

\[ l = 6.49 \text{ ft} \]

(b)

Beam CD:

\( l = 6.4888 \text{ ft} \quad \sigma_{\text{all}} = 24 \text{ ksi} \)

\[ S_{\text{min}} = \frac{M_{\text{max}}}{\sigma_{\text{all}}} = \frac{(87.599 \times 12) \text{ kip \cdot in}}{24 \text{ ksi}} \]

PROBLEM 5.90

A uniformly distributed load of 66 kN/m is to be supported over the 6-m span shown. Knowing that the allowable normal stress for the steel used is 140 MPa, determine (a) the smallest allowable length $l$ of beam CD if the W460×74 beam AB is not to be overstressed, (b) the most economical $W$ shape that can be used for beam CD. Neglect the weight of both beams.

SOLUTION

For W460×74,

\[ S = 1460 \times 10^3 \text{ mm}^3 = 1460 \times 10^{-6} \text{ m}^3 \]

\[ \sigma_{\text{all}} = 140 \text{ MPa} = 140 \times 10^6 \text{ Pa} \]

\[ M_{\text{all}} = S \sigma_{\text{all}} = (1460 \times 10^{-6})(140 \times 10^6) = 204.4 \times 10^3 \text{ N} \cdot \text{m} = 204.4 \text{ kN} \cdot \text{m} \]

Reactions: By symmetry, \( A = B, \quad C = D \)

\[ +\sum F_y = 0: \quad A + B - (6)(66) = 0 \]
\[ A = B = 198 \text{ kN} = 198 \times 10^3 \text{ N} \]

\[ +\sum F_y = 0: \quad C + D - 66l = 0 \]
\[ C = D = (33l) \text{ kN} \]

(1)

Shear and bending moment in beam AB:

\[ 0 < x < a, \quad V = 198 - 66x \text{ kN} \]
\[ M = 198x - 33x^2 \text{ kN} \cdot \text{m} \]

At C, \( x = a \).

\[ M = M_{\text{max}} \]
\[ M = 198a - 33a^2 \text{ kN} \cdot \text{m} \]

Set \( M = M_{\text{all}} \).

\[ 198a - 33a^2 = 204.4 \]
\[ 33a^2 - 198a + 204.4 = 0 \]
\[ a = \frac{4.6751}{3} \text{ m}, \quad 1.32487 \text{ m} \]

(a) By geometry, \( l = 6 - 2a = 3.35 \text{ m} \)

From (1), \( C = D = 110.56 \text{ kN} \)

Draw shear and bending moment diagrams for beam CD. \( V = 0 \) at point E, the midpoint of CD.

$$M_E = 92.602 \text{ kN} \cdot \text{m} = 92.602 \times 10^3 \text{ N} \cdot \text{m}$$

$$S_{min} = \frac{M_E}{\sigma_{all}} = \frac{92.602 \times 10^3}{140 \times 10^6} = 661.44 \times 10^{-6} \text{ m}^3$$

PROBLEM 5.93

Beams $AB$, $BC$, and $CD$ have the cross section shown and are pin-connected at $B$ and $C$. Knowing that the allowable normal stress is $+110$ MPa in tension and $-150$ MPa in compression, determine ($a$) the largest permissible value of $P$ if beam $BC$ is not to be overstressed, ($b$) the corresponding maximum distance $a$ for which the cantilever beams $AB$ and $CD$ are not overstressed.

SOLUTION

$$M_B = M_C = 0$$
$$V_B = V_C = P$$

$$M_E = 0 + 2.4P = 2.4P = M_F$$

PROBLEM 5.94*

A bridge of length \( L = 48 \text{ ft} \) is to be built on a secondary road whose access to trucks is limited to two-axle vehicles of medium weight. It will consist of a concrete slab and of simply supported steel beams with an ultimate strength of \( \sigma_U = 60 \text{ ksi} \). The combined weight of the slab and beams can be approximated by a uniformly distributed load \( w = 0.75 \text{ kips/ft} \) on each beam. For the purpose of the design, it is assumed that a truck with axles located at a distance \( a = 14 \text{ ft} \) from each other will be driven across the bridge and that the resulting concentrated loads \( P_1 \) and \( P_2 \) exerted on each beam could be as large as 24 kips and 6 kips, respectively. Determine the most economical wide-flange shape for the beams, using LRFD with the load factors \( \gamma_D = 1.25, \gamma_L = 1.75 \) and the resistance factor \( \phi = 0.9 \). [Hint: It can be shown that the maximum value of \( |M_L| \) occurs under the larger load when that load is located to the left of the center of the beam at a distance equal to \( aP_2/2(P_1 + P_2) \).]

SOLUTION

\[
L = 48 \text{ ft} \quad a = 14 \text{ ft} \quad P_1 = 24 \text{ kips} \\
P_2 = 6 \text{ kips} \quad W = 0.75 \text{ kip/ft}
\]

Dead load:
\[
R_A = R_B = \left( \frac{1}{2} \right)(48)(0.75) = 18 \text{ kips}
\]

Area \( A \) to \( E \) of shear diagram:
\[
\left( \frac{1}{2} \right)(8)(18) = 216 \text{ kip} \cdot \text{ft}
\]

\[
M_{\text{max}} = 216 \text{ kip} \cdot \text{ft} = 2592 \text{ kip} \cdot \text{in} \text{ at point} \ E.
\]

Live load:
\[
u = \frac{aP_2}{2(P_1 + P_2)} = \frac{(14)(6)}{(2)(30)} = 1.4 \text{ ft}
\]

\[
x = \frac{L}{2} - u = 24 - 1.4 = 22.6 \text{ ft}
\]

\[
x + a = 22.6 + 14 = 36.6 \text{ ft}
\]

\[
L - x - a = 48 - 36.6 = 11.4 \text{ ft}
\]

\[
\sum M_B = 0: -48R_A + (25.4)(24) + (11.4)(6) = 0
\]

\[
R_A = 14.125 \text{ kips}

\[ D \text{ to } B: \quad V = -15.875 \text{ kips} \]

Area:

\[ A \text{ to } C: \quad (22.6)(14.125) = 319.225 \text{ kip} \cdot \text{ft} \]

Bending moment:

\[ M_C = 319.225 \text{ kip} \cdot \text{ft} = 3831 \text{ kip} \cdot \text{in} \]

Design:

\[ \gamma_D M_D + \gamma_L M_L = \phi M_U = \phi \sigma_U S_{\text{min}} \]

\[ S_{\text{min}} = \frac{\gamma_D M_D + \gamma_L M_L}{\phi \sigma_U} \]

\[ = \frac{(1.25)(2592) + (1.75)(3831)}{(0.9)(60)} \]

PROBLEM 5.95

Assuming that the front and rear axle loads remain in the same ratio as for the truck of Prob. 5.94, determine how much heavier a truck could safely cross the bridge designed in that problem.

PROBLEM 5.94∗ A bridge of length $L = 48$ ft is to be built on a secondary road whose access to trucks is limited to two-axle vehicles of medium weight. It will consist of a concrete slab and of simply supported steel beams with an ultimate strength of $\sigma_U = 60$ ksi. The combined weight of the slab and beams can be approximated by a uniformly distributed load $w = 0.75$ kips/ft on each beam. For the purpose of the design, it is assumed that a truck with axles located at a distance $a = 14$ ft from each other will be driven across the bridge and that the resulting concentrated loads $P_1$ and $P_2$ exerted on each beam could be as large as 24 kips and 6 kips, respectively. Determine the most economical wide-flange shape for the beams, using LRFD with the load factors $\gamma_D = 1.25$, $\gamma_L = 1.75$ and the resistance factor $\phi = 0.9$. [Hint: It can be shown that the maximum value of $|M_L|$ occurs under the larger load when that load is located to the left of the center of the beam at a distance equal to $aP_2/(2(P_1 + P_2))$.]

SOLUTION

For rolled steel section W27 × 84, $S = 213$ in$^3$

Allowable live load moment $M_L^*$:

$$M_L^* = \frac{\varphi \sigma_U S - \gamma_D M_D}{\gamma_L} = \frac{(0.9)(60)(213) - (1.25)(2592)}{1.75} = 4721 \text{ kip} \cdot \text{in}$$

Ratio:

$$\frac{M_L^*}{M_L} = \frac{4721}{3831} = 1.232 = 1 + 0.232$$

Increase 23.2%.
PROBLEM 5.96

A roof structure consists of plywood and roofing material supported by several timber beams of length \( L = 16 \) m. The dead load carried by each beam, including the estimated weight of the beam, can be represented by a uniformly distributed load \( w_D = 350 \) N/m. The live load consists of a snow load, represented by a uniformly distributed load \( w_L = 600 \) N/m, and a 6-kN concentrated load \( P \) applied at the midpoint \( C \) of each beam. Knowing that the ultimate strength for the timber used is \( \sigma_U = 50 \) MPa and that the width of the beam is \( b = 75 \) mm, determine the minimum allowable depth \( h \) of the beams, using LRFD with the load factors \( \gamma_D = 1.2, \gamma_L = 1.6 \) and the resistance factor \( \phi = 0.9 \).

SOLUTION

\( L = 16 \) m, \( w_D = 350 \) N/m = 0.35 kN/m

\( w_L = 600 \) N/m = 0.6 kN/m, \( P = 6 \) kN

Dead load:

\[ R_A = \left(\frac{1}{2}\right)(16)(0.35) = 2.8 \text{ kN} \]

Area \( A \) to \( C \) of shear diagram:

\[ \left(\frac{1}{2}\right)(8)(2.8) = 11.2 \text{ kN} \cdot \text{m} \]

Bending moment at \( C \):

\[ 11.2 \text{ kN} \cdot \text{m} = 11.2 \times 10^3 \text{ N} \cdot \text{m} \]

Live load:

\[ R_A = \frac{1}{2}[(16)(0.6) + 6] = 7.8 \text{ kN} \]

Shear at \( C^- \):

\[ V = 7.8 - (8)(0.6) = 3 \text{ kN} \]

Area \( A \) to \( C \) of shear diagram:

\[ \left(\frac{1}{2}\right)(8)(7.8 + 3) = 43.2 \text{ kN} \cdot \text{m} \]

Bending moment at \( C \):

\[ 43.2 \text{ kN} \cdot \text{m} = 43.2 \times 10^3 \text{ N} \cdot \text{m} \]

Design:

\[ \gamma_D M_D + \gamma_L M_L = \phi M_U = \phi \sigma_U S \]

\[ S = \frac{D M_D + \gamma_L M_L}{\phi \sigma_U} = \frac{(1.2)(11.2 \times 10^3) + (1.6)(43.2 \times 10^3)}{(0.9)(50 \times 10^6)} \]

\[ = 1.8347 \times 10^{-3} \text{ m}^3 = 1.8347 \times 10^6 \text{ mm}^3 \]

For a rectangular section, \( S = \frac{1}{6}bh^2 \)

\[ h = 383 \text{ mm} \]

PROBLEM 5.108

(a) Using singularity functions, write the equations for the shear and bending moment for the beam and loading shown. (b) Determine the maximum value of the bending moment in the beam.

SOLUTION

\[ \sum M = 0: \quad -14A + (12.5)(3)(3) + (7)(8) + (1.5)(3)(3) = 0 \]

\[ A = 13 \text{ kips} \uparrow \]

\[ w = 3 - 3(x - 3)^0 + 3(x - 11)^0 = -\frac{dV}{dx} \]

(a) \[ V = 13 - 3x + 3(x - 3)^1 - 8(x - 7)^0 - 3(x - 11)^1 \text{ kips} \]

\[ M = 13x - 1.5x^2 + 1.5(x - 3)^2 - 8(x - 7)^1 - 1.5(x - 11)^2 \text{ kip} \cdot \text{ft} \]

\[ V_C = 13 - (3)(3) = 4 \text{ kips} \]

\[ V_{D^+} = 13 - (3)(7) + (3)(4) = 4 \text{ kips} \]

\[ V_{D^-} = 13 - (3)(7) + (3)(4) - 8 = -4 \text{ kips} \]

\[ V_E = 13 - (3)(11) + (3)(8) - 8 = -4 \text{ kips} \]

\[ V_B = 13 - (3)(14) + (3)(11) - 8 - (3)(3) = -13 \text{ kips} \]

(b) Note that \( V \) changes sign at \( D \).

For rolled steel section W250×28.4, \( S = 308 \times 10^3 \text{ mm}^3 = 308 \times 10^{-6} \text{ m}^3 \)

(b) Normal stress:

\[ \sigma = \frac{|M|}{S} = \frac{27 \times 10^3}{308 \times 10^{-6}} = 87.7 \times 10^6 \text{ Pa} \]

PROBLEM 5.112

(a) Using singularity functions, find the magnitude and location of the maximum bending moment for the beam and loading shown. (b) Determine the maximum normal stress due to bending.

SOLUTION

\[ M = 0 : \ 18 - 3.6A + (1.2)(2.4)(40) - 27 = 0 \]
\[ A = 29.5 \text{kN} \uparrow \]
\[ V = 29.5 - 40(x - 1.2) \]
\[ \text{kN} \]

Point D, \[ V = 0 \]
\[ 29.5 - 40(x_D - 1.2) = 0 \]
\[ x_D = 1.9375 \text{ m} \]
\[ M = -18 + 29.5x - 20(x - 1.2)^2 \text{kN} \cdot \text{m} \]
\[ M = -18 \text{kN} \cdot \text{m} \]
\[ M_D = -18 + (29.5)(1.9375) - (20)(0.7375)^2 = 28.278 \text{kN} \cdot \text{m} \]
\[ M_E = -18 + (29.5)(3.6) - (20)(2.4)^2 = -27 \text{kN} \cdot \text{m} \]

\[ \sigma = 45.3 \text{ MPa} \]
PROBLEM 5.113

(a) Using singularity functions, find the magnitude and location of the maximum bending moment for the beam and loading shown. (b) Determine the maximum normal stress due to bending.

SOLUTION

\[ M_D = 0 : \quad (6)(10) - 5R_B + (2)(4)(80) = 0 \]

\[ R_B = 140 \text{ kN} \]

\[ w = 80(x - 2)^0 \text{ kN/m} = -dV/dx \]

\[ V = -10 + 140(x - 1)^0 - 80(x - 2)^1 \text{ kN} \]

\[ V = -10 \text{ kN} \]

For A to B:

\[ V = -10 + 140 = 130 \text{ kN} \]

For B to C:

\[ V = -10 + 140 = -10 \text{ kN} \]

For \( D \):\n
\[ (x = 6) \quad V = -10 + 140 - 80(4) = -190 \text{ kN} \]

\[ V \text{ changes sign at } B \text{ and at point } E \quad (x = x_E) \text{ between } C \text{ and } D. \]

\[ V = 0 = -10 + 140(x_E - 1)^0 - 80(x_E - 2)^1 \]

\[ = -10 + 140 - 80(x_E - 2) \quad x_E = 3.625 \text{ m} \]

\[ M = -10x + 140(x - 1)^1 - 40(x - 2)^2 \text{ kN} \cdot \text{m} \]

At pt. \( B \), \( x = 1 \)

\[ M_B = -(10)(1) = -10 \text{ kN} \cdot \text{m} \]

At pt. \( E \), \( x = 3.625 \)

\[ M_E = -(10)(3.625) + (140)(2.625) - (40)(1.625)^2 = 225.6 \text{ kN} \cdot \text{m} \]

\[ (a) \quad |M|_{\text{max}} = 225.6 \text{ kN} \cdot \text{m} \text{ at } x = 3.625 \text{ m} \]

For \( W530 \times 150 \),

\[ S = 3720 \times 10^3 \text{ mm}^3 = 3720 \times 10^{-6} \text{ m}^3 \]

\[ (b) \quad \text{Normal stress:} \quad \sigma = \frac{|M|}{S} = \frac{225.6 \times 10^3}{3720 \times 10^{-6}} = 60.6 \times 10^6 \text{ Pa} \]

\[ D = 28 \text{ kips} \uparrow \]

Check:

\[ +\sum F_y = 12 - 4 - 24 + 28 - 12 = 0 \checkmark \]

\[ V = 12 - 4(x - 4)^0 - 24(x - 8)^0 + 28(x - 16)^0 \]

\[ M = 12x - 4(x - 4)^1 - 24(x - 8)^1 + 28(x - 16)^1 \]

At A, \( x = 0 \), \( M = 0 \)
At B, \( x = 4 \text{ ft} \), \( M = (12)(4) = 48 \text{ kip} \cdot \text{ft} \)
At C, \( x = 8 \text{ ft} \), \( M = (12)(8) - (4)(4) = 80 \text{ kip} \cdot \text{ft} \)
At D, \( x = 16 \text{ ft} \), \( M = (12)(16) - (4)(12) - (24)(8) = -48 \text{ kip} \cdot \text{ft} \)
At E, \( x = 20 \text{ ft} \), \( M = (12)(20) - (4)(16) - (24)(12) + (28)(4) = 0 \) (checks)

\[ M = 40.5x - 1.5x^2 - 22.5(x - 3)^{\frac{1}{6}} \text{ kip} \cdot \text{ft} \]

(a) Location of point \( D \) where \( V = 0 \). Assume \( 3 \text{ ft} < x_D < 12 \text{ ft} \).

\[ 0 = 40.5 - 3x_D - 22.5 \quad x_D = 6 \text{ ft} \]

PROBLEM 5.116

A timber beam is being designed with supports and loads as shown. (a) Using singularity functions, find the magnitude and location of the maximum bending moment in the beam. (b) Knowing that the available stock consists of beams with an allowable stress of 12 MPa and a rectangular cross section of 30-mm width and depth $h$ varying from 80 mm to 160 mm in 10-mm increments, determine the most economical cross section that can be used.

SOLUTION

$$480 \text{ N/m} = 0.48 \text{ kN/m}$$

$$\sum M_C = 0: -4 R_D + (3)
\begin{pmatrix}
\frac{1}{2}
\end{pmatrix}
(1.5)(0.48) + (1.25)(2.5)(0.48) = 0$$

$$R_D = 0.645 \text{ kN}$$

$$w = \frac{0.48}{1.5} x - \frac{0.48}{1.5} (x - 1.5)^1 = 0.32x - 0.32(x - 1.5)^1 \text{ kN/m} = \frac{dV}{dx}$$

$$V = 0.645 - 0.16x^2 + 0.16(x - 1.5)^2 \text{ kN}$$

$$M = 0.645x - 0.05333x^3 + 0.05333(x - 1.5)^3 \text{ kN} \cdot \text{m}$$

(a) Locate point $D$ where $V = 0$.

Assume $1.5 \text{ m} < x_D < 4 \text{ m}$.

$$0 = 0.645 - 0.16x_D^2 + 0.16(x_D - 1.5)^2$$

$$= 0.645 - 0.16x_D^2 + 0.16x_D^2 - 0.48x_D + 0.36$$

$$x_D = 2.09375 \text{ m}$$

At point $D$,

$$M_D = (0.645)(2.09375) - (0.05333)(2.09375)^3 + (0.05333)(0.59375)^3$$

$$M_D = 0.87211 \text{ kN} \cdot \text{m}$$

$$S_{\min} = \frac{M_D}{\sigma_{all}} = \frac{0.87211 \times 10^3}{12 \times 10^6} = 72.6758 \times 10^{-6} \text{ m}^3 = 72.6758 \times 10^3 \text{ mm}^3$$

For a rectangular cross section, $S = \frac{1}{6}bh^2$

$$h = \frac{6S}{b}$$

$$h_{\min} = \sqrt[3]{\frac{(6)(72.6758 \times 10^3)}{30}} = 120.56 \text{ mm}$$

(b) At next larger 10-mm increment,

$$h = 130 \text{ mm}$$

\[ V = 0.880 - 0.5x + 0.104167(x - 1.6)^2 \text{kN} \]

\[ V_A = 0.880 \text{kN} \]

\[ V_B = 0.880 - (0.5)(1.6) = 0.080 \text{kN} \]

\[ V_C = 0.880 - (0.5)(4) + (0.104167)(2.4)^2 = -0.520 \text{kN} \]

Sign change

Locate point \( D \) (between \( B \) and \( C \)) where \( V = 0. \)

\[ 0 = 0.880 - 0.5x_D + 0.104167(x_D - 1.6)^2 \]

\[ 0.104167x_D^2 - 0.8333x_D + 1.14667 = 0 \]

\[ x_D = \frac{0.83333 \pm \sqrt{(0.83333)^2 - (4)(0.104167)(1.14667)}}{(2)(0.104167)} = 6.2342, \quad 1.7658 \text{ m} \]

\[ M = 0.880x - 0.25x^2 + 0.347222(x - 1.6)^3 \text{kN} \cdot \text{m} \]

\[ M_D = (0.880)(1.7658) - (0.25)(1.7658)^2 + (0.34722)(0.1658)^3 = 0.776 \text{kN} \cdot \text{m} \]

\( (a) \)

\[ M_{\text{max}} = 0.776 \text{kN} \cdot \text{m} \quad \text{at} \quad x = 1.7658 \text{ m} \]

\[ S_{\text{min}} = \frac{M_{\text{max}}}{\sigma_{\text{all}}} = \frac{0.776 \times 10^3}{12 \times 10^6} = 6.46 \times 10^{-6} \text{ m}^3 = 6.46 \times 10^3 \text{ mm}^3 \]

For a rectangular cross section, \( S = \frac{1}{6}bh^2 \)

\[ h = \frac{6S}{b} \]

\[ h_{\text{min}} = \sqrt{\frac{(6)(64.66 \times 10^3)}{30}} = 113.7 \text{ mm} \]

\( (b) \)

At next higher 10-mm increment, \( h = 120 \text{ mm} \)

Maximum $|M| = 3.804$ kip-ft = 45.648 kip-in at $x = 2.20$ ft

Rectangular section:

$$S = \frac{1}{6}bh^2 = \left(\frac{1}{6}\right)(2)(12)^2 = 48 \text{ in}^3$$

$$\sigma = \frac{M}{S} = \frac{45.648}{48} \quad \sigma = 0.951 \text{ ksi}$$
PROBLEM 5.125

For the beam and loading shown, and using a computer and step functions, (a) tabulate the shear, bending moment, and maximum normal stress in sections of the beam from \( x = 0 \) to \( x = L \), using the increments \( \Delta L \) indicated, (b) using smaller increments if necessary, determine with a 2% accuracy the maximum normal stress in the beam. Place the origin of the \( x \) axis at end \( A \) of the beam.

SOLUTION

\[
\sum M_B = 0: \quad -12.5 R_B + (12.5)(5.0)(4.8) + (5)(10)(3.2) = 0
\]

\[ R_B = 36.8 \text{ kips} \]

\[ w = 4.8 - 1.6(x - 5)^0 \text{ kips/ft} \]

\[ V = -4.8x + 36.8(x - 2.5)^0 + 1.6(x - 5)^1 \text{ kips} \]

\[ M = -2.4x^2 + 36.8(x - 2.5)^1 + 0.8(x - 5)^2 \text{ kip} \cdot \text{ft} \]

Maximum $|M| = 57.6 \text{ kip} \cdot \text{ft} = 691.2 \text{ kip} \cdot \text{in}$ at $x = 9.0 \text{ ft}$

For rolled steel section W12×30,

$$S = 38.6 \text{ in}^3$$

Maximum normal stress:

$$\sigma = \frac{M}{S} = \frac{691.2}{38.6}$$

$\sigma = 17.91 \text{ ksi}$
PROBLEM 5.126

The beam \( AB \), consisting of an aluminum plate of uniform thickness \( b \) and length \( L \), is to support the load shown. (a) Knowing that the beam is to be of constant strength, express \( h \) in terms of \( x \), \( L \), and \( h_0 \) for portion \( AC \) of the beam. (b) Determine the maximum allowable load if \( L = 800 \) mm, \( h_0 = 200 \) mm, \( b = 25 \) mm, and \( \sigma_{\text{all}} = 72 \) MPa.

SOLUTION

\[ R_A = R_B = \frac{P}{2} \]

\[ M = \frac{P_x}{2} \]

\[ S = \frac{M}{\sigma_{\text{all}}} = \frac{P_x}{2\sigma_{\text{all}}} \]

For a rectangular cross section, \( S = \frac{1}{6}bh^2 \)

Equating, \( \frac{1}{6}bh^2 = \frac{P_x}{2\sigma_{\text{all}}} \)

\( h = \frac{3P_x}{\sigma_{\text{all}}b} \)

(a) At \( x = \frac{L}{2} \),

\[ h = h_0 \sqrt{ \frac{3PL}{2\sigma_{\text{all}}b} } \]

For \( x > \frac{L}{2} \), replace \( x \) by \( L - x \).

(b) Solving for \( P \),

\[ P = \frac{2\sigma_{\text{all}}bh_0^2}{3L} = \frac{(2)(72\times10^6)(0.025)(0.200)^2}{(3)(0.8)} = 60\times10^3 \text{ N} \]

\( P = 60 \text{ kN} \)
**PROBLEM 5.127**

The beam $AB$, consisting of an aluminum plate of uniform thickness $b$ and length $L$, is to support the load shown. (a) Knowing that the beam is to be of constant strength, express $h$ in terms of $x$, $L$, and $h_0$ for portion $AC$ of the beam. (b) Determine the maximum allowable load if $L = 800$ mm, $h_0 = 200$ mm, $b = 25$ mm, and $\sigma_{all} = 72$ MPa.

**SOLUTION**

For $x > \frac{L}{2}$,

$$S = \frac{M}{\sigma_{all}} = \frac{M_0 x}{\sigma_{all} L}$$

For $x > \frac{L}{2}$, replace $x$ by $L - x$.

For a rectangular cross section,

$$S = \frac{1}{6}bh^2$$

Equating,

$$\frac{1}{6}bh^2 = \frac{M_0 x}{\sigma_{all} L} \quad h = \sqrt{\frac{6M_0 x}{\sigma_{all} bL}}$$

(a) At $x = \frac{L}{2}$,

$$h = h_0 = \sqrt{\frac{3M_0}{\sigma_{all} b^2}}$$

(b) Solving for $M_0$, $M_0 = \frac{\sigma_{all} bh_0^2}{3} = \frac{(72 \times 10^6)(0.025)(0.200)^2}{3} = 24 \times 10^3 \text{ N} \cdot \text{m}$

$$M_0 = 24 \text{ kN} \cdot \text{m}$$
PROBLEM 5.128

The beam $AB$, consisting of a cast-iron plate of uniform thickness $b$ and length $L$, is to support the load shown. (a) Knowing that the beam is to be of constant strength, express $h$ in terms of $x$, $L$, and $h_0$. (b) Determine the maximum allowable load if $L = 36$ in., $h_0 = 12$ in., $b = 1.25$ in., and $\sigma_{all} = 24$ ksi.

SOLUTION

For a rectangular cross section,

$$S = \frac{1}{6}bh^2$$

Equating,

$$\frac{1}{6}bh^2 = \frac{Px}{\sigma_{all}}$$

At $x = L$,

$$h = h_0$$

(a) Divide Eq. (1) by Eq. (2) and solve for $h$.

$$h = h_0 \left(\frac{x}{L}\right)^{\frac{1}{2}} \uparrow$$

(b) Solving for $P$,

$$P = \frac{\sigma_{all}bh_0^2}{6L} = \frac{(24)(1.25)(12)^2}{(6)(36)}$$

$$P = 20.0 \text{ kips} \uparrow$$
PROBLEM 5.129

The beam $AB$, consisting of a cast-iron plate of uniform thickness $b$ and length $L$, is to support the load shown. (a) Knowing that the beam is to be of constant strength, express $h$ in terms of $x$, $L$, and $h_0$. (b) Determine the maximum allowable load if $L = 36$ in., $h_0 = 12$ in., $b = 1.25$ in., and $\sigma_{all} = 24$ ksi.

SOLUTION

\[ \sum F_y = 0: \quad R_A + R_B - wL = 0 \]
\[ \sum M_A = 0: \quad \frac{wL}{2} x - w x^2 + M = 0 \]
\[ R_A = R_B = \frac{wL}{2} \]
\[ M = \frac{w}{2} x(L - x) \]

For a rectangular cross section, \[ S = \frac{1}{6} b h^2 \]

Equating, \[ \frac{1}{6} b h^2 = \frac{w x(L - x)}{2 \sigma_{all}} \]

(a) \hspace{1cm} h = h_0 = \left( \frac{3wL^2}{4\sigma_{all}b} \right)^{1/2} \hspace{1cm} h = h_0 \left( \frac{x}{L} \left( 1 - \frac{x}{L} \right) \right)^{1/2} \uparrow
d\hspace{0.5cm} \text{At } x = L/2, \]

(b) \hspace{1cm} w = \frac{4\sigma_{all}b h_0^2}{3L^2} = \frac{(4)(24)(1.25)(12)^2}{(3)(36)^2} \hspace{1cm} w = 4.44 \text{ kip/in} \uparrow
PROBLEM 5.130

The beam \( AB \), consisting of a cast-iron plate of uniform thickness \( b \) and length \( L \), is to support the distributed load \( w(x) \) shown. (a) Knowing that the beam is to be of constant strength, express \( h \) in terms of \( x, L, \) and \( h_0 \). (b) Determine the smallest value of \( h_0 \) if \( L = 750 \text{ mm} \), \( b = 30 \text{ mm} \), \( w_0 = 300 \text{ kN/m} \), and \( \sigma_{\text{all}} = 200 \text{ MPa} \).

SOLUTION

\[
\frac{dV}{dx} = -w = -\frac{w_0 x}{L} \\
V = -\frac{w_0 x^2}{2L} = \frac{dM}{dx} \\
M = -\frac{w_0 x^3}{6L} \\
S = \frac{|M|}{\sigma_{\text{all}}} = \frac{w_0 x^3}{6L\sigma_{\text{all}}}
\]

For a rectangular cross section, \( S = \frac{1}{6}bh^2 \)

Equating,
\[
\frac{1}{6}bh^2 = \frac{w_0 x^3}{6L\sigma_{\text{all}}} \\
h = \sqrt[3]{\frac{w_0 x^3}{\sigma_{\text{all}} bL}}
\]

At \( x = L, \)
\[
h = h_0 = \sqrt[3]{\frac{w_0 L^2}{\sigma_{\text{all}} b}}
\]

(a) \( h = h_0 \left( \frac{x}{L} \right)^{3/2} \)

Data: \( L = 750 \text{ mm} = 0.75 \text{ m}, \ b = 30 \text{ mm} = 0.030 \text{ m}\)
\( w_0 = 300 \text{ kN/m} = 300 \times 10^3 \text{ N/m}, \ \sigma_{\text{all}} = 200 \text{ MPa} = 200 \times 10^6 \text{ Pa}\)

(b) \( h_0 = \sqrt[3]{\frac{(300 \times 10^3)(0.75)^2}{(200 \times 10^6)(0.030)}} = 167.7 \times 10^{-3} \text{ m} \)
\( h_0 = 167.7 \text{ mm} \)
PROBLEM 5.131

The beam $AB$, consisting of a cast-iron plate of uniform thickness $b$ and length $L$, is to support the distributed load $w(x)$ shown. (a) Knowing that the beam is to be of constant strength, express $h$ in terms of $x$, $L$, and $h_0$. (b) Determine the smallest value of $h_0$ if $L = 750$ mm, $b = 30$ mm, $w_0 = 300$ kN/m, and $\sigma_{all} = 200$ MPa.

SOLUTION

\[
\frac{dV}{dx} = -w = -w_0 \sin \frac{\pi x}{2L}
\]

\[
V = \frac{2w_0 L}{\pi} \cos \frac{\pi x}{2L} + C_i
\]

$V = 0$ at $x = 0 \rightarrow C_i = \frac{2w_0 L}{\pi}$

\[
\frac{dM}{dx} = V = -\frac{2w_0 L}{\pi} \left(1 - \cos \frac{\pi x}{2L}\right)
\]

\[
M = -\frac{2w_0 L}{\pi} \left(x - \frac{2L}{\pi} \sin \frac{\pi x}{2L}\right)
\]

\[
|M| = \frac{2w_0 L}{\pi} \left(x - \frac{2L}{\pi} \sin \frac{\pi x}{2L}\right)
\]

\[
S = \frac{|M|}{\sigma_{all}} = \frac{2w_0 L}{\pi \sigma_{all}} \left(x - \frac{2L}{\pi} \sin \frac{\pi x}{2L}\right)
\]

For a rectangular cross section, \( S = \frac{1}{6} b h^2 \)

Equating,

\[
\frac{1}{6} b h^2 = \frac{2w_0 L}{\pi \sigma_{all}} \left(x - \frac{2L}{\pi} \sin \frac{\pi x}{2L}\right)
\]

\[
h = \left[ \frac{12w_0 L}{\pi \sigma_{all} b} \left(x - \frac{2L}{\pi} \sin \frac{\pi x}{2L}\right) \right]^{1/2}
\]

At $x = L$,

\[h = h_0 = \left[ \frac{12w_0 L^2}{\pi \sigma_{all} b} \left(1 - \frac{2}{\pi}\right) \right]^{1/2} = 1.178 \sqrt{\frac{w_0 L^2}{\pi \sigma_{all} b}}
\]

(a)

\[h = h_0 \left[ \frac{x}{L} - \frac{2}{\pi} \frac{\sin \frac{\pi x}{2L}}{\sin \frac{\pi}{2}} \right]^{1/2} = 1.659 \sqrt{\frac{x}{L} - \frac{2}{\pi} \frac{\sin \frac{\pi x}{2L}}{-1}}
\]

Data:

\[L = 750 \text{ mm} = 0.75 \text{ m}, \ b = 30 \text{ mm} = 0.030 \text{ m}
\]

\[w_0 = 300 \text{ kN/m} = 300 \times 10^3 \text{ N/m}, \ \sigma_{all} = 200 \text{ MPa} = 200 \times 10^6 \text{ Pa}
\]

(b)

\[h_0 = 1.178 \sqrt{\frac{(300 \times 10^3)(0.75)}{200 \times 10^6}(0.030)} = 197.6 \times 10^{-3} \text{ m}
\]

\[h_0 = 197.6 \text{ mm}
\]
**PROBLEM 5.132**

A preliminary design on the use of a simply supported prismatic timber beam indicated that a beam with a rectangular cross section 50 mm wide and 200 mm deep would be required to safely support the load shown in part a of the figure. It was then decided to replace that beam with a built-up beam obtained by gluing together, as shown in part b of the figure, four pieces of the same timber as the original beam and of 50x50-mm cross section. Determine the length \( l \) of the two outer pieces of timber that will yield the same factor of safety as the original design.

**SOLUTION**

\[ R_A = R_B = \frac{P}{2} \]

\[ 0 < x < \frac{1}{2} \]

\[ \sum M_x = 0: \quad -\frac{P}{2}x + M = 0 \]

\[ M = \frac{Px}{2} \quad \text{or} \quad M = \frac{M_{\text{max}}x}{1.2} \]

Bending moment diagram is two straight lines.

At \( C \),

\[ S_C = \frac{1}{6}bh_C^2 \quad M_C = M_{\text{max}} \]

Let \( D \) be the point where the thickness changes.

At \( D \),

\[ S_D = \frac{1}{6}bh_D^2 \quad M_D = \frac{M_{\text{max}}x_D}{1.2} \]

\[ \frac{S_D}{S_C} = \frac{h_D^2}{h_C^2} = \left( \frac{100 \text{ mm}}{200 \text{ mm}} \right)^2 = \frac{1}{4} = \frac{M_D}{M_C} = \frac{x_D}{1.2} \]

\[ x_D = 0.3 \text{ m} \]

\[ l = 1.800 \text{ m} \]

SOLUTION

\[
R_A = R_B = \frac{0.8 \text{ N}}{2} = 0.4w

Shear:

A to \( C \): \[ V = 0.4w \]

\( D \) to \( B \): \[ V = -0.4w \]

Areas:

A to \( C \): \[ (0.8)(0.4)w = 0.32w \]

Bending moments:

At \( C \), \[ M_C = 0.40w \]

A to \( C \):

\[ M = 0.40wx \]

At \( C \), \[ S_C = \frac{1}{6}bh_C^2 \]

\[ M_C = M_{\text{max}} = 0.40w \]

Let \( F \) be the point were the thickness changes.

At \( F \), \[ S_F = \frac{1}{6}bh_F^2 \]

\[ M_F = 0.40wx_F \]

\[
\frac{S_F}{S_C} = \frac{h_F^2}{h_C^2} = \left( \frac{100 \text{ mm}}{200 \text{ mm}} \right)^2 = \frac{1}{4} = \frac{M_F}{M_C} = \frac{0.40wx_F}{0.40w}
\]

\[ x_F = 0.25 \text{ m} \]

\[ \frac{l}{2} = 1.2 - x_F = 0.95 \text{ m} \]

\[ l = 1.900 \text{ m} \]

PROBLEM 5.134

A preliminary design on the use of a cantilever prismatic timber beam indicated that a beam with a rectangular cross section 2 in. wide and 10 in. deep would be required to safely support the load shown in part a of the figure. It was then decided to replace that beam with a built-up beam obtained by gluing together, as shown in part b of the figure, five pieces of the same timber as the original beam and of 2×2-in. cross section. Determine the respective lengths $l_1$ and $l_2$ of the two inner and outer pieces of timber that will yield the same factor of safety as the original design.

SOLUTION

At B, $|M|_B = M_{\text{max}}$

At C, $|M|_C = M_{\text{max}} \frac{x_C}{6.25}$

At D, $|M|_D = M_{\text{max}} \frac{x_D}{6.25}$

$S_B = \frac{1}{6}bh^2 = \frac{1}{6} \cdot b(5b)^2 = \frac{25}{6} b^3$

$A$ to $C$: $S_C = \frac{1}{6}b(b)^2 = \frac{1}{6}b^3$

$C$ to $D$: $S_D = \frac{1}{6}b(3b)^2 = \frac{9}{6}b^3$

\[
\begin{align*}
\frac{|M|_C}{|M|_B} &= \frac{x_C}{6.25} = \frac{S_C}{S_B} = \frac{1}{25} \quad x_C = \frac{(1)(6.25)}{25} = 0.25 \text{ ft} \\
\frac{|M|_D}{|M|_B} &= \frac{x_D}{6.25} = \frac{S_D}{S_B} = \frac{9}{25} \quad x_D = \frac{(9)(6.25)}{25} = 2.25 \text{ ft} \\
l_1 &= 6.25 - 0.25 \
l_1 &= 6.00 \text{ ft} \\
l_2 &= 6.25 - 2.25 \
l_2 &= 4.00 \text{ ft}

SOLUTION

\[
R_A = R_B = \frac{wL}{2}

\[ + \sum M_J = 0: \quad -\frac{wL}{2} x + wx \frac{x}{2} + M = 0 \]

\[ M = \frac{w}{2} x (L - x) \]

A machine element of cast aluminum and in the shape of a solid of revolution of variable diameter \( d \) is being designed to support the load shown. Knowing that the machine element is to be of constant strength, express \( d \) in terms of \( x \), \( L \), and \( d_0 \).

SOLUTION

Draw shear and bending moment diagrams.

For a solid circular section, \( c = \frac{1}{2} d \)

\[
I = \frac{\pi}{4} c^4 = \frac{\pi}{64} d^4
\]

\[
S = \frac{I}{c} = \frac{\pi}{32} d^3
\]

For constant strength design, \( \sigma = \text{constant}. \)

For \( 0 \leq x \leq \frac{L}{2}, \)

\[
M = \frac{P}{2} x
\]

\[
0 \leq x \leq \frac{L}{2}, \quad M = \frac{P}{2} \left( \frac{L}{2} - x \right)
\]

For \( \frac{L}{2} \leq x \leq L, \)

\[
M = \frac{P}{32} d^3
\]

At point \( C, \)

\[
\frac{P}{32} d^3 = \frac{P L}{4}
\]

Dividing Eq. (1a) by Eq. (2),

\[
0 \leq x \leq \frac{L}{2}, \quad \frac{d^3}{d_0^3} = \frac{2x}{L}

\[
d = d_0 \left( \frac{2x}{L} \right)^{3/2}
\]

Dividing Eq. (1b) by Eq. (2),

\[
\frac{L}{2} \leq x \leq L, \quad \frac{d^3}{d_0^3} = \frac{2(L - x)}{L}

A cantilever beam $AB$ consisting of a steel plate of uniform depth $h$ and variable width $b$ is to support the distributed load $w$ along its centerline $AB$. (a) Knowing that the beam is to be of constant strength, express $b$ in terms of $x$, $L$, and $b_0$.

(b) Determine the maximum allowable value of $w$ if $L = 15$ in., $b_0 = 8$ in., $h = 0.75$ in., and $\sigma_{all} = 24$ ksi.

**SOLUTION**

\[ \Sigma M_x = 0: \quad -M - w(L-x)\frac{L-x}{2} = 0 \]

\[ M = \frac{w(L-x)^2}{2} \quad |M| = \frac{w(L-x)^2}{2} \]

\[ S = \frac{|M|}{\sigma_{all}} = \frac{w(L-x)^2}{2\sigma_{all}} \]

For a rectangular cross section,

\[ S = \frac{1}{6}bh^2 \]

\[ \frac{1}{6}bh^2 = \frac{w(L-x)^2}{2\sigma_{all}} \quad b = \frac{3w(L-x)^2}{\sigma_{all}h^2} \]

(a) At

\[ x = 0, \quad b = b_0 = \frac{3wL^2}{\sigma_{all}h^2} \]

\[ b = b_0 \left( 1 - \frac{x}{L} \right)^2 \]

(b) Solving for $w$,

\[ w = \frac{\sigma_{all}b_0h^2}{3L^2} = \frac{(24)(8)(0.75)^2}{(3)(15)^2} = 0.160 \text{ kip/in} \]

\[ w = 160.0 \text{ lb/in} \]
PROBLEM 5.139

A cantilever beam $AB$ consisting of a steel plate of uniform depth $h$ and variable width $b$ is to support the concentrated load $P$ at point $A$. (a) Knowing that the beam is to be of constant strength, express $b$ in terms of $x$, $L$, and $b_0$. (b) Determine the smallest allowable value of $h$ if $L = 300$ mm, $b_0 = 375$ mm, $P = 14.4$ kN, and $\sigma_{all} = 160$ MPa.

SOLUTION

\[ + \sum M_j = 0: \quad -M - P(L - x) = 0 \]
\[ M = -P(L - x) \]
\[ |M| = P(L - x) \]
\[ S = \frac{|M|}{\sigma_{all}} = \frac{P(L - x)}{\sigma_{all}} \]

For a rectangular cross section,
\[ S = \frac{1}{6}bh^2 \]

Equating,
\[ \frac{1}{6}bh^2 = \frac{P(L - x)}{\sigma_{all}} \quad b = \frac{6PL}{\sigma_{all}h^2} \]

(a) At $x = 0$,
\[ b = b_0 - \frac{6PL}{\sigma_{all}h^2} \]

Solving for $h$,
\[ h = \frac{6PL}{\sqrt{\sigma_{all}b_0}} \]

Data:
- $L = 300$ mm $= 0.300$ m, $b_0 = 375$ mm $= 0.375$ m
- $P = 14.4$ kN $= 14.4 \times 10^3$ N $\cdot$ m, $\sigma_{all} = 160$ MPa $= 160 \times 10^6$ Pa

(b) $h = \frac{\sqrt{6(14.4 \times 10^3)(0.300)}}{(160 \times 10^6)(0.375)} = 20.8 \times 10^{-3}$ m

$h = 20.8$ mm
PROBLEM 5.140

Assuming that the length and width of the cover plates used with the beam of Sample Prob. 5.12 are, respectively, \( l = 4 \) m and \( b = 285 \) mm, and recalling that the thickness of each plate is 16 mm, determine the maximum normal stress on a transverse section (a) through the center of the beam, (b) just to the left of \( D \).

SOLUTION

At center of beam, \( x = 4 \) m \( M_C = (250)(4) = 1000 \) kN \( \cdot \) m

At \( D \), \( x = \frac{1}{2}(8 - l) = \frac{1}{2}(8 - 4) = 2 \) m \( M_0 = 500 \) kN \( \cdot \) m

At center of beam, \( I = I_{\text{beam}} + 2I_{\text{plate}} \)

\[
I = 1190 \times 10^6 + 2 \left\{ (285)(16) \left( \frac{678}{2} + \frac{16}{2} \right)^2 + \frac{1}{12} (285)(16)^3 \right\}

\[

\[
c = \frac{678}{2} + 16 = 355 \text{ mm} \quad S = \frac{I}{c} = 6445 \times 10^3 \text{ mm}^3

\[

(a) Normal stress: \( \sigma = \frac{M}{S} = \frac{1000 \times 10^3}{6445 \times 10^{-6}} = 155.2 \times 10^6 \) Pa \( \sigma = 155.2 \) MPa \( \uparrow \)

At \( D \), \( S = 3490 \times 10^3 \text{ mm}^3 = 3510 \times 10^{-6} \text{ m}^3 \)

(b) Normal stress: \( \sigma = \frac{M}{S} = \frac{500 \times 10^3}{3490 \times 10^{-6}} = 143.3 \times 10^6 \) Pa \( \sigma = 143.3 \) MPa \( \uparrow \)

Plate: \( A = (18)(220) = 3960 \text{ mm}^2 \quad d = 208.5 + \left(\frac{1}{2}\right)(18) = 217.5 \text{ mm} \)

\[ \bar{T} = \frac{1}{12}(220)(18)^3 = 106.92 \times 10^3 \text{ mm}^4 \quad Ad^2 = 187.333 \times 10^6 \text{ mm}^4 \]

\[ I_s = \bar{T} + Ad^2 = 187.440 \times 10^6 \text{ mm}^4 \]

For section, \( I = 316 \times 10^6 + (2)(187.440 \times 10^6) = 690.88 \times 10^6 \text{ mm}^4 \)

\( c = 208.5 + 18 = 226.5 \text{ mm} \)

\[ S = \frac{I}{c} = \frac{690.88 \times 10^6}{226.5} = 3050.2 \times 10^3 \text{ mm}^3 = 3050.2 \times 10^{-6} \text{ m}^3 \]

SOLUTION

For W30 \( \times \) 99 rolled steel section, \( S = 269 \text{ in}^3 \)

To locate points \( D \) and \( E \), set \( M = M_{\text{all}} \).

\[
240x - 15x^2 = 493.167 \quad 15x^2 - 240x + 493.167 = 0

For the tapered beam shown, determine (a) the transverse section in which the maximum normal stress occurs, (b) the largest distributed load \( w \) that can be applied, knowing that \( \sigma_{\text{all}} = 140 \text{ MPa} \).

SOLUTION

\[ R_A = R_B = \frac{1}{2} wL \uparrow \quad L = 1.2 \text{ m} \]

\[ \Sigma M_j = 0: \quad -\frac{1}{2} wL + wx\frac{x}{2} + M = 0 \]

\[ M = \frac{w}{2} (Lx - x^2) \]

\[ = \frac{w}{2} x(L - x) \]

For the tapered beam,

\[ h = a + kx \]

\[ a = 120 \text{ mm} \]

\[ k = \frac{300 - 120}{0.6} = 300 \text{ mm/m} \]

For rectangular cross section,

\[ S = \frac{1}{6} bh^2 = \frac{1}{6} b(a + kx)^2 \]

Bending stress:

\[ \sigma = \frac{M}{S} = \frac{3w}{b} \frac{Lx - x^2}{(a + kx)^2} \]

To find location of maximum bending stress, set \( \frac{d\sigma}{dx} = 0 \).

\[ \frac{d\sigma}{dx} = \frac{3w}{b} \frac{d}{dx} \left( \frac{Lx - x^2}{(a + kx)^2} \right) = \frac{3w}{b} \left( \frac{(a + kx)(L - 2x) - 2k(Lx - x^2)}{(a + kx)^3} \right) \]

\[ = \frac{3w}{b} \left( \frac{aL + kLx - 2ax - 2kx^2 - 2kLx + 2kx^2}{(a + kx)^3} \right) \]

\[ = \frac{3w}{b} \left( \frac{aL - (2a + kL)x}{(a + kx)^3} \right) = 0 \]

Determine (a) the distance \( a \) for which the maximum absolute value of the bending moment in the beam is as small as possible, (b) the corresponding maximum normal stress due to bending. (See hint of Prob. 5.27.)

SOLUTION

Reaction at \( B \):

\[ \sum M_C = 0: \quad 5a - (8)(10) + 13R_B = 0 \]

\[ R_B = \frac{1}{18} (80 - 5a) \]

Equate:

\[ -M_C = M_D \]

\[ 5a = \frac{5}{13} (80 - 5a) \]

\[ a = 4.4444 \text{ ft} \]

Then

\[ \sum M_B = 0: \quad -2.5A + (1.75)(1.5)(16) = 0 \]
\[ A = 16.8 \text{ kN} \]

\[ \sum M_A = 0: \quad -(0.75) + (1.5)(16) + 2.5B = 0 \]

\[ V_C = 16.8 - (1.5)(16) = -7.2 \text{ kN} \]
\[ V_B = -7.2 \text{ kN} \]

Locate point \( D \) where \( V = 0 \).

\[ M_C = 8.82 - 1.62 = 7.2 \text{ kN} \cdot \text{m} \]
\[ M_B = 7.2 - 7.2 = 0 \]

Maximum \(|M| = 8.82 \text{ kN} \cdot \text{m} = 8.82 \times 10^3 \text{ N} \cdot \text{m} \)

For SI50×18.6 rolled steel section, \( S = 120 \times 10^3 \text{ mm}^3 = 120 \times 10^{-6} \text{ m}^3 \)

Normal stress:

PROBLEM 5.158

For the beam and loading shown, design the cross section of the beam, knowing that the grade of timber used has an allowable normal stress of 1750 psi.

SOLUTION

For equilibrium, \( B = E = 2.8 \) kips

Shear diagram:
- \( A \) to \( B^- \): \( V = -4.8 \) kips
- \( B^- \) to \( C^- \): \( V = -4.8 + 2.8 = -2 \) kips
- \( C^- \) to \( D^- \): \( V = -2 + 2 = 0 \)
- \( D^- \) to \( E^- \): \( V = 0 + 2 = 2 \) kips
- \( E^- \) to \( F \): \( V = 2 + 2.8 = 4.8 \) kips

Areas of shear diagram:
- \( A \) to \( B \): \( (2)(-4.8) = -9.6 \text{ kip} \cdot \text{ft} \)
- \( B \) to \( C \): \( (2)(-2) = -4 \text{ kip} \cdot \text{ft} \)
- \( C \) to \( D \): \( (3)(0) = 0 \)
- \( D \) to \( E \): \( (2)(2) = 4 \text{ kip} \cdot \text{ft} \)
- \( E \) to \( F \): \( (2)(4.8) = 9.6 \text{ kip} \cdot \text{ft} \)

Bending moments:
- \( M_A = 0 \)
- \( M_B = 0 - 9.6 = -9.6 \text{ kip} \cdot \text{ft} \)
- \( M_C = -9.6 - 4 = -13.6 \text{ kip} \cdot \text{ft} \)
- \( M_D = -13.6 + 0 = -13.6 \text{ kip} \cdot \text{ft} \)
- \( M_E = -13.6 + 4 = -9.6 \text{ kip} \cdot \text{ft} \)
- \( M_F = -9.6 + 9.6 = 0 \)

\( |M|_{\text{max}} = 13.6 \text{ kip} \cdot \text{ft} = 162.3 \text{ kip} \cdot \text{in} = 162.3 \times 10^3 \text{ lb} \cdot \text{in} \)

Required value for \( S \):

\[
S = \frac{|M|_{\text{max}}}{\sigma_{\text{all}}} = \frac{162.3 \times 10^3}{1750} = 93.257 \text{ in}^3
\]

For a rectangular section, \( I = \frac{1}{12}bh^3, \ c = \frac{1}{2}h, \ S = \frac{I}{c} = \frac{bh^2}{6} = \frac{(b)(9.5)^2}{6} = 15.0417b \)

Equating the two expressions for \( S \), \( 15.0417b = 93.257 \)

\( b = 6.20 \) in.
**PROBLEM 5.159**

Knowing that the allowable stress for the steel used is 160 MPa, select the most economical wide-flange beam to support the loading shown.

**SOLUTION**

\[ + \sum M_D = 0: \quad -3.2B + (24)(3.2)(50) = 0 \quad B = 120 \text{ kN} \]

\[ + \sum M_B = 0: \quad 3.2D - (0.8)(3.2)(50) = 0 \quad D = 40 \text{ kN} \]

Shear:

\[ V_A = 0 \]
\[ V_B = 0 - (0.8)(50) = -40 \text{ kN} \]
\[ V_B' = -40 + 120 = 80 \text{ kN} \]
\[ V_C = 80 - (2.4)(50) = -40 \text{ kN} \]
\[ V_D = -40 + 0 = -40 \text{ kN} \]

Locate point \( E \) where \( V = 0 \).

\[
\frac{e}{80} = \frac{2.4 - e}{40} \quad 120e = 192 \quad e = 1.6 \text{ m} \quad 2.4 - e = 0.8 \text{ m}
\]

Areas:

\[ A \text{ to } B: \quad \int Vdx = \frac{1}{2}(0.8)(-40) = -16 \text{ kN} \cdot \text{m} \]

\[ B \text{ to } E: \quad \int Vdx = \frac{1}{2}(1.6)(80) = 64 \text{ kN} \cdot \text{m} \]

\[ C \text{ to } D: \quad \int Vdx = (0.8)(-40) = -32 \text{ kN} \cdot \text{m} \]

Bending moments:

\[ M_A = 0 \]
\[ M_B = 0 - 16 = -16 \text{ kN} \cdot \text{m} \]
\[ M_E = -16 + 64 = 48 \text{ kN} \cdot \text{m} \]
\[ M_C = 48 - 16 = 32 \text{ kN} \cdot \text{m} \]
\[ M_D = 32 - 32 = 0 \]
PROBLEM 5.159 (Continued)

Maximum |\(M| = 48 \text{kN} \cdot \text{m} = 48 \times 10^3 \text{N} \cdot \text{m}

\[\sigma_{\text{all}} = 160 \text{ MPa} = 160 \times 10^6 \text{ Pa}\]

\[S_{\text{min}} = \frac{|M|}{\sigma_{\text{all}}} = \frac{48 \times 10^3}{160 \times 10^6} = 300 \times 10^{-6} \text{ m}^3 = 300 \times 10^3 \text{ mm}^3\]

PROBLEM 5.160

Determine the largest permissible value of $P$ for the beam and loading shown, knowing that the allowable normal stress is $+8$ ksi in tension and $-18$ ksi in compression.

SOLUTION

Reactions:  \[ B = D = 1.5 \, P \]

Shear diagram:

- From $A$ to $B^+$: $V = -P$
- From $B^+$ to $C^-$: $V = -P + 1.5 \, P = 0.5 \, P$
- From $C^+$ to $D^-$: $V = 0.5 \, P - P = -0.5 \, P$
- From $D^+$ to $E$: $V = -0.5 \, P + 1.5 \, P = P$

Areas:

- From $A$ to $B$: \((10)(-P) = -10 \, P\)
- From $B$ to $C$: \((60)(0.5 \, P) = 30 \, P\)
- From $C$ to $D$: \((60)(-0.5 \, P) = -30 \, P\)
- From $D$ to $E$: \((10)(P) = 10 \, P\)

Bending moments:

- $M_A = 0$
- $M_B = 0 - 10 \, P = -10 \, P$
- $M_C = -10 \, P + 30 \, P = 20 \, P$
- $M_D = 20 \, P - 30 \, P = -10 \, P$
- $M_E = -10 \, P + 10 \, P = 0$

Largest positive bending moment: $20 \, P$

Largest negative bending moment: $-10 \, P$

Centroid and moment of inertia:

Bottom. comp.:  \[ -18 = - \frac{(-10 P)(-1.75)}{37.25} \quad P = 38.3 \text{ kips} \]

PROBLEM 5.161

(a) Using singularity functions, find the magnitude and location of the maximum bending moment for the beam and loading shown. (b) Determine the maximum normal stress due to bending.

SOLUTION

\[ +\sum M_B = 0: -4.5 A + (2.25)(4.5)(40) + (2.7)(60) + (0.9)(60) = 0 \]

\[ A = 138 \text{ kN} \uparrow \]

\[ +\sum M_A = 0: -(2.25)(4.5)(40) - (1.8)(60) - (3.6)(60) + 4.5 B = 0 \]

\[ B = 162 \text{ kN} \uparrow \]

\[ w = 40 \text{ kN/m} = \frac{dV}{dx} \]

\[ V = -40x + 138 - 60(x-1.8)^0 - 60(x-3.6)^0 = \frac{dM}{dx} \]

\[ M = -20x^2 - 138x - 60(x-1.8)^1 - 60(x-3.6)^1 \]

\[ V_C^+ = -(40)(1.8) + 138 - 60 = 6 \text{ kN} \]

\[ V_D^- = -(40)(3.6) + 138 - 60 = -66 \text{ kN} \]

Locate point \( E \) where \( V = 0 \). It lies between \( C \) and \( D \).

\[ V_E = -40x_E + 138 - 60 + 0 = 0 \quad x_E = 1.95 \text{ m} \]

\[ M_E = -(20)(1.95)^2 + (138)(1.95) - (60)(1.95 - 1.8) = 184 \text{ kN} \cdot \text{m} \]

\( |M|_{\text{max}} = 184 \text{ kN} \cdot \text{m} = 184 \times 10^3 \text{ N} \cdot \text{m} \) at \( x = 1.950 \text{ m} \)

For W530×66 rolled steel section, \( S = 1340 \times 10^3 \text{ mm}^3 = 1340 \times 10^{-6} \text{ m}^3 \)

\( (b) \) Normal stress:

\[ \sigma = \frac{|M|_{\text{max}}}{S} = \frac{184 \times 10^3}{1340 \times 10^{-6}} = 137.3 \times 10^6 \text{ Pa} \]

\( \sigma = 137.3 \text{ MPa} \)
PROBLEM 5.162

The beam \( AB \), consisting of an aluminum plate of uniform thickness \( b \) and length \( L \), is to support the load shown. (a) Knowing that the beam is to be of constant strength, express \( h \) in terms of \( x \), \( L \), and \( h_0 \) for portion \( AC \) of the beam. (b) Determine the maximum allowable load if \( L = 800 \text{ mm} \), \( h_0 = 200 \text{ mm} \), \( b = 25 \text{ mm} \), and \( \sigma_{\text{all}} = 72 \text{ MPa} \).

SOLUTION

By symmetry, \( A = B \)

\[ + \sum F_y = 0: \quad A - \frac{1}{2} w_0 L + B = 0 \quad A = B = \frac{1}{4} w_0 L \uparrow \]

For \( 0 \leq x \leq \frac{L}{2} \),

\[ w = \frac{2 w_0 x}{L} \quad \frac{dV}{dx} = -w = \frac{2 w_0 x}{L} \quad V = C_1 - \frac{w_0 x^2}{L} \]

At \( x = 0 \),

\[ V = \frac{1}{4} w_0 L: \quad C_1 = \frac{1}{4} w_0 L \]

\[ \frac{dM}{dx} = V = \frac{1}{4} w_0 L - \frac{w_0 x^2}{L} \quad M = C_2 + \frac{1}{4} w_0 L x - \frac{1}{3} \frac{w_0 x^3}{L} \]

At \( x = 0 \),

\[ M = 0: \quad C_2 = 0 \]

\[ M = \frac{1}{2} \frac{w_0}{L} (3L^2 - 4x^3) \]

(a) At \( x = \frac{L}{2} \),

\[ M = M_C = \frac{1}{12} \frac{w_0}{L} \left[ 3L^2 \left( \frac{L}{2} \right) - 4 \left( \frac{L}{2} \right)^3 \right] = \frac{1}{12} \frac{w_0}{L} L^2 \]

For constant strength,

\[ S = \frac{M}{\sigma_{\text{all}}} \quad S_0 = \frac{M_0}{\sigma_{\text{all}}} = \frac{M_C}{\sigma_{\text{all}}} \quad \frac{S}{S_0} = \frac{M}{M_0} = \frac{1}{L} (3L^2 x - 4x^3) \]

For a rectangular section,

\[ S = \frac{1}{6} bh^2 \quad S_0 = \frac{1}{6} b h_0^2 \quad \frac{S}{S_0} = \left( \frac{h}{h_0} \right)^2 \]

\[ h = h_0 \sqrt{\frac{3L^2 x - 4x^3}{L^3}} \]

(b) Data:

\[ L = 800 \text{ mm} \quad h_0 = 200 \text{ mm} \quad b = 25 \text{ mm} \quad \sigma_{\text{all}} = 72 \text{ MPa} \]

\[ S_0 = \frac{1}{6} b h_0^2 = \frac{1}{6} (25)(200)^2 = 166.667 \times 10^3 \text{ mm}^3 = 166.667 \times 10^{-6} \text{ m}^3 \]

\[ M_C = \sigma_{\text{all}} S_0 = (72 \times 10^6)(166.667 \times 10^{-6}) = 12 \times 10^3 \text{ N} \cdot \text{m} \]

\[ w_0 = \frac{12 M_C}{L^2} = \frac{(12)(12 \times 10^3)}{(0.800)^2} = 225 \times 10^3 \text{ N/m} \]

\[ w_0 = 225 \text{ kN/m} \]
PROBLEM 5.163

A transverse force \( P \) is applied as shown at end \( A \) of the conical taper \( AB \). Denoting by \( d_0 \) the diameter of the taper at \( A \), show that the maximum normal stress occurs at point \( H \), which is contained in a transverse section of diameter \( d = 1.5d_0 \).

SOLUTION

\[
V = -P = \frac{dM}{dx} \quad M = -P_x
\]

Let

\[
d = d_0 + kx
\]

For a solid circular section,

\[
I = \frac{\pi c^4}{4} = \frac{\pi}{64} d^3
\]

\[
c = \frac{d}{2} \quad S = \frac{I}{c} = \frac{\pi}{32} d^3 = \frac{\pi}{32} (d_0 + kx)^3
\]

\[
dS = \frac{3\pi}{32} (d_0 + kx)^2 k = \frac{3\pi}{32} d^2 k
\]

Stress:

\[
\sigma = \frac{|M|}{S} = \frac{P_x}{S}
\]

At \( H \),

\[
\frac{d\sigma}{dx} = \frac{1}{S^2} \left( PS - P_x^2 \frac{dS}{dx} \right) = 0
\]

\[
S - x_H \frac{dS}{dx} = \frac{\pi}{32} d^3 - x_H \frac{3\pi}{32} d^2 k
\]

\[
kx_H = \frac{1}{3} d = \frac{1}{3} (d_0 + kx_H) \quad kx_H = \frac{1}{2} d_0
\]

\[
d = d_0 + \frac{1}{2} d_0 = \frac{3}{2} d_0
\]

\( d = 1.5d_0 \)

PROBLEM 6.1

Three boards, each of 1.5 × 3.5-in. rectangular cross section, are nailed together to form a beam that is subjected to a vertical shear of 250 lb. Knowing that the spacing between each pair of nails is 2.5 in., determine the shearing force in each nail.

SOLUTION

\[ I = \frac{1}{12}bh^3 = \frac{1}{12}(3.5)(4.5)^3 = 26.578 \text{ in}^4 \]

\[ A = (3.5)(1.5) = 5.25 \text{ in}^2 \]

Three boards, each 2 in. thick, are nailed together to form a beam that is subjected to a vertical shear. Knowing that the allowable shearing force in each nail is 150 lb, determine the allowable shear if the spacing s between the nails is 3 in.

SOLUTION

\[
I_1 = \frac{1}{12}bh^3 + Ad^2
\]
\[

\]
\[
I_2 = \frac{1}{12}bh^3 = \frac{1}{12}(2)(4)^3 = 10.667 \text{ in}^4
\]
\[
I_3 = I_1 = 112 \text{ in}^4
\]
\[
I = I_1 + I_2 + I_3 = 234.667 \text{ in}^4

\[
Q = Aq_y = (6)(2)(3) = 36 \text{ in}^3
\]
\[
qs = F_{\text{nail}} \quad (1)
\]
\[

\[
V = \frac{F_{\text{nail}}I}{Qs} = \frac{(150)(234.667)}{(36)(3)}

$A_{\text{bolt}} = \frac{\pi}{4} d_{\text{bolt}}^2 = \frac{\pi}{4}(18 \times 10^{-3})^2 = 254.47 \times 10^{-6} \text{m}^2$

$F_{\text{bolt}} = \tau_{\text{all}} A_{\text{bolt}} = (90 \times 10^6)(254.47 \times 10^{-6}) = 22.902 \times 10^3 \text{N}$

$q_s = 2F_{\text{bolt}}$  $q = \frac{2F_{\text{bolt}}}{s} = \frac{(2)(22.903 \times 10^3)}{120 \times 10^{-3}} = 381.7 \times 10^3 \text{N/m}$

$q = \frac{VQ}{I}$  $\nu = \frac{Iq}{Q} = \frac{(215.94 \times 10^{-6})(381.7 \times 10^3)}{380.4 \times 10^{-6}} = 217 \times 10^3 \text{N}$

PROBLEM 6.7

A column is fabricated by connecting the rolled-steel members shown by bolts of \( \frac{3}{4} \)-in. diameter spaced longitudinally every 5 in. Determine the average shearing stress in the bolts caused by a shearing force of 30 kips parallel to the \( y \) axis.

SOLUTION

Geometry:

\[
\begin{align*}
  f &= \left( \frac{d}{2} \right)_s + (t_w)_{C} \\
  &= \frac{10.0}{2} + 0.303 = 5.303 \text{ in.} \\
  \bar{x} &= 0.534 \text{ in.} \\
  \bar{y}_i &= f - \bar{x} = 5.303 - 0.534 = 4.769 \text{ in.}
\end{align*}
\]

Determine moment of inertia.

\[
\begin{array}{c|c|c|c|c}
\text{Part} & A (\text{in}^2) & d (\text{in.}) & Ad^2 (\text{in}^4) & T (\text{in}^4) \\
\hline
\text{C8} \times 13.7 & 4.04 & 4.769 & 91.88 & 1.52 \\
\text{S10} \times 25.4 & 7.4 & 0 & 0 & 123 \\
\text{C8} \times 13.7 & 4.04 & 4.769 & 91.88 & 1.52 \\
\Sigma & & & 183.76 & 126.04 \\
\end{array}
\]

\[
I = \Sigma Ad^2 + \Sigma T = 183.76 + 126.04 = 309.8 \text{ in}^4
\]

\[
Q = A \bar{y}_i = (4.04)(4.769) = 19.267 \text{ in}^3
\]

\[
q = \frac{VQ}{I} = \frac{(30)(19.267)}{309.8} = 1.8658 \text{ kip/in}
\]

\[
F_{\text{bolt}} = \frac{1}{2} q s = \left( \frac{1}{2} \right)(1.8658)(5) = 4.664 \text{ kips}
\]

\[
A_{\text{bolt}} = \frac{\pi}{4} d_{\text{bolt}}^2 = \frac{\pi}{4} \left( \frac{3}{4} \right)^2 = 0.4418 \text{ in}^2
\]

\[
\tau_{\text{bolt}} = \frac{F_{\text{bolt}}}{A_{\text{bolt}}} = \frac{4.664}{0.4418} = 10.56 \text{ ksi}
\]

\( \tau_{\text{bolt}} = 10.56 \text{ ksi} \)
PROBLEM 6.8

The composite beam shown is fabricated by connecting two W6 × 20 rolled-steel members, using bolts of \( \frac{5}{8} \)-in. diameter spaced longitudinally every 6 in. Knowing that the average allowable shearing stress in the bolts is 10.5 ksi, determine the largest allowable vertical shear in the beam.

SOLUTION

W6 × 20: \( A = 5.87 \text{ in}^2 \), \( d = 6.20 \text{ in.} \), \( I_x = 41.4 \text{ in}^4 \)

\[
\bar{y} = \frac{1}{2} d = 3.1 \text{ in.}
\]

Composite:

\[
I = 2[41.4 + (5.87)(3.1)^2] = 195.621 \text{ in}^4
\]

\[
Q = A\bar{y} = (5.87)(3.1) = 18.197 \text{ in}^3
\]

Bolts:

\( d = \frac{5}{8} \text{ in.}, \quad \tau_{\text{all}} = 10.5 \text{ ksi}, \quad s = 6 \text{ in.} \)

\[
A_{\text{bolt}} = \frac{\pi}{4} \left( \frac{5}{8} \right)^2 = 0.30680 \text{ in}^2
\]

\[
F_{\text{bolt}} = \tau_{\text{all}} A_{\text{bolt}} = (10.5)(0.30680) = 3.2214 \text{ kips}
\]

\[
q = \frac{2F_{\text{bolt}}}{s} = \frac{2(3.2214)}{6} = 1.07380 \text{ kips/in}
\]

Shear:

\[
q = \frac{VQ}{I} \quad V = \frac{Iq}{Q} = \frac{(195.621)(1.0780)}{18.197} = 11.54 \text{ kips}
\]
PROBLEM 6.9

For the beam and loading shown, consider section n-n and determine (a) the largest shearing stress in that section, (b) the shearing stress at point a.

SOLUTION

By symmetry, $R_A = R_B$.

\[ + \sum F_y = 0: \]

\[ R_A + R_B - 15 - 20 - 15 = 0 \]

\[ R_A = R_B = 25 \text{ kips} \]

From shear diagram, $V = 30 \text{ kips}$ at n-n.

Determine moment of inertia.

\[ I = \sum A d^2 + \sum I = 286.74 \text{ in}^4 \]

\[ O = \sum A \bar{y} \]

\[ = 31.83 \text{ in}^3 \]

\[ t = 0.375 \text{ in.} \]

\[ \tau_{\text{max}} = \frac{VQ_{\text{max}}}{lt} = \frac{(25)(31.83)}{(286.74)(0.375)} = \tau_{\text{max}} = 7.40 \text{ ksi} \]

PROBLEM 6.10

For the beam and loading shown, consider section \( n-n \) and determine \( a \) the largest shearing stress in that section, \( b \) the shearing stress at point \( a \).

SOLUTION

At section \( n-n \), \( V = 10 \text{ kN} \).

\[
I = I_1 + 4I_2 \\
= \frac{1}{12}bh_1^3 + 4\left(\frac{1}{12}b_2h_2^3 + A_2d_2^2\right) \\
= \frac{1}{12}(100)(150)^3 + 4\left(\frac{1}{12}(50)(12)^3 + (50)(12)(69)^2\right) \\

\( a \) \quad \tau_{\text{max}} = \frac{VQ}{It} = \frac{(10 \times 10^3)(364.05 \times 10^{-6})}{(39.58 \times 10^{-6})(0.100)} = 920 \times 10^3 \text{ Pa} \\
\tau_{\text{max}} = 920 \text{ kPa} \uparrow

\( b \) \quad \tau_a = \frac{VQ}{It} = \frac{(10 \times 10^3)(302.8 \times 10^{-6})}{(39.58 \times 10^{-6})(0.100)} = 765 \times 10^3 \text{ Pa} \\
\tau_a = 765 \text{ kPa} \uparrow
PROBLEM 6.11

For the beam and loading shown, consider section n-n and determine (a) the largest shearing stress in that section, (b) the shearing stress at point a.

SOLUTION

At section n-n, \( V = 80 \text{kN} \)

Consider cross section as composed of rectangles of types 1, 2, and 3.

\[
I_1 = \frac{1}{12} (12)(80)^3 + (12)(80)(90)^2 = 8.288 \times 10^6 \text{mm}^4 \\
I_2 = \frac{1}{12} (180)(16)^3 + (180)(16)(42)^2 = 5.14176 \times 10^6 \text{mm}^4 \\
I_3 = \frac{1}{12} (16)(68)^3 = 419.24 \times 10^3 \text{mm}^4 \\
I = 4I_1 + 2I_2 + 2I_3 = 44.274 \times 10^6 \text{mm}^4 \\
= 44.274 \times 10^{-6} \text{m}^4
\]

(a) Calculate \( Q \) at neutral axis.

\[
Q_1 = (12)(80)(90) = 86.4 \times 10^3 \text{mm}^4 \\
Q_2 = (180)(16)(42) = 120.96 \times 10^3 \text{mm}^4 \\
Q_3 = (16)(34)(17) = 9.248 \times 10^3 \text{mm}^4 \\
Q = 2Q_1 + Q_2 + 2Q_3 = 312.256 \times 10^3 \text{mm}^3 = 312.256 \times 10^{-6} \text{m}^3 \\
\tau = \frac{VQ}{It} = \frac{(80 \times 10^3)(312.256 \times 10^{-6})}{(44.274 \times 10^{-6})(2 \times 16 \times 10^{-3})} = 17.63 \times 10^6 \text{Pa} \quad \tau = 17.63 \text{MPa}
\]

(b) At point a, \( Q = Q_1 = 86.4 \times 10^3 \text{mm}^4 = 86.4 \times 10^{-6} \text{m}^4 \)

\[
\tau = \frac{VQ}{It} = \frac{(80 \times 10^3)(86.4 \times 10^{-6})}{(44.274 \times 10^{-6})(12 \times 10^{-3})} = 13.01 \times 10^6 \text{Pa} \quad \tau = 13.01 \text{MPa}

\[ \sum F_Y = 0: \quad R_A + R_B - 10 - 10 = 0 \]
\[ R_A = R_B = 10 \text{ kips} \]

From the shear diagram, \( V = 10 \text{ kips at } n-n. \)

\[ I = \frac{1}{12} b_2 h_2^3 - \frac{1}{12} b_1 h_1^3 \]
\[ = \frac{1}{12} (4)(4)^3 - \frac{1}{12} (3)(3)^3 = 14.583 \text{ in}^4 \]

(a) \[ Q = A_1 \bar{Y}_1 + A_2 \bar{Y}_2 = (3) \left( \frac{1}{2} \right) (1.75) + (2) \left( \frac{1}{2} \right) (2)(1) = 4.625 \text{ in}^3 \]

PROBLEM 6.13

For a beam having the cross section shown, determine the largest allowable vertical shear if the shearing stress is not to exceed 60 MPa.

SOLUTION

Calculate moment of inertia.

\[ I = \frac{1}{12} (50 \text{ mm})(120 \text{ mm})^3 - 2 \left[ \frac{1}{12} (30 \text{ mm})^4 + (30 \text{ mm} \times 30 \text{ mm})(35 \text{ mm})^2 \right] \]

\[ I = 7.2 \times 10^6 \text{ mm}^4 - 2[1.170 \times 10^6 \text{ mm}^4] = 4.86 \times 10^6 \text{ mm}^4 \]

\[ = 4.86 \times 10^{-6} \text{ m}^4 \]

Assume that \( \tau_m \) occurs at point \( a \).

\[ t = 2(10 \text{ mm}) = 0.02 \text{ m} \]

\[ Q = (10 \text{ mm} \times 50 \text{ mm})(55 \text{ mm}) + 2[(10 \text{ mm} \times 30 \text{ mm})(35 \text{ mm})] \]

Check \( \tau \) at neutral axis:

\( t = 50 \text{ mm} = 0.05 \text{ m} \)

\[

PROBLEM 6.14

For a beam having the cross section shown, determine the largest allowable vertical shear if the shearing stress is not to exceed 60 MPa.

SOLUTION

Calculate moment of inertia.

\[
I = 2 \left[ \frac{1}{12} (10 \text{ mm})(120 \text{ mm})^3 \right] + \frac{1}{12} (30 \text{ mm})(40 \text{ mm})^3

\[

\[
Q = (10 \text{ mm} \times 40 \text{ mm})(40 \text{ mm}) = 16 \times 10^3 \text{ mm}^3 \quad Q = 16 \times 10^{-6} \text{ m}^3
\]

For \( \tau_{all} = 60 \text{ MPa} \),

\[
\tau_m = \tau_{all} = \frac{VQ}{I_t}
\]

\[
60 \times 10^6 \text{ Pa} = \frac{V(16 \times 10^{-6} \text{ m}^3)}{(3.04 \times 10^{-6} \text{ m}^4)(0.01 \text{ m})} \quad V = 114.0 \text{ kN}

Check \( \tau \) at neutral axis:

\[

\[
Q = 2[(10 \times 60)(30)] + (30 \times 20)(10) = 42 \times 10^3 \text{ m}^3 = 42 \times 10^{-6} \text{ m}^3

**PROBLEM 6.15**

For the beam and loading shown, determine the minimum required depth \( h \), knowing that for the grade of timber used, \( \sigma_{\text{all}} = 1750 \) psi and \( \tau_{\text{all}} = 130 \) psi.

**SOLUTION**

Total load: 

\[
(750 \text{ lb/ft})(16 \text{ ft}) = 12 \times 10^3 \text{ lb}
\]

Reaction at \( A \):

\[
R_A = 6 \times 10^3 \text{ lb} \uparrow
\]

\( V_{\text{max}} = 6 \times 10^3 \text{ lb} \)

\( M_{\text{max}} = \frac{1}{2}(8 \text{ ft})(6 \times 10^3) = 24 \times 10^3 \text{ lb \cdot ft} \)

\[
= 288 \times 10^3 \text{ lb \cdot in}
\]

Bending: \( S = \frac{1}{6}bh^2 \) for rectangular section.

\[
S = \frac{M_{\text{max}}}{\sigma_{\text{all}}} = \frac{288 \times 10^3}{1750} = 164.57 \text{ in}^3
\]

\[
h = \sqrt{\frac{6S}{b}} = \sqrt{\frac{(6)(164.57)}{5}} = 14.05 \text{ in}
\]

Shear: \( I = \frac{1}{12}bh^3 \) for rectangular section.

\[
A = \frac{1}{2}bh
\]

\[
\bar{y} = \frac{1}{4}h
\]

\[
Q = A\bar{y} = (b)\left(\frac{1}{2}h\right)\left(\frac{1}{4}h\right) = \frac{1}{8}bh^2
\]

\[
\tau_{\text{max}} = \frac{VQ}{lb} = \frac{3V_{\text{max}}}{2bh}
\]

\[
h = \frac{3V_{\text{max}}}{2b\tau_{\text{max}}} = \frac{(3)(6 \times 10^3)}{(2)(5)(130)} = 13.85 \text{ in}
\]

The larger value of \( h \) is the minimum required depth. \( h = 14.05 \text{ in} \).
PROBLEM 6.16

For the beam and loading shown, determine the minimum required width $b$, knowing that for the grade of timber used, $\sigma_{\text{all}} = 12$ MPa and $\tau_{\text{all}} = 825$ kPa.

SOLUTION

$$+ \) $M_D = 0$: \quad -3R_A + (2)(2.4) + (1)(4.8) = 0$

$$R_A = 3.2 \text{kN}$$

Draw shear and bending moment diagrams.

$|V|_{\text{max}} = 4.0 \text{kN} \quad |M|_{\text{max}} = 4.0 \text{kN} \cdot \text{m}$

Bending: $S = \frac{|M|_{\text{max}}}{\sigma_{\text{all}}} = \frac{4.0 \times 10^3}{12 \times 10^6}$

$= 333.33 \times 10^{-6} \text{m}^3 = 333.33 \times 10^3 \text{mm}^3$

For a rectangular cross section,

$$S = \frac{I}{c} = \frac{1}{12} \frac{bh^3}{h^2} = \frac{1}{6} bh^2$$

$$b = 6S \frac{h^2}{bh^3} = \frac{(6)(333.33 \times 10^3)}{150^2} = 88.9 \text{mm}$$

$$A = \frac{1}{2} bh, \quad \bar{y} = \frac{1}{4} h$$

$$Q = A\bar{y} = \frac{1}{8} bh^2, \quad I = \frac{1}{12} bh^3$$

$$\tau = \frac{VQ}{It} = \frac{3V}{2bh}$$

$$bh = \frac{3V}{2 \tau} = \frac{3 \times 4.0 \times 10^3}{2 \times 825 \times 10^3}$$

$= 7.2727 \times 10^{-3} \text{m}^2 = 7.2727 \times 10^3 \text{mm}^2$

$$\frac{bh}{h} = \frac{7.2727 \times 10^3}{150} = 48.5 \text{mm}$$

The required value for $b$ is the larger one.  

$b = 88.9 \text{mm}$

PROBLEM 6.17

A timber beam $AB$ of length $L$ and rectangular cross section carries a uniformly distributed load $w$ and is supported as shown. (a) Show that the ratio $\tau_m/\sigma_m$ of the maximum values of the shearing and normal stresses in the beam is equal to $2h/L$, where $h$ and $L$ are, respectively, the depth and the length of the beam. (b) Determine the depth $h$ and the width $b$ of the beam, knowing that $L = 5$ m, $w = 8$ kN/m, $\tau_m = 1.08$ MPa, and $\sigma_m = 12$ MPa.

SOLUTION

From shear diagram,

$$|V|_m = \frac{wL}{4}$$  \hspace{1cm} (1)

For rectangular section,

$$A = bh$$  \hspace{1cm} (2)

$$\tau_m = \frac{3V_m}{2A} = \frac{3wL}{8bh}$$  \hspace{1cm} (3)

From bending moment diagram,

$$|M|_m = \frac{wL^2}{32}$$  \hspace{1cm} (4)

For a rectangular cross section,

$$S = \frac{1}{6}bh^2$$  \hspace{1cm} (5)

$$\sigma_m = \frac{|M|_m}{S} = \frac{3wL^2}{16bh^2}$$  \hspace{1cm} (6)

(a) Dividing Eq. (3) by Eq. (6),

$$\frac{\tau_m}{\sigma_m} = \frac{2h}{L}$$  \hspace{1cm}

(b) Solving for $h$:

$$h = \frac{L\tau_m}{2\sigma_m} = \frac{(5)(1.08 \times 10^6)}{(2)(12 \times 10^6)} = 225 \times 10^{-3} \text{ m} \quad h = 225 \text{ mm}$$

Solving Eq. (3) for $b$:

$$b = \frac{3wL}{8h\tau_m} = \frac{(3)(8 \times 10^3)(5)}{(8)(225 \times 10^{-3})(1.08 \times 10^6)}$$

$$= 61.7 \times 10^{-3} \text{ m} \quad b = 61.7 \text{ mm}$$
PROBLEM 6.18

A timber beam $AB$ of length $L$ and rectangular cross section carries a single concentrated load $P$ at its midpoint $C$. (a) Show that the ratio $\tau_m/\sigma_m$ of the maximum values of the shearing and normal stresses in the beam is equal to $2h/L$, where $h$ and $L$ are, respectively, the depth and the length of the beam. (b) Determine the depth $h$ and the width $b$ of the beam, knowing that $L = 2$ m, $P = 40$ kN, $\tau_m = 960$ kPa, and $\sigma_m = 12$ MPa.

SOLUTION

Reactions: $R_A = R_B = P/2 \uparrow$

1. $V_{\text{max}} = R_A = \frac{P}{2}$

2. $A = bh$ for rectangular section.

3. $\tau_m = \frac{3V_{\text{max}}}{2A} = \frac{3P}{4bh}$ for rectangular section.

4. $M_{\text{max}} = \frac{PL}{4}$

5. $S = \frac{1}{6}bh^2$ for rectangular section.

6. $\sigma_m = \frac{M_{\text{max}}}{S} = \frac{3PL}{2bh^2}$

(a) $\frac{\tau_m}{\sigma_m} = \frac{h}{2L}$

(b) Solving for $h$, $h = \frac{2L\tau_m}{\sigma_m} = \frac{(2)(2)(960 \times 10^3)}{12 \times 10^6} = 320 \times 10^{-3}$ m $h = 320$ mm

Solving Eq. (3) for $b$, $b = \frac{3P}{4h\tau_m} = \frac{(3)(40 \times 10^3)}{(4)(320 \times 10^{-3})(960 \times 10^3)} = 97.7 \times 10^{-3}$ m $b = 97.7$ mm
**PROBLEM 6.19**

For the wide-flange beam with the loading shown, determine the largest load $P$ that can be applied, knowing that the maximum normal stress is $24$ ksi and the largest shearing stress using the approximation $\tau_{max} = V/A_{web}$ is $14.5$ ksi.

**SOLUTION**

\[ + \sum M_C = 0: -15R_A + qP = 0 \]
\[ R_A = 0.6P \]

Draw shear and bending moment diagrams.

\[ |V|_{max} = 0.6P \]
\[ |M|_{max} = 0.6PL_{AB} \]
\[ L_{AB} = 6 \text{ ft} = 72 \text{ in.} \]

**Bending.** For $W 24 \times 104$, $S = 258 \text{ in}^3$

\[ S = \frac{|M|_{max}}{\sigma_{all}} = \frac{0.6PL_{AB}}{\sigma_{all}} \]
\[ P = \sigma_{all}S = \frac{(24)(258)}{(0.6)(72)} = 143.3 \text{ kips} \]

**Shear.**

\[ A_{web} = dt_w \]
\[ = (24.1)(0.500) \]
\[ = 12.05 \text{ in}^2 \]

\[ \tau = \frac{|V|_{max}}{A_{web}} = \frac{0.6P}{A_{web}} \]
\[ P = \frac{\tau A_{web}}{0.6} = \frac{(14.5)(12.05)}{0.6} = 291 \text{ kips} \]

The smaller value of $P$ is the allowable value. $P = 143.3$ kips \(\blacktriangleright\)
PROBLEM 6.20

For the wide-flange beam with the loading shown, determine the largest load \( P \) that can be applied, knowing that the maximum normal stress is 160 MPa and the largest shearing stress using the approximation \( \tau_m = V/A_{web} \) is 100 MPa.

SOLUTION

\[ + \sum M_E = 0: -3.6 R_A + 3.0 P + 2.4 P + 1.8 P = 0 \]
\[ R_A = 2P \uparrow \]

Draw shear and bending moment diagrams.

\[ M_B = 2PL_{AB}, \quad M_C = M_D = 3PL_{AB} \]
\[ |V|_{\text{max}} = 2P, \quad |M|_{\text{max}} = 3PL_{AB} \]

**Bending.** For W 360 × 122, \( S = 2020 \times 10^3 \text{ mm}^3 \)
\[ = 2020 \times 10^{-6} \text{ m}^3 \]
\[ \frac{|M|_{\text{max}}}{\sigma_{\text{all}}} = \frac{3PL_{AB}}{S} = \sigma_{\text{all}} \]
\[ P = \frac{\sigma_{\text{all}}S}{3L_{AB}} = \frac{(160 \times 10^6)(2020 \times 10^3)}{(3)(0.6)} = 179.6 \times 10^3 \text{ N} \]

**Shear.** \( A_{\text{web}} = d t_w = (363)(13.0) \)
\[ = 4.719 \times 10^3 \text{ mm}^2 = 4.719 \times 10^{-3} \text{ m}^2 \]
\[ \tau = \frac{|V|_{\text{max}}}{A_{\text{web}}} = \frac{2P}{A_{\text{web}}} \]
\[ P = \tau A_{\text{web}} = \frac{(100 \times 10^6)(4.719 \times 10^{-3})}{2} = 236 \times 10^3 \text{ N} \]

The smaller value of \( P \) is the allowable one. \( P = 179.6 \text{ kN} \)

A beam having the cross section shown is subjected to a vertical shear \( \mathbf{V} \). Determine \((a)\) the horizontal line along which the shearing stress is maximum, \((b)\) the constant \( k \) in the following expression for the maximum shearing stress

\[
\tau_{\text{max}} = k \frac{V}{A}
\]

where \( A \) is the cross-sectional area of the beam.

\[\text{SOLUTION}\]

\[
I = \frac{\pi}{4} c^4 \quad \text{and} \quad A = \pi c^2

For semicircle,

\[
A_s = \frac{\pi}{2} c^2 \quad \bar{y} = \frac{4c}{3\pi} \quad Q = A_s \bar{y} = \frac{\pi}{2} c^2 \cdot \frac{4c}{3\pi} = \frac{2}{3} c^3

\tau_{\text{max}} = \frac{VQ}{It} = \frac{V \cdot \frac{2}{3} c^3}{\frac{\pi}{4} c^4 \cdot 2c} = \frac{4V}{3\pi c^2} = \frac{4V}{3A} \quad k = \frac{4}{3} = 1.333\]
PROBLEM 6.26

A beam having the cross section shown is subjected to a vertical shear $V$. Determine (a) the horizontal line along which the shearing stress is maximum, (b) the constant $k$ in the following expression for the maximum shearing stress

$$\tau_{\text{max}} = k \frac{V}{A}$$

where $A$ is the cross-sectional area of the beam.

SOLUTION

$$A = \frac{1}{2} bh \quad I = \frac{1}{36} bh^3$$

For a cut at location $y$,

$$A(y) = \frac{1}{2} \left( \frac{by}{h} \right)^2 = \frac{by^2}{2h}$$

$$\bar{y}(y) = \frac{2}{3}h - \frac{2}{3}y$$

$$Q(y) = A\bar{y} = \frac{by^2}{3}(h - y)$$

$$t(y) = \frac{by}{h}$$

$$\tau(y) = \frac{VQ}{It} = \frac{V}{3} \frac{by^2}{bh^3} \left( \frac{by}{h} \right) = \frac{12Vy(h - y)}{bh^3} = \frac{12V}{bh^3} (hy - y^2)$$

(a) To find location of maximum of $\tau$, set $\frac{d\tau}{dy} = 0$.

$$\frac{d\tau}{dy} = \frac{12V}{bh^3} (h - 2y_m) = 0 \quad \Rightarrow \quad y_m = \frac{1}{2}h, \text{ i.e., at mid-height}$$

$$\tau_{\text{max}} = k \frac{V}{A}$$

where $A$ is the cross-sectional area of the beam.

SOLUTION

For a thin-walled circular section,

$$A = 2\pi r_m t_m$$

$$J = Ar_m^2 = 2\pi r_m^3 t_m$$

$$I = \frac{1}{2} J = \pi r_m^3 t_m$$

For a semicircular arc,

$$\bar{y} = \frac{2r_m}{\pi}$$

$$A_s = \pi r_m t_m$$

$$Q = A_s \bar{y} = \pi r_m t_m \frac{2r_m}{\pi} = 2r_m^3 t_m$$

(a) $t = 2t_m$ at neutral axis where maximum occurs.

(b) $\tau_{\text{max}} = \frac{VQ}{It} = \frac{V(2r_m^3 t_m)}{(\pi r_m t_m)(2t_m)} = \frac{V}{\pi r_m t_m} = \frac{2V}{A}$

$$Q(y) = A \bar{y} = \frac{by^2}{2} - \frac{by^3}{3h}$$

$$\tau(y) = \frac{VQ}{It} = \frac{V}{bh^2} \cdot \frac{h}{by} \cdot \frac{by^2}{2} - \frac{by^3}{3h} = \frac{V}{bh} \left[ 3 \left( \frac{y}{h} \right) - 2 \left( \frac{y}{h} \right)^2 \right]$$

(a) To find location of maximum of $\tau$, set $\frac{d\tau}{dy} = 0$.

$$\frac{d\tau}{dy} = \frac{V}{bh^2} \left[ 3 - 4 \frac{y_m}{h} \right] = 0 \quad \frac{y_m}{h} = \frac{3}{4}, \text{ i.e., } \pm \frac{1}{4} h \text{ from neutral axis. }$$

(b) $\tau(y_m) = \frac{V}{bh} \left[ 3 \left( \frac{3}{4} \right) - 2 \left( \frac{3}{4} \right)^2 \right] = \frac{9}{8} \frac{V}{bh} = 1.125 \frac{V}{A} \quad k = 1.125$

PROBLEM 6.34

Knowing that a vertical shear $V$ of 50 kips is exerted on W14×82 rolled-steel beam, determine the shearing stress $(a)$ at point $a$, $(b)$ at the centroid $C$.

SOLUTION

For W14×82, $d = 14.3$ in., $b_f = 10.1$ in., $t_f = 0.855$ in., $t_w = 0.510$ in., $I = 881$ in$^4$

(a) $A_a = (4.15)(0.855) = 3.5482$ in$^2$

\[ \bar{y}_a = \frac{d}{2} - \frac{t_f}{2} = \frac{14.3}{2} - \frac{0.855}{2} = 6.7225 \text{ in.} \]

\[ Q_a = A_a \bar{y}_a = 23.853 \text{ in}^3 \]

\[ t_a = t_f = 0.855 \text{ in.} \]

\[ \tau_a = \frac{VQ_a}{I_{t_a}} = \frac{(50)(23.853)}{(881)(0.855)} \quad \tau_a = 1.583 \text{ ksi} \]

(b) $A_1 = b_f t_f (10.1)(0.855) = 8.6355$ in$^2$

\[ \bar{y}_1 = \frac{d}{2} - \frac{t_f}{2} = 6.7225 \text{ in.} \]

\[ A_2 = t_w \left( \frac{d}{2} - t_f \right) = (0.510)(6.295) = 3.2105 \text{ in}^2 \]

\[ \bar{y}_2 = \frac{1}{2} \left( \frac{d}{2} - t_f \right) = \frac{1}{2} (6.295) = 3.1475 \text{ in.} \]

\[ Q_C = A_1 \bar{y}_1 + A_2 \bar{y}_2 = (8.6355)(6.7225) + (3.2105)(3.1475) = 68.157 \text{ in}^3 \]

\[ t_C = t_w = 0.510 \text{ in.} \]

PROBLEM 6.36

Knowing that a given vertical shear $V$ causes a maximum shearing stress of 75 MPa in the hat-shaped extrusion shown, determine the corresponding shearing stress $(a)$ at point $a$, $(b)$ at point $b$.

SOLUTION

Neutral axis lies 30 mm above bottom.

$$
\tau_c = \frac{VQ_c}{It} \quad \tau_a = \frac{VQ_a}{It_a} \quad \tau_b = \frac{VQ_b}{It_b}
$$

$$
\tau_a = \frac{Q_d f_c}{Q_c t_a} \quad \tau_b = \frac{Q_d f_c}{Q_c t_b}
$$

$Q_c = (6)(30)(15) + (14)(4)(28) = 4260 \text{ mm}^3$

$t_c = 6 \text{ mm}$

$Q_a = (14)(4)(28) = 1568 \text{ mm}^3$

$t_a = 4 \text{ mm}$

$Q_b = (14)(4)(28) = 1568 \text{ mm}^3$

$t_b = 4 \text{ mm}$

$$
\tau_c = 75 \text{ MPa}

$$(a) \quad \tau_a = \frac{Q_a f_c}{Q_c t_a} \cdot \frac{t_c}{\tau_c} = 1568 \cdot \frac{6}{4260} \cdot \frac{4}{75} \quad \tau_a = 41.4 \text{ MPa} \uparrow$$

$$(b) \quad \tau_b = \frac{Q_b f_c}{Q_c t_b} \cdot \frac{t_c}{\tau_c} = 1568 \cdot \frac{6}{4260} \cdot \frac{4}{75} \quad \tau_b = 41.4 \text{ MPa} \uparrow$$
PROBLEM 6.37

Knowing that a given vertical shear $V$ causes a maximum shearing stress of 75 MPa in an extruded beam having the cross section shown, determine the shearing stress at the three points indicated.

SOLUTION

$$\tau = \frac{VQ}{It} \quad \tau \text{ is proportional to } Q/t.$$  

Point $c$:

$$Q_c = (30)(10)(75) = 22.5 \times 10^3 \text{ mm}^3$$

$$t_c = 10 \text{ mm}$$

$$Q_c/t_c = 2250 \text{ mm}^2$$

Point $b$:

$$Q_b = Q_c + (20)(50)(55) = 77.5 \times 10^3 \text{ mm}^3$$

$$t_b = 20 \text{ mm}$$

$$Q_b/t_b = 3875 \text{ mm}^2$$

Point $a$:

$$Q_a = 2Q_b + (120)(30)(15) = 209 \times 10^3 \text{ mm}^3$$

$$t_a = 120 \text{ mm}$$

$$Q_a/t_a = 1741.67 \text{ mm}^2$$

$(Q/t)_m$ occurs at $b$.

$$\tau_m = \tau_b = 75 \text{ MPa}$$

$$\frac{\tau_a}{Q_a/t_a} = \frac{\tau_b}{Q_b/t_b} = \frac{\tau_c}{Q_c/t_c}$$

A plate of 4-mm thickness is bent as shown and then used as a beam. For a vertical shear of 12 kN, determine (a) the shearing stress at point A, (b) the maximum shearing stress in the beam. Also, sketch the shear flow in the cross section.

SOLUTION

\[ \tan \alpha = \frac{20}{48} \quad \alpha = 22.62^\circ \]

Slanted side: \[ A_s = (4 \sec \alpha)(48) = 208 \text{ mm}^2 \]
\[ I_s = \frac{1}{12} (4 \sec \alpha)(48)^3 = 39.936 \times 10^3 \text{ mm}^4 \]

Top: \[ I_T = \frac{1}{12} (50)(4)^3 + (50)(4)(24)^2 = 115.46 \times 10^3 \text{ mm}^4 \]

Bottom: \[ I_B = I_T = 115.46 \times 10^3 \text{ mm}^4 \]
\[ I = 2I_s + I_T + I_B = 310.8 \times 10^3 \text{ mm}^4 = 310.8 \times 10^{-9} \text{ m}^4 \]

(a) \[ Q_A = (25)(4)(24) = 2.4 \times 10^3 \text{ mm}^3 = 2.4 \times 10^{-6} \text{ m}^3 \]
\[ t = 4 \text{ mm} = 4 \times 10^{-3} \text{ m} \]
\[ \tau_A = \frac{VQ_A}{It} = \frac{(12 \times 10^3)(2.4 \times 10^{-6})}{(310.8 \times 10^{-9})(4 \times 10^{-3})} = 23.2 \times 10^6 \text{ Pa} \]
\[ \tau_A = 23.2 \text{ MPa} \]

(b) Maximum shearing occurs at point M, 24 mm above the bottom
\[ Q_M = Q_A + (4 \sec \alpha)(24)(12) = 2.4 \times 10^3 + 1.248 \times 10^3 = 3.648 \times 10^3 \text{ mm}^3 \]
\[ = 3.648 \times 10^{-6} \text{ m}^3 \]

\[ Q_a = (2)(24)(12) = 576 \text{ mm}^3 = 576 \times 10^{-9} \text{ mm}^3 \]

\[ Q_a = 0 \]

\[ Q_c = Q_b - (12)(2)(25) = -600 \text{ mm}^3 = -600 \times 10^{-9} \text{ m}^3 \]

\[ Q_d = Q_c - (2)(24)(12) = -1.176 \times 10^3 \text{ mm}^3 = -1.176 \times 10^{-6} \text{ m}^3 \]

\[ Q_e = Q_d + (2)(26)(13) = -600 \text{ mm}^3 = -500 \times 10^{-9} \text{ m}^3 \]

\[ \tau_d = 22.0 \text{ MPa} \]

\[ \tau_e = \frac{VQ_e}{It} = \frac{(5 \times 10^3)(500 \times 10^{-9})}{(133.75 \times 10^{-9})(2 \times 10^{-3})} = 9.35 \times 10^6 \text{ Pa} \]

Also, sketch the shear flow in the cross section.

SOLUTION

\[
L_{BD} = L_{EF} = \sqrt{4.8^2 + 2^2} = 5.2\text{ in.}
\]

Neutral axis lies at 2.4 in. above \( AB \).

Calculate \( I \).

\[
I_{AB} = (3t)(2.4)^2 = 17.28t
\]
\[

\]
\[
I_{DE} = (6t)(2.4)^2 = 34.56t
\]
\[
I_{EF} = I_{DB} = 9.984t
\]
\[
I_{FG} = I_{AB} = 17.28t
\]
\[
I = \Sigma I = 89.09t
\]

\((a)\) At point \( C \), \( Q_C = Q_{AB} + Q_{BC} = (3t)(2.4) + (2.6t)(1.2) = 10.32t \)

\[
\tau = \frac{VQ_C}{It} \quad \therefore \quad t = \frac{VQ}{\tau I} = \frac{(600)(10.32t)}{(300)(89.09t)} = 0.23168 \text{ in.}

**PROBLEM 6.55**

For a beam made of two or more materials with different moduli of elasticity, show that Eq. (6.6)

\[ \tau_{ave} = \frac{VQ}{It} \]

remains valid provided that both \( Q \) and \( I \) are computed by using the transformed section of the beam (see Sec. 4.6), and provided further that \( t \) is the actual width of the beam where \( \tau_{ave} \) is computed.

**SOLUTION**

Let \( E_{ref} \) be a reference modulus of elasticity.

\[ n_1 = \frac{E_1}{E_{ref}}, \quad n_2 = \frac{E_2}{E_{ref}}, \quad \text{etc.} \]

Widths \( b \) of actual section are multiplied by \( n \)'s to obtain the transformed section. The bending stress distribution in the cross section is given by

\[ \sigma_x = -\frac{n My}{I} \]

where \( I \) is the moment of inertia of the transformed cross section and \( y \) is measured from the centroid of the transformed section.

The horizontal shearing force over length \( \Delta x \) is

\[ \Delta H = \int (\Delta \sigma_x) \, dA = \int \frac{n(\Delta M)}{I} \, dA = \frac{(\Delta M)}{I} \int ny \, dA = \frac{Q(\Delta M)}{I} \]

\[ Q = \int ny \, dA = \text{first moment of transformed section.} \]

Shear flow:

\[ q = \frac{\Delta H}{\Delta x} = \frac{\Delta M}{\Delta x} \frac{Q}{I} = \frac{VQ}{I} \]

\( q \) is distributed over actual width \( t \), thus

\[ \tau = \frac{q}{t} \]

\[ \tau = \frac{VQ}{It} \]

(Hint: Use the method indicated in Prob. 6.55.)

PROBLEM 6.58

A composite beam is made by attaching the timber and steel portions shown with bolts of 12-mm diameter spaced longitudinally every 200 mm. The modulus of elasticity is 10 GPa for the wood and 200 GPa for the steel. For a vertical shear of 4 kN, determine (a) the average shearing stress in the bolts, (b) the shearing stress at the center of the cross section. (Hint: Use the method indicated in Prob. 6.55.)

SOLUTION

Let

\[ E_{\text{ref}} = E_s = 200 \text{ GPa} \]
\[ n_s = 1 \quad n_w = \frac{E_w}{E_s} = \frac{10 \text{ GPa}}{200 \text{ GPa}} = \frac{1}{20} \]

Widths of transformed section:

\[ b_s = 150 \text{ mm} \quad b_w = \left( \frac{1}{20} \right) (150) = 7.5 \text{ mm} \]
\[ I = 2 \left[ \frac{1}{12} (150)(12)^3 + (150)(12)(125 + 6)^2 \right] + \frac{1}{12} (7.5)(250)^3 \]
\[ = 2[0.0216 \times 10^6 + 30.890 \times 10^6] + 9.766 \times 10^6 \]
\[ = 71.589 \times 10^6 \text{ mm}^4 = 71.589 \times 10^{-6} \text{ m}^4 \]

(a) \[ Q_1 = (150)(12)(125 + 6) = 235.8 \times 10^3 \text{ mm}^3 = 235.8 \times 10^{-6} \text{ m}^3 \]
\[ q = \frac{VQ_1}{I} = \frac{(4 \times 10^3)(235.8 \times 10^{-6})}{71.589 \times 10^{-6}} = 13.175 \times 10^3 \text{ N/m} \]
\[ F_{\text{bolt}} = qs = (23.187 \times 10^3)(200 \times 10^{-3}) = 2.635 \times 10^3 \text{ N} \]
\[ A_{\text{bolt}} = \frac{\pi}{4}d_{\text{bolt}}^2 = \left( \frac{\pi}{4} \right)(12)^2 = 113.1 \text{ mm}^2 = 113.1 \times 10^{-6} \text{ m}^2 \]
\[ \tau_{\text{bolt}} = \frac{F_{\text{bolt}}}{A_{\text{bolt}}} = \frac{2.635 \times 10^3}{113.1 \times 10^{-6}} = 23.3 \times 10^6 \text{ Pa} \]
\[ \tau_{\text{bolt}} = 23.3 \text{ MPa} \]

(b) \[ Q_2 = Q_1 + (7.5)(125)(62.5) = 235.8 \times 10^3 + 58.594 \times 10^3 = 294.4 \times 10^3 \text{ mm}^3 = 294.4 \times 10^{-6} \text{ m}^3 \]
\[ t = 150 \text{ mm} = 150 \times 10^{-3} \text{ m} \]
\[ \tau_c = \frac{VQ_2}{lt} = \frac{(4 \times 10^3)(294.4 \times 10^{-6})}{(71.589 \times 10^{-6})(150 \times 10^{-3})} = 109.7 \times 10^3 \text{ Pa} \]
\[ \tau_c = 109.7 \text{ kPa} \]
PROBLEM 6.59

A composite beam is made by attaching the timber and steel portions shown with bolts of 12-mm diameter spaced longitudinally every 200 mm. The modulus of elasticity is 10 GPa for the wood and 200 GPa for the steel. For a vertical shear of 4 kN, determine (a) the average shearing stress in the bolts, (b) the shearing stress at the center of the cross section. (Hint: Use the method indicated in Prob. 6.55.)

SOLUTION

Let steel be the reference material.

\[ n_s = 1.0 \quad n_w = \frac{E_w}{E_s} = \frac{10 \text{ GPa}}{200 \text{ GPa}} = 0.05 \]

Depth of section:

\[ d = 90 + 84 + 90 = 264 \text{ mm} \]

For steel portion:

\[ I_s = 2 \frac{1}{12} bd^3 = (2) \left( \frac{1}{12} \right) (6)(264)^3 = 18.400 \times 10^6 \text{ mm}^4 \]

For the wooden portion:

\[ I_w = \frac{1}{12} b \left( d_1^3 - d_2^3 \right) = \frac{1}{12} (140)(264^3 - 84^3) = 207.75 \times 10^6 \text{ mm}^4 \]

For the transformed section:

\[ I = n_s I_s + n_w I_w \]

\[ I = (1.0)(18.400 \times 10^6) + (0.05)(207.75 \times 10^6) = 28.787 \times 10^6 \text{ mm}^4 = 28.787 \times 10^{-6} \text{ m}^4 \]

(a) Shearing stress in the bolts.

For the upper wooden portion 

\[ Q_w = (90)(140)(42 + 45) = 1.0962 \times 10^6 \text{ mm}^3 \]

For the transformed wooden portion

\[ Q = n_w Q_w = (0.05)(1.0962 \times 10^6) = 54.81 \times 10^3 \text{ mm}^3 = 54.81 \times 10^{-6} \text{ m}^3 \]

Shear flow on upper wooden portion.

\[ q = \frac{VQ}{I} = \frac{(4000)(54.81 \times 10^{-6})}{28.787 \times 10^{-6}} = 7616 \text{ N/m} \]

\[ F_{\text{bolt}} = qs = (7616)(0.200) = 1523.2 \text{ N} \]

\[ A_{\text{bolt}} = \frac{\pi d^2}{4} = \frac{\pi}{4}(12)^2 = 113.1 \text{ mm}^2 = 113.1 \times 10^{-6} \text{ m}^2 \]

Double shear:

\[ \tau_{\text{bolt}} = \frac{F_{\text{bolt}}}{2A_{\text{bolt}}} = \frac{1523.2}{(2)(113.1 \times 10^{-6})} \]

\[ = 6.73 \times 10^6 \text{ Pa} \]

\[ \tau_{\text{bolt}} = 6.73 \text{ MPa} \]
(b) Shearing stress at the center of the cross section.

For two steel plates \[ Q_t = (2)(6)(90 + 42)(90 - 42) = 76.032 \times 10^3 \text{ mm}^3 = 76.032 \times 10^{-6} \text{ m}^3 \]

For the neutral axis \[ Q = 54.81 \times 10^{-6} + 76.032 \times 10^{-6} = 130.842 \times 10^{-6} \text{ m}^3 \]

Shear flow across the neutral axis
\[ q = \frac{VQ}{I} = \frac{4000 \times (130.842 \times 10^{-6})}{28.787 \times 10^{-6}} = 18.181 \times 10^3 \text{ N/m} \]

Double thickness \[ 2t = 12 \text{ mm} = 0.012 \text{ m} \]

Shearing stress \[ \tau = \frac{q}{2t} = \frac{18.181 \times 10^3}{0.012} = 1.515 \times 10^6 \text{ Pa} \]

\[ \tau = 1.515 \text{ MPa} \]
PROBLEM 6.60

Consider the cantilever beam \( AB \) discussed in Sec. 6.8 and the portion \( ACKJ \) of the beam that is located to the left of the transverse section \( CC' \) and above the horizontal plane \( JK \), where \( K \) is a point at a distance \( y < y_Y \) above the neutral axis. (See Figure). (a) Recalling that \( \sigma_x = \sigma_y \) between \( C \) and \( E \) and \( \sigma_x = (\sigma_y / y_y) \) between \( E \) and \( K \), show that the magnitude of the horizontal shearing force \( H \) exerted on the lower face of the portion of beam \( ACKJ \) is

\[
H = \frac{1}{2} b \sigma_Y \left( 2c - y_Y - \frac{y^2}{y_Y} \right)
\]

(b) Observing that the shearing stress at \( K \) is

\[
\tau_{xy} = \lim_{\Delta x \to 0} \frac{\Delta H}{\Delta A} = \lim_{\Delta x \to 0} \left( \frac{1}{\Delta x} \frac{\Delta H}{b} \right) = \frac{1}{b} \frac{\partial H}{\partial x}
\]

and recalling that \( y_Y \) is a function of \( x \) defined by Eq. (6.14), derive Eq. (6.15).

SOLUTION

Point \( K \) is located a distance \( y \) above the neutral axis.

The stress distribution is given by

\[
\sigma = \sigma_Y \frac{y}{y_Y} \quad \text{for} \quad 0 \leq y < y_Y \quad \text{and} \quad \sigma = \sigma_Y \quad \text{for} \quad y_Y \leq y \leq c.
\]
PROBLEM 6.60 (Continued)

For equilibrium of horizontal forces acting on ACKJ,

\[ H = \int \sigma \, dA = \int_y^{y_f} \sigma_y \, \frac{y_b \, dy}{y} + \int_{y_f}^c \sigma_y \, b \, dy \]

\[ = \frac{\sigma_y b}{y} \left( \frac{y_f^2 - y^2}{2} \right) + \sigma_y b (c - y_f) \]

\[ H = \frac{1}{2} b \sigma_y \left( 2c - y_f - \frac{y^2}{y} \right) \]  \hfill (a)

Note that \( y_f \) is a function of \( x \).

\[ \tau_{xy} = \frac{1}{b} \frac{\partial H}{\partial x} = \frac{1}{2} \sigma_y \left( -\frac{\partial y_f}{\partial x} + \frac{y^2}{y} \frac{dy_f}{dx} \right) \]

\[ = -\frac{1}{2} \sigma_y \left( 1 - \frac{y^2}{y^2} \right) \frac{dy_f}{dx} \]

But

\[ M = P_x = \frac{3}{2} M_y \left( 1 - \frac{y^2}{y^2} \right) \]

Differentiating,

\[ \frac{dM}{dx} = P = \frac{3}{2} M_y \left( -\frac{2}{y} \frac{dy_f}{dx} \right) \]

\[ \frac{dy_f}{dx} = -\frac{P c^2}{y} \frac{M_y}{y} = -\frac{P c^2}{y^2} \frac{2 \sigma_y b c^2}{\sigma_y b} = -\frac{3}{2} \frac{P}{\sigma_y b y_f} \]

Then

\[ \tau_{xy} = \frac{1}{2} \sigma_y \left( 1 - \frac{y^2}{y^2} \right) \left( \frac{3}{2} \frac{P}{\sigma_y b y_f} \right) = \frac{3P}{4b y_f} \left( 1 - \frac{y^2}{y^2} \right) \]  \hfill (b)

PROBLEM 6.69

Determine the location of the shear center $O$ of a thin-walled beam of uniform thickness having the cross section shown.

SOLUTION

$L_{AB} = \sqrt{4^2 + 3^2} = 5 \text{ in.}$ \hspace{1cm} $A_{AB} = 5t$

$I_{AB} = \frac{1}{12} A_{AB} h^2 + A_{AB} d^2 = \frac{1}{12} (5t)(3)^2 + (5t)(4)^2 = 83.75 \ t \text{ in}^4$

$I_{BD} = \frac{1}{12} (t)(5)^3 = 10.417 \ t \text{ in}^4$

$I = 2I_{AB} + I_{BD} = 177.917 \ t \text{ in}^4$

In part $BD$, \hspace{1cm} $Q = Q_{AB} + Q_{BY}$

$Q = (5t)(4) + (2.5 - y)t \left( \frac{1}{2} \right)(2.5 + y)$

$= 20t + 3.125t - \frac{1}{2}ty^2 = \left( 23.125 - \frac{1}{2}y^2 \right)t$

$	au = \frac{VQ}{It}$ \hspace{1cm} $F_{BD} = \int \tau dA = \int_{-2.5}^{2.5} \frac{V(23.125 - \frac{1}{2}y^2)t}{It} \cdot tdy$

$= \frac{Vt}{I} \int_{-2.5}^{2.5} \left( 23.125 - \frac{1}{2}y^2 \right) dy = \frac{Vt}{I} \left[ 23.125y - \frac{1}{6}y^3 \right]_{-2.5}^{2.5}$

$= \frac{Vt}{I} \cdot 2 \left( 23.125(2.5) - \frac{(2.5)^3}{6} \right) = \frac{Vt(110.417)}{177.917t} = 0.62061V$

$\Sigma M_K = + \Sigma M_K: \quad -V \left( \frac{10}{3} - e \right) = -\frac{10}{3}(0.62061V)$

$e = \frac{10}{3}[1 - 0.62061] \quad \Rightarrow \quad e = 1.265 \text{ in.}$

Note that the lines of action of $F_{AB}$ and $F_{DE}$ pass through point $K$. Thus, these forces have zero moment about point $K$.

**PROBLEM 6.73**

Determine the location of the shear center \( O \) of a thin-walled beam of uniform thickness having the cross section shown.

**SOLUTION**

For a thin-walled hollow circular cross section, \( A = 2\pi at \)

\[
J = a^2 A = 2\pi a^3 t \quad I = \frac{1}{2} J = \pi a^3 t
\]

For the half-pipe section, \( I = \frac{\pi}{2} a^3 t \)

Use polar coordinate \( \theta \) for partial cross section.

\[
A = st = a \theta t \\
\bar{r} = a \frac{\sin \alpha}{\alpha} \quad \text{where} \quad \alpha = \frac{\theta}{2} \\
\bar{y} = \bar{r} \cos \alpha = a \frac{\sin \alpha \cos \alpha}{\alpha} \\
Q = A\bar{y} = a^2 t a \frac{\sin \alpha \cos \alpha}{\alpha} = a^2 t (2 \sin \alpha \cos \alpha) \\
= a^2 t \sin 2\alpha = a^2 t \sin \theta \\
\tau = \frac{VQ}{It} = \frac{Va^2}{I} \sin \theta \\
M_H = \int a \tau \, dA = \left[ a V a^2 \frac{\sin \theta \tan \theta}{I} \right]_0^\pi = V a^4 t \frac{1}{I} - \cos \theta \left|_0^\pi \right. \\
= 2 \frac{V a^4 t}{I} = \frac{4}{\pi} Va
\]

But \( M_H = V e \), hence

\[
e = \frac{4}{\pi} a = 1.273a
\]
PROBLEM 6.74

Determine the location of the shear center \( O \) of a thin-walled beam of uniform thickness having the cross section shown.

SOLUTION

For whole cross section, \( A = 2\pi at \)

\[
J = Aa^2 = 2\pi a^3 t \quad I = \frac{1}{2} J = \pi a^3 t
\]

Use polar coordinate \( \theta \) for partial cross section.

\[
A = st = a\theta t \quad s = \text{arc length}
\]

\[
\bar{r} = a\frac{\sin \alpha}{\alpha} \quad \text{where} \quad \alpha = \frac{1}{2} \theta
\]

\[
\bar{y} = \bar{r} \sin \alpha = a\frac{\sin^2 \alpha}{\alpha}
\]

\[
Q = A\bar{y} = a\theta t \frac{\sin^2 \alpha}{\alpha} = a^2 t \left(1 - \cos \alpha\right)
\]

\[
\tau = \frac{VQ}{It} = a^2 t \left(1 - \cos \theta\right)
\]

\[
M_c = \int a\tau dA = \int_a^{2\pi} \frac{Va^3 t}{I} \left(1 - \cos \theta\right) t d\theta = \frac{Va^3 t}{I} \left[\theta - \sin \theta\right]_0^{2\pi}
\]

\[
= 2\pi V a^4 t = 2aV
\]

But \( M_c = V e \), hence \( e = 2a \)
PROBLEM 6.75

A thin-walled beam has the cross section shown. Determine the location of the shear center $O$ of the cross section.

\[ I = \frac{1}{12} t_1 h_1^3 + \frac{1}{12} t_2 h_2^3 \]

Right flange:

\[ A = \left( \frac{1}{2} h_2 - y \right) t_2 \]

\[ \bar{y} = \frac{1}{2} \left( \frac{1}{2} h_2 + y \right) t_2 \]

\[ Q = A \bar{y} \]

\[ = \frac{1}{2} \left( \frac{1}{2} h_2 - y \right) \left( \frac{1}{2} h_2 + y \right) t_2 \]

\[ = \frac{1}{2} \left( \frac{1}{4} h_2^2 - y^2 \right) t_2 \]

\[ \tau = \frac{VQ}{H_t} = \frac{V}{2H_t} \left( \frac{1}{4} h_2^2 - y^2 \right) t_2 \]

\[ F = \int \tau dA = \int_{-h/2}^{+h/2} \frac{Vt_2}{2I} \left( \frac{1}{4} h_2^2 - y^2 \right) dy = \frac{Vt_2}{2I} \left( \frac{1}{4} h_2^2 y - \frac{y^3}{3} \right) \bigg|_{-h/2}^{h/2} \]

\[ = \frac{Vt_2}{2I} \left( \frac{1}{4} h_2^2 \frac{h_2}{2} - \frac{1}{3} \left( \frac{h_2}{2} \right)^3 + \frac{1}{4} h_2^2 \frac{h_2}{2} - \frac{1}{3} \left( \frac{h_2}{2} \right)^3 \right) = \frac{Vt_2 h_2^3}{12I} = \frac{V t_2 h_2^3}{t_1 h_1^3 + t_2 h_2^3} \]

\[ e = -F_i b = -\frac{t_2 h_2^3 b}{t_1 h_1^3 + t_2 h_2^3} \]

\[ e = \frac{(0.75)(6)^3 (8)}{(0.75)(8)^3 + (0.75)(6)^3} \]

\[ e = 2.37 \text{ in.} \]

PROBLEM 6.76

A thin-walled beam has the cross section shown. Determine the location of the shear center \( O \) of the cross section.

SOLUTION

Let \( h_1 = AB, \ h_2 = DE, \) and \( h_3 = FG. \) \( I = \frac{1}{12} t (h_1^3 + h_2^3 + h_3^3) \)

Part \( AB: \)

\[
A = \left( \frac{1}{2} h_1 - y \right) t \quad \bar{y} = \frac{1}{2} \left( \frac{1}{2} h_1 + y \right) \\
Q = A\bar{y} = \frac{1}{2} t \left( \frac{1}{2} h_1 - y \right) \left( \frac{1}{2} h_1 + y \right) = \frac{1}{2} t \left( \frac{1}{4} h_1^2 - y^2 \right) \\
\tau = \frac{VQ}{It} = V \left( \frac{1}{2} \frac{1}{4} h_1^2 - y^2 \right)
\]

\[
F_1 = \int_0^{h_1} \tau dA = \int_0^{\frac{h_1}{2}} \frac{1}{2} \left( \frac{1}{4} h_1^2 - y^2 \right) dy = \frac{Vt}{2t} \left( \frac{1}{4} h_1^2 y - \frac{y^3}{3} \right) \Bigg|_0^{\frac{h_1}{2}} = \frac{Vt h_1^3}{12 I} = \frac{h_1^3 V}{h_1^3 + h_2^3 + h_3^3}
\]

Likewise, for part \( DE, \)

\[
F_2 = \frac{h_2^3 V}{h_1^3 + h_2^3 + h_3^3}
\]

and for part \( FG, \)

\[
F_3 = \frac{h_3^3 V}{h_1^3 + h_2^3 + h_3^3}
\]

\[
\Sigma M_H = \Sigma M_H: \ V e = a_2 F_2 + a_3 F_3 = \frac{a_2 h_2^3 + a_3 h_3^3}{h_1^3 + h_2^3 + h_3^3} V
\]

Dividing by \( V, \)

\[
e = \frac{a_2 h_2^3 + a_3 h_3^3}{h_1^3 + h_2^3 + h_3^3} = \frac{(3)(5)^3 + (5)(4)^3}{5^3 + 5^3 + 4^3} = 2.21 \text{ in.} \lla

PROBLEM 6.77

A thin-walled beam of uniform thickness has the cross section shown. Determine the dimension \( b \) for which the shear center \( O \) of the cross section is located at the point indicated.

SOLUTION

Part \( AB \):

\[
A(s) = ts \quad \bar{y}(s) = y_A - \frac{1}{2}s
\]

\[
Q(s) = A(s)\bar{y}(s) = ty_A s - \frac{1}{2}ts^2
\]

\[
g(s) = \frac{VQ(s)}{I} = \frac{Vt}{I} \left( y_A s - \frac{1}{2} s^2 \right)
\]

\[
F_{AB} = \int_0^{t_A} g(s) \, ds
\]

\[
= \frac{Vt}{I} \left( y_A^2t_A - \frac{1}{2}t_A^3 \right)
\]

At \( B \):

\[
Q_B = ty_A^2t_A - \frac{1}{2}t_A^3
\]

By symmetry, \( F_{FG} = F_{AB} \)

Part \( BD \):

\[
A(x) = tx
\]

\[
Q(x) = Q_B + y_B A(x) = Q_B + ty_B x
\]

\[
g(x) = \frac{VQ(x)}{I} = \frac{V}{I} (Q_B + ty_B x)
\]

\[
F_{BD} = \int_0^b g(x) \, dx = \frac{V}{I} \left( Q_B b + \frac{1}{2}ty_B b^2 \right)
\]

By symmetry, \( F_{EF} = F_{BD} \)

\( F_{DE} \) is not required, since its moment about \( O \) is zero.
PROBLEM 6.77 (Continued)

\[ \sum M_O = 0: \quad b(F_{AB} + F_{FG}) - y_B F_{BD} + y_F F_{EF} = 0 \]

\[ 2b F_{AB} - 2y_B F_{BD} = 0 \]

\[ 2b \cdot \frac{V_I}{I} \left( \frac{y_A I_{AB}^2 - \frac{I_{AB}^3}{6}}{2} \right) - 2y_B \frac{V}{I} \left( Q_b b + \frac{1}{2} t y_b b^2 \right) \]

\[ 2V_I \left( \frac{1}{2} y_A I_{AB}^2 - \frac{1}{6} I_{AB}^3 \right) b - 2V_I \left( y_A I_{AB}^2 - \frac{1}{2} I_{AB}^2 \right) y_b b - \frac{1}{2} y_b^2 b^2 = 0 \]

Dividing by \( \frac{2V_I}{I} \) and substituting numerical data,

\[ \left\{ \frac{1}{2} (90)(60)^2 - \frac{1}{6}(60)^3 \right\} b - \left\{ (90)(60) - \frac{1}{2}(60)^2 \right\} (30)b + \frac{1}{2}(30)^2 b^2 = 0 \]

\[ 126 \times 10^3 b - 108 \times 10^3 b + 450 b^2 = 0 \]

\[ 18 \times 10^3 b - 450 b^2 = 0 \]

\[ b = 0 \quad \text{and} \quad b = 40.0 \text{ mm} \]
PROBLEM 6.78

A thin-walled beam of uniform thickness has the cross section shown. Determine the dimension \( b \) for which the shear center \( O \) of the cross section is located at the point indicated.

SOLUTION

Part \( AB \):

\[
A = tx \quad \bar{y} = 60 \text{ mm} \\
Q = A\bar{y} = 60tx \text{ mm}^3 \\
\tau = \frac{VQ}{It} = \frac{60Vx}{I} \\
F_1 = \int \tau \, dA = \int_0^{30} \frac{60Vx}{I} \, dx = \frac{60Vt}{I} \int_0^{30} x \, dx \\
= \frac{60Vt}{I} \frac{x^2}{2} \bigg|_0^{30} = \frac{(60)(30)^2}{2} \frac{Vt}{I} = 27 \times 10^3 \frac{Vt}{I}
\]

Part \( DE \):

\[
A = tx \quad \bar{y} = 45 \text{ mm} \\
Q = A\bar{y} = 45tx \\
\tau = \frac{VQ}{It} = \frac{45Vx}{I} \\
F_2 = \int \tau \, dA = \int_0^{b} \frac{45Vx}{I} \, dx = \frac{45Vt}{I} \int_0^{b} x \, dx = \frac{45b^2Vt}{2I} \\
\sum M_O = \sum M_O : \quad 0 = (2)(45)F_2 - (2)(60)F_1 \\
\left[ (45)^2b^2 - (2)(60)(27 \times 10^3) \right] \frac{Vt}{I} = 0 \\
b^2 = \frac{(2)(60)(27 \times 10^3)}{45^2} = 1600 \text{ mm}^2 \\
b = 40 \text{ mm}
\]

Note that the pair of \( F_1 \) forces form a couple. Likewise, the pair of \( F_2 \) forces form a couple. The lines of action of the forces in \( BDOGK \) pass through point \( O \).
PROBLEM 6.79

For the angle shape and loading of Sample Prob. 6.6, check that \( \int qdz = 0 \) along the horizontal leg of the angle and \( \int qdy = P \) along its vertical leg.

SOLUTION

Refer to Sample Prob. 6.6.

Along horizontal leg:

\[
\tau_f = \frac{3P(a-z)(a-3z)}{4a^3} = \frac{3P}{4a^3}(a^2 - 4az + 3z^2)
\]

\[
\int qdz = \int_0^a \tau_f t dz = \frac{3P}{4a^3} \int_0^a (a^2 - 4az + 3z^2)dz
\]

\[
= \frac{3P}{4a^3} \left( a^2z - 4a \frac{z^2}{2} + 3 \frac{z^3}{3} \right) \bigg|_0^a
\]

\[
= \frac{3P}{4a^3} (a^3 - 2a^3 + a^3) = 0
\]

Along vertical leg:

\[
\tau_e = \frac{3P(a-y)(a+5y)}{4a^3} = \frac{3P}{4a^3}(a^2 + 4ay - 5y^2)
\]

\[
\int qdy = \int_0^a \tau_e t dy = \frac{3P}{4a^3} \int_0^a (a^2 + 4ay - 5y^2)dy
\]

\[
= \frac{3P}{4a^3} \left( a^2y + 4a \frac{y^2}{2} - 5 \frac{y^3}{3} \right) \bigg|_0^a
\]

\[
= \frac{3P}{4a^3} \left( a^3 + 2a^3 - \frac{5}{3}a^3 \right) = \frac{3P}{4a^3} \cdot \frac{4}{3}a^3 = P
\]
PROBLEM 6.80

For the angle shape and loading of Sample Prob. 6.6, (a) determine the points where the shearing stress is maximum and the corresponding values of the stress, (b) verify that the points obtained are located on the neutral axis corresponding to the given loading.

SOLUTION

Refer to Sample Prob. 6.6.

(a) Along vertical leg:

\[
\tau_e = \frac{3P(a - y)(a + 5y)}{4ta^3} = \frac{3P}{4ta^3}(a^2 + 4ay - 5y^2)
\]

\[
d\tau_e = \frac{3P}{4ta^3}(4a - 10y) = 0
\]

\[
y = \frac{2}{5}a \quad \uparrow
\]

\[
\tau_m = \frac{3P}{4ta^3} \left[ a^2 + (4a) \left( \frac{2}{5}a \right) - (5) \left( \frac{2}{5}a \right)^2 \right] = \frac{3P}{4ta^3} \left( \frac{9}{5}a^2 \right)
\]

\[
\tau_m = \frac{27P}{20ta} \quad \uparrow
\]

Along horizontal leg:

\[
\tau_f = \frac{3P(a - z)(a - 3z)}{4ta^3} = \frac{3P}{4ta^3}(a^2 - 4az + 3z^2)
\]

\[
d\tau_f = \frac{3P}{4ta^3}(-4a + 6z) = 0
\]

\[
z = \frac{2}{3}a \quad \uparrow
\]

\[
\tau_m = \frac{3P}{4ta^3} \left[ a^2 - (4a) \left( \frac{2}{3}a \right) + (3) \left( \frac{2}{3}a \right)^2 \right] = \frac{3P}{4ta^3} \left( -\frac{5}{3}a^2 \right)
\]

\[
\tau_m = -\frac{1P}{4ta} \quad \uparrow
\]

At the corner: \( y = 0, \ z = 0, \)

\[
\tau = \frac{3P}{4ta} \quad \uparrow

(b) \( I_y' = \frac{1}{3}ta^3 \quad I_x' = \frac{1}{12}ta^3 \quad \theta = 45^\circ \)

\[
\tan \varphi = \frac{I_x'}{I_y'} \quad \tan \theta = \frac{1}{4} \quad \varphi = 14.036^\circ
\]

\[
\theta - \varphi = 45 - 14.036 = 30.964^\circ
\]

\[
\bar{y} = \frac{\Sigma Ay}{\Sigma A} = \frac{at(a/2)}{2at} = \frac{1}{4}a

\[
\bar{z} = \frac{\Sigma Az}{\Sigma A} = \frac{at(a/2)}{2at} = \frac{1}{4}a

\( y = \frac{2}{5}a \) \text{  ◼️  }

Neutral axis intersects horizontal leg at

PROBLEM 6.81*

A steel plate, 160 mm wide and 8 mm thick, is bent to form the channel shown. Knowing that the vertical load \( P \) acts at a point in the midplane of the web of the channel, determine (a) the torque \( T \) that would cause the channel to twist in the same way that it does under the load \( P \), (b) the maximum shearing stress in the channel caused by the load \( P \).

SOLUTION

Use results of Example 6.06 with \( b = 30 \text{ mm}, \ h = 100 \text{ mm}, \) and \( t = 8 \text{ mm} \).

\[
e = \frac{b}{2 + \frac{b}{h}} = \frac{30}{2 + \frac{30}{100}} = 9.6429 \text{ mm} = 9.6429 \times 10^{-3} \text{ m}
\]

\[
I = \frac{t}{12} h^2(6b + h) = \frac{1}{12} (8)(100)^2[16(30) + 100] = 1.8667 \times 10^6 \text{ mm}^4 = 1.8667 \times 10^{-6} \text{ m}^4
\]

\( V = 15 \times 10^3 \text{ N} \)

(a) \( T = Ve = (15 \times 10^3)(9.6429 \times 10^{-3}) \)

\[
T = 144.64 \text{ N} \cdot \text{m} \uparrow
\]

Stress at neutral axis due to \( V \):

\[
Q = bt\left(\frac{h}{2}\right) + t\left(\frac{h}{4}\right) = \frac{1}{8} th(h + 4b)
\]

\[
= \frac{1}{8} (8)(100)[100 + (4)(30)] = 22 \times 10^3 \text{ mm}^3 = 22 \times 10^{-6} \text{ m}^3
\]

\( t = 8 \times 10^{-3} \text{ m} \)

\[
\tau_V = \frac{VQ}{It} = \frac{(15 \times 10^3)(22 \times 10^{-6})}{(1.8667 \times 10^{-6})(8 \times 10^{-3})} = 22.10 \times 10^6 \text{ Pa} = 22.10 \text{ MPa}
\]

Stress due to \( T \):

\( a = 2b + h = 160 \text{ mm} = 0.160 \text{ m} \)

\[
c_1 = \frac{1}{3} \left[ 1 - 0.630 \frac{t}{a} \right] = \frac{1}{3} \left[ 1 - (0.630) \frac{8}{160} \right] = 0.3228
\]

\[
\tau_T = \frac{T}{c_1at^2} = \frac{144.64}{(0.3228)(0.160)(8 \times 10^{-3})^2} = 43.76 \times 10^6 \text{ Pa} = 43.76 \text{ MPa}
\]

(b) By superposition, \( \tau_{\text{max}} = \tau_V + \tau_T \)

\( \tau_{\text{max}} = 65.9 \text{ MPa} \downarrow \)

\[ e = \frac{b}{2 + \frac{h}{3t}} = \frac{30}{2 + \frac{100}{(3)(30)}} = 9.6429 \text{ mm} = 9.6429 \times 10^{-3} \text{ m} \]

\[ I = \frac{1}{12}bh^2(6b + h) = \frac{1}{12}(6)(100)^2[(6)(30) + 100] = 1.400 \times 10^6 \text{ mm}^4 = 1.400 \times 10^{-6} \text{ m}^4 \]

\[ V = 15 \times 10^3 \text{ N} \]

(a)  
\[ T = Ve = (15 \times 10^3)(9.6429 \times 10^{-3}) \]

\[ t = 6 \times 10^{-3} \text{ m} \]

\[ \tau_V = \frac{VQ}{It} = \frac{(15 \times 10^3)(16.5 \times 10^{-6})}{(1.400 \times 10^{-6})(6 \times 10^{-6})} = 29.46 \times 10^6 \text{ Pa} = 29.46 \text{ MPa} \]

\[ \tau_T = \frac{T}{c_1 at^2} = \frac{144.64}{(0.32546)(0.160)(6 \times 10^{-3})^2} = 77.16 \times 10^6 \text{ Pa} = 77.16 \text{ MPa} \]

**PROBLEM 6.83**

The cantilever beam $AB$, consisting of half of a thin-walled pipe of 1.25-in. mean radius and $\frac{3}{8}$-in. wall thickness, is subjected to a 500-lb vertical load. Knowing that the line of action of the load passes through the centroid $C$ of the cross section of the beam, determine (a) the equivalent force-couple system at the shear center of the cross section, (b) the maximum shearing stress in the beam. *(Hint: The shear center $O$ of this cross section was shown in Prob. 6.73 to be located twice as far from its vertical diameter as its centroid $C$.)

**SOLUTION**

From the solution to Prob. 6.73,

\[ I = \frac{\pi}{2} a^3 t \quad Q = a^2 t \sin \theta \]

\[ e = \frac{4}{\pi} a \quad Q_{\text{max}} = a^2 t \]

For a half-pipe section, the distance from the center of the semi-circle to the centroid is

At each section of the beam, the shearing force $V$ is equal to $P$. Its line of action passes through the centroid $C$. The moment arm of its moment about the shear center $O$ is

\[ d = e - \bar{x} = \frac{4}{\pi} a - \frac{2}{\pi} a = \frac{2}{\pi} a \]

(a) **Equivalent force-couple system at $O$.**

\[ V = P \quad M_0 = Vd = \frac{2}{\pi} Pa \]

Data: $P = 500$ lb $\quad a = 1.25$ in.

\[ V = 500 \text{ lb} \quad \downarrow \]

\[ M_0 = \left(\frac{2}{\pi}\right)(500)(1.25) \quad M_0 = 398 \text{ lb} \cdot \text{in} \quad \downarrow \]
PROBLEM 6.83* (Continued)

(b) Shearing stresses.

(1) Due to \( V \): 
\[
\tau_v = \frac{VQ_{\text{max}}}{It}
\]
\[
\tau_v = \left( \frac{P}{\pi a^2 t} \right) \left( \frac{\pi a^3 t}{2} \right) = \frac{2P}{\pi at} = \frac{(2)(500)}{\pi(1.25)(0.375)} = 679 \text{ psi}
\]

(2) Due to the torque, \( M_0 \).

For a long rectangular section of length \( l \) and width \( t \), the shearing stress due to torque \( M_0 \) is
\[
\tau_M = \frac{M_0}{c_l t^2}
\]
where 
\[
c_l = \frac{1}{3(1 - 0.630 \frac{t}{l})}
\]

Data: 
\( l = \pi a = \pi(1.25) = 3.927 \text{ in.} \) \( t = 0.375 \text{ in.} \) \( c_l = 0.31328 \)
\[
\tau_M = \frac{397.9}{(0.31328)(3.927)(0.375)^2} = 2300 \text{ psi}
\]

By superposition, 
\( \tau = \tau_v + \tau_M = 679 \text{ psi} + 2300 \text{ psi} \) 
\( \tau = 2980 \text{ psi} \)
**PROBLEM 6.84**

Solve Prob. 6.83, assuming that the thickness of the beam is reduced to \( \frac{1}{4} \) in.

**PROBLEM 6.83** The cantilever beam \( AB \), consisting of half of a thin-walled pipe of 1.25-in. mean radius and \( \frac{3}{8} \)-in. wall thickness, is subjected to a 500-lb vertical load. Knowing that the line of action of the load passes through the centroid \( C \) of the cross section of the beam, determine \((a)\) the equivalent force-couple system at the shear center of the cross section, \((b)\) the maximum shearing stress in the beam. \(\text{Hint: The shear center } O \text{ of this cross section was shown in Prob. 6.73 to be located twice as far from its vertical diameter as its centroid } C.\) 

**SOLUTION**

From the solution to Prob. 6.73,

\[
I = \pi a^3 t \quad Q = a^2 t \sin \theta \\
e = \frac{4}{\pi} a \quad Q_{\text{max}} = a^3 t
\]

For a half-pipe section, the distance from the center of the semi-circle to the centroid is

\[
\bar{x} = \frac{2}{\pi} a
\]

At each section of the beam, the shearing force \( V \) is equal to \( P \). Its line of action passes through the centroid \( C \). The moment arm of its moment about the shear center \( O \) is

\[
d = e - \bar{x} = \frac{4}{\pi} a - \frac{2}{\pi} a = \frac{2}{\pi} a
\]

\((a)\) **Equivalent force-couple system at** \(O\)

\[
V = P \quad M_0 = Vd = \frac{2}{\pi} Pa
\]

Data:

\[
P = 500 \text{ lb} \quad a = 1.25 \text{ in.}
\]

\[
V = 500 \text{ lb} \quad M_0 = 398 \text{ lb} \cdot \text{in}
\]
(b) Shearing stresses.

1. Due to \( V \),\( \tau_v = \frac{VQ_{\text{max}}}{It} \)

\[
\tau_v = \frac{(P)(a^2t)}{\pi\frac{a}{2}t(t)} = \frac{2P}{\pi at} = \frac{(2)(500)}{\pi(1.25)(0.250)} = 1019 \text{ psi}
\]

2. Due to the torque, \( M_0 \),

For a long rectangular section of length \( l \) and width \( t \), the shearing stress due to torque \( M_0 \) is

\[
\tau_M = \frac{M_0}{c_1lt^2} \quad \text{where} \quad c_1 = \frac{1}{3} \left( 1 - 0.630 \frac{t}{l} \right)
\]

Data:

\[
l = \pi a = \pi(1.25) = 3.927 \text{ in.} \quad t = 0.250 \text{ in.} \quad c_3 = 0.31996
\]

\[
\tau_M = \frac{397.9}{(0.31996)(3.927)(0.250)^2} = 5067 \text{ psi}
\]

By superposition \( \tau = \tau_v + \tau_M = 1019 \text{ psi} + 5067 \text{ psi} \)

\[\tau = 6090 \text{ psi} \]
PROBLEM 6.85

The cantilever beam shown consists of a Z-shape of \( \frac{1}{4} \)-in. thickness. For the given loading, determine the distribution of the shearing stresses along line \( AB' \) in the upper horizontal leg of the Z-shape. The \( x' \) and \( y' \) axes are the principal centroidal axes of the cross section and the corresponding moments of inertia are \( I_{x'} = 166.3 \text{ in}^4 \) and \( I_{y'} = 13.61 \text{ in}^4 \).

SOLUTION

\[ V = 3 \text{ kips} \quad \beta = 22.5^\circ \]

\[ V_{x'} = V \sin \beta \quad V_{y'} = V \cos \beta \]

In upper horizontal leg, use coordinate \( x \): \((-6 \text{ in} \leq x \leq 0)\)

\[ A = \frac{1}{4}(6 + x) \text{ in.} \]

\[ x = \frac{1}{2}(-6 + x) \text{ in.} \]

\[ y = 6 \text{ in.} \]

\[ x' = x \cos \beta + y \sin \beta \]

\[ y' = y \cos \beta - x \sin \beta \]

Due to \( V_{x'} \):

\[ \tau_1 = \frac{V_{x'} A x'}{I_{x',t}} = \frac{(V \sin \beta) \left( \frac{1}{4} \right)(6 + x) \left[ \frac{1}{2}(-6 + x) \cos \beta + 6 \sin \beta \right]}{(13.61) \left( \frac{1}{4} \right)} \]

\[ = 0.084353(6 + x)(-0.47554 + 0.46194x) \]

Due to \( V_{y'} \):

\[ \tau_2 = \frac{V_{y'} A y'}{I_{x',t}} = \frac{(V \cos \beta) \left( \frac{1}{4} \right)(6 + x) \left[ 6 \cos \beta - \frac{1}{2}(-6 + x) \sin \beta \right]}{(166.3) \left( \frac{1}{4} \right)} \]

\[ = 0.0166665(6 + x)[6.69132 - 0.19134x] \]

Total:

\[ \tau_1 + \tau_2 = (6 + x)[-0.07141 + 0.035396x] \]

$$
t_{2} = \frac{(V \cos \beta) [10.037 + 4.1575 - 0.11548 y^2]}{(166.3) \frac{1}{4}} = 0.9463 - 0.00770 y^2

PROBLEM 6.89

A square box beam is made of two 20×80-mm planks and two 20×120-mm planks nailed together as shown. Knowing that the spacing between the nails is \( s = 30 \text{ mm} \) and that the vertical shear in the beam is \( V = 1200 \text{ N} \), determine (a) the shearing force in each nail, (b) the maximum shearing stress in the beam.

SOLUTION

\[
I = \frac{1}{12} b_2 h_2^3 - \frac{1}{12} b_1 h_1^3 \\
= \frac{1}{12} ((120)(120)^3) - \frac{1}{12} (80)(80)^3 = 13.8667 \times 10^6 \text{ mm}^4 \\
= 13.8667 \times 10^6 \text{ m}^4

(a) \( A_t = (120)(20) = 2400 \text{ mm}^2 \)

\[
\bar{y}_1 = 50 \text{ mm} \\
Q_t = A_t \bar{y}_1 = 120 \times 10^3 \text{ mm}^3 = 120 \times 10^{-6} \text{ m}^3
\]

\[
q = \frac{VQ}{I} = \frac{(1200)(120 \times 10^{-6})}{13.8667 \times 10^{-6}} = 10.385 \times 10^3 \text{ N/m}
\]

\[
q_s = 2F_{nail}
\]

\[
F_{nail} = \frac{qs}{2} = \frac{(10.385 \times 10^3)(30 \times 10^{-3})}{2}
\]

(b) \( Q = Q_t + (2)(20)(40)(20) \\

PROBLEM 6.90

The beam shown is fabricated by connecting two channel shapes and two plates, using bolts of \( \frac{3}{4} \)-in. diameter spaced longitudinally every 7.5 in. Determine the average shearing stress in the bolts caused by a shearing force of 25 kips parallel to the y-axis.

SOLUTION

C12×20.7: \( d = 12.00 \) in., \( I_x = 129 \) in\(^4\)

For top plate,

\[
\bar{y} = \frac{12.00}{2} + \left( \frac{1}{2} \right) \left( \frac{1}{2} \right) = 6.25 \text{ in.}
\]

\[
I_t = \frac{1}{12} \left( 16 \right) \left( \frac{1}{2} \right)^3 + \left( 16 \right) \left( \frac{1}{2} \right) (6.25)^2 = 312.667 \text{ in}^4
\]

For bottom plate,

\( I_b = 312.667 \) in\(^4\)

Moment of inertia of fabricated beam:

\[
I = (2)(129) + 312.667 + 312.667 = 883.33 \text{ in}^4
\]

\[
Q = A_{plate} \bar{y}_{plate} = (16) \left( \frac{1}{2} \right) (6.25) = 50 \text{ in}^3
\]

\[
g = \frac{VQ}{I} = \frac{(25)(50)}{883.33} = 1.41510 \text{ kips/in}
\]

\[
F_{bolt} = \frac{1}{2} gs = \left( \frac{1}{2} \right) (1.41510)(7.5) = 5.3066 \text{ kips}
\]

\[
A_{bolt} = \frac{\pi}{4} \left( d_{bolt} \right)^2 = \frac{\pi}{4} \left( \frac{3}{4} \right)^2 = 0.44179 \text{ in}^2
\]

\[
\tau_{bolt} = \frac{F_{bolt}}{A_{bolt}} = \frac{5.3066}{0.44179} = 12.01 \text{ ksi}
\]

\( \tau_{bolt} = 12.01 \) ksi
PROBLEM 6.91

For the beam and loading shown, consider section n-n and determine (a) the largest shearing stress in that section, (b) the shearing stress at point a.

SOLUTION

\[ \Sigma M_B = 0: -2.3A + (1.5)(72) = 0 \]
\[ A = 46.957 \text{ kN} \uparrow \]

At section n-n, \[ V = A = 46.957 \text{ kN} \]

Calculate moment of inertia:

\[ I = 2 \left[ \frac{1}{12} (15)(40)^3 \right] + 2 \left[ \frac{1}{12} (15)(80)^3 \right] + \frac{1}{12} (30)(120)^3 \]
\[ = 5.76 \times 10^6 \text{ mm}^4 = 5.76 \times 10^{-6} \text{ m}^4 \]

At a,

\[ t_a = 30 \text{ mm} = 0.030 \text{ m} \]
\[ Q_a = (30 \times 20)(50) = 30 \times 10^3 \text{ mm}^3 \]
\[ = 30 \times 10^{-6} \text{ m}^3 \]
\[ \tau_a = \frac{VQ_a}{It_a} = \frac{(46.957 \times 10^3)(30 \times 10^{-6})}{(5.76 \times 10^{-6})(0.030)} \]
\[ = 8.15 \times 10^6 \text{ Pa} = 8.15 \text{ MPa} \]

At b,

\[ t_b = 60 \text{ mm} = 0.060 \text{ m} \]
\[ Q_b = Q_a + (60 \times 20)(30) = 30 \times 10^3 + 36 \times 10^3 = 66 \times 10^3 \text{ mm}^3 = 66 \times 10^{-6} \text{ m}^4 \]
\[ \tau_b = \frac{VQ_b}{It_b} = \frac{(46.957 \times 10^3)(66 \times 10^{-6})}{(5.76 \times 10^{-6})(0.060)} \]
\[ = 8.97 \times 10^6 \text{ Pa} = 8.97 \text{ MPa} \]

At NA,

\[ t_{NA} = 90 \text{ mm} = 0.090 \text{ m} \]
\[ Q_{NA} = Q_b + (90 \times 20)(10) = 66 \times 10^3 + 18 \times 10^3 = 84 \times 10^3 \text{ mm}^3 = 84 \times 10^{-6} \text{ m}^3 \]
\[ \tau_{NA} = \frac{VQ_{NA}}{It_{NA}} = \frac{(46.957 \times 10^3)(84 \times 10^{-6})}{(5.76 \times 10^{-6})(0.090)} \]
\[ = 7.61 \times 10^6 \text{ Pa} = 7.61 \text{ MPa} \]

(a) \[ \tau_{\text{max}} \text{ occurs at } b. \]
\[ \tau_{\text{max}} = 8.97 \text{ MPa} \]

(b) \[ \tau_a = 8.15 \text{ MPa} \]
**PROBLEM 6.92**

For the beam and loading shown, determine the minimum required width \( b \), knowing that for the grade of timber used, \( \sigma = 12 \text{ MPa} \) and \( \tau = 825 \text{ kPa} \).

**SOLUTION**

\[ \sum M_D = 0: \quad -3A + (2)(2.4) + (1)(4.8) - (0.5)(7.2) = 0 \]

\[ A = 2 \text{ kN} \uparrow \]

Draw the shear and bending moment diagrams.

\[ |V|_{\max} = 7.2 \text{ kN} = 7.2 \times 10^3 \text{ N} \]

\[ |M|_{\max} = 3.6 \text{ kN} \cdot \text{m} = 3.6 \times 10^3 \text{ N} \cdot \text{m} \]

**Bending:**

\[ \sigma = \frac{M}{S} \]

\[ S_{\min} = \frac{|M|_{\max}}{\sigma} = \frac{3.6 \times 10^3}{12 \times 10^6} = 300 \times 10^{-6} \text{ m}^3 = 0.3 \text{ mm}^3 \]

For a rectangular section,

\[ S = \frac{bh^2}{6} \]

\[ b = \frac{6S}{h^2} = \frac{(6)(300 \times 10^3)}{(150)^2} = 80 \text{ mm} \]

**Shear:** Maximum shearing stress occurs at the neutral axis of bending for a rectangular section.

\[ A = \frac{1}{2} bh, \quad \bar{y} = \frac{1}{4} h, \quad Q = A\bar{y} = \frac{1}{8} bh^2 \]

\[ I = \frac{1}{12} bh^3 \quad t = b \]

\[ \tau = \frac{VQ}{It} = \frac{V(\frac{1}{8} bh^2)}{(\frac{1}{12} bh^3)(b)} = \frac{3V}{2bh} \]

\[ b = \frac{3V}{2h\tau} = \frac{(3)(7.2 \times 10^3)}{2(150 \times 10^{-3})(825 \times 10^3)} = 87.3 \times 10^{-3} \text{ m} \]

**PROBLEM 6.95**

The composite beam shown is made by welding C200×17.1 rolled-steel channels to the flanges of a W250×80 wide-flange rolled-steel shape. Knowing that the beam is subjected to a vertical shear of 200 kN, determine (a) the horizontal shearing force per meter at each weld, (b) the shearing stress at point a of the flange of the wide-flange shape.

---

**SOLUTION**

For W250×80, \( d = 257 \text{ mm}, \quad t_f = 15.6 \text{ mm}, \quad I_x = 126 \times 10^6 \text{ mm}^4 \)

For C200×17.1, \( A = 2170 \text{ mm}^2, \quad b_f = 57.4 \text{ mm}, \quad t_f = 9.91 \text{ mm} \)

\[ I_y = 0.545 \times 10^6 \text{ mm}^4, \quad \bar{x} = 14.5 \text{ mm} \]

For the channel in the composite beam,

\[ \bar{y}_c = \frac{257}{2} + 57.4 - 14.5 = 171.4 \text{ mm} \]

For the composite beam,

\[ I = 126 \times 10^6 + 2 \left[ 0.545 \times 10^6 + (2170)(171.4)^2 \right] \]

\[ = 254.59 \times 10^6 \text{ mm}^4 = 254.59 \times 10^{-6} \text{ m}^4 \]

(a) For the two welds,

\[ Q_w = A \bar{y}_c = (2170)(171.4) = 371.94 \times 10^3 \text{ mm}^3 = 371.94 \times 10^{-6} \text{ m}^3 \]

\[ q = \frac{VQ}{I} = \frac{(200 \times 10^3)(371.94 \times 10^{-6})}{254.59 \times 10^{-6}} = 292.2 \times 10^3 \text{ N/m} \]

For one weld,

\[ \frac{q}{2} = 146.1 \times 10^3 \text{ N/m} \]

Shearing force per meter of weld: 146.1 kN/m

(b) For cuts at \( a \) and \( a' \) together,

\[ A_a = 2(112)(15.6) = 3494.4 \text{ mm}^2 \quad \bar{y}_a = \frac{257}{2} - \frac{15.6}{2} = 120.7 \text{ mm} \]

\[ Q_a = 371.94 \times 10^3 + (3494.4)(120.7) = 793.71 \times 10^3 \text{ mm}^3 = 793.71 \times 10^{-6} \text{ m}^3 \]

Since there are cuts at \( a \) and \( a' \), \( t = 2t_f = (2)(15.6) = 31.2 \text{ mm} = 0.0312 \text{ m} \).

\[ \tau_a = \frac{VQ_a}{It} = \frac{(200 \times 10^3)(793.71 \times 10^{-6})}{(254.59 \times 10^6)(0.0312)} = 19.99 \times 10^6 \text{ Pa} \]

\[ \tau_a = 19.99 \text{ MPa} \]

\[ \tan \alpha = \frac{16}{30} \Rightarrow \alpha = 28.07^\circ \]

\[ A = (3 \text{ sec } \alpha)(30) = 102 \text{ mm}^2 \]

**PROBLEM 6.97**

The design of a beam requires welding four horizontal plates to a vertical 0.5 × 5-in. plate as shown. For a vertical shear $V$, determine the dimension $h$ for which the shear flow through the welded surface is maximum.

**SOLUTION**

Horizontal plate:

$$I_h = \frac{1}{12} (4.5)(0.5)^3 + (4.5)(0.5)h^2$$

$$= 0.046875 + 2.25h^2$$

Vertical plate:

$$I_v = \frac{1}{12} (0.5)(5)^3 = 5.2083 \text{ in}^4$$

Whole section:

$$I = 4I_h + I_v = 9h^2 + 5.39583 \text{ in}^4$$

For one horizontal plate,

$$Q = (4.5)(0.5)h = 2.25h \text{ in}^3$$

$$q = \frac{VQ}{I} = \frac{2.25Vh}{9h^2 + 5.39583}$$

To maximize $q$, set

$$\frac{dq}{dh} = 0.$$

$$2.25V\left(9h^2 + 5.39583\right) - 18h^2 = 0 \quad h = 0.774 \text{ in.} \blacktriangle$$

$q = \frac{VQ}{l} = \frac{100Vtx}{l}$

$F_1 = \int_{x=0}^{x=60} qdx = 100 \frac{Vt}{I} \int_{0}^{60} xdx$

$= \frac{(100)(60)^2}{2} \frac{Vt}{I} = 180 \times 10^3 \frac{Vt}{I}$

Part $DE$:

$A = tx, \quad \bar{y} = 80 \text{ mm}, \quad Q = 80 \text{ tx}$

$q = \frac{VQ}{l} = \frac{80Vtx}{l}$

$F_2 = \int_{x=0}^{x=b} qdx = 80 \frac{Vt}{I} \int_{0}^{b} xdx$

$\sum M_0 = 0: \quad (200)(180 \times 10^3) \frac{Vt}{I} - (160)(40b^2) \frac{Vt}{I} = 0$

$b^2 = \frac{(200)(180 \times 10^3)}{(160)(40)} = 5625 \text{ mm}^2$

$b = 75.0 \text{ mm}$

A steel pipe of 12-in. outer diameter is fabricated from $\frac{1}{4}$-in.-thick plate by welding along a helix that forms an angle of 22.5° with a plane perpendicular to the axis of the pipe. Knowing that a 40-kip axial force $P$ and an 80-kip in. torque $T$, each directed as shown, are applied to the pipe, determine $\sigma$ and $\tau$ in directions, respectively, normal and tangential to the weld.

SOLUTION

\[ d_2 = 12 \text{ in.}, \quad c_2 = \frac{1}{2}d_2 = 6 \text{ in.}, \quad t = 0.25 \text{ in.} \]
\[ c_1 = c_2 - t = 5.75 \text{ in.} \]
\[ A = \pi \left( c_2^2 - c_1^2 \right) = \pi \left( 6^2 - 5.75^2 \right) = 9.2284 \text{ in}^2 \]

PROBLEM 7.24

A mechanic uses a crowfoot wrench to loosen a bolt at E. Knowing that the mechanic applies a vertical 24-lb force at A, determine the principal stresses and the maximum shearing stress at point H located as shown on top of the \( \frac{3}{4} \)-in. diameter shaft.

SOLUTION

Equivalent force-couple system at center of shaft in section at point H:

\[
V = 24 \text{ lb} \quad M = (24)(6) = 144 \text{ lb \cdot in}
\]
\[
T = (24)(10) = 240 \text{ lb \cdot in}
\]

Shaft cross section: \( d = 0.75 \text{ in.}, \quad c = \frac{1}{2}d = 0.375 \text{ in.} \)

\[
J = \frac{\pi}{2} c^4 = 0.031063 \text{ in}^4 \quad I = \frac{1}{2} J = 0.015532 \text{ in}^4
\]

Torsion:

\[
\tau = \frac{Tc}{J} = \frac{(240)(0.375)}{0.031063} = 2.897 \times 10^3 \text{ psi} = 2.897 \text{ ksi}
\]

Bending:

\[
\sigma = \frac{Mc}{I} = \frac{(144)(0.375)}{0.015532} = 3.477 \times 10^3 \text{ psi} = 3.477 \text{ ksi}
\]

Transverse shear: At point H, the stress due to transverse shear is zero.

Resultant stresses:

\[
\sigma_x = 3.477 \text{ ksi}, \quad \sigma_y = 0, \quad \tau_{xy} = 2.897 \text{ ksi}
\]

\[
\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 1.738 \text{ ksi}
\]

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{1.738^2 + 2.897^2} = 3.378 \text{ ksi}
\]

\[
\sigma_a = \sigma_{ave} + R \\
\sigma_b = \sigma_{ave} - R \\
\tau_{\max} = R
\]

\[
\sigma_a = 5.12 \text{ ksi} \quad \sigma_b = -1.640 \text{ ksi} \quad \tau_{\max} = 3.38 \text{ ksi}
\]
PROBLEM 7.25

The steel pipe $AB$ has a 102-mm outer diameter and a 6-mm wall thickness. Knowing that arm $CD$ is rigidly attached to the pipe, determine the principal stresses and the maximum shearing stress at point $K$.

SOLUTION

\[
r_o = \frac{d_o}{2} = \frac{102}{2} = 51 \text{ mm} \\
r_i = r_o - t = 45 \text{ mm}
\]

\[
J = \frac{\pi}{2} \left( r_o^4 - r_i^4 \right) = 4.1855 \times 10^6 \text{ mm}^4
\]

\[
I = \frac{1}{2} J = 2.0927 \times 10^{-6} \text{ m}^4
\]

Force-couple system at center of tube in the plane containing points $H$ and $K$:

\[
F_x = 10 \text{ kN} = 10 \times 10^3 \text{ N}
\]

\[
M_y = (10 \times 10^3)(200 \times 10^{-3}) = 2000 \text{ N} \cdot \text{m}
\]

\[
M_z = -(10 \times 10^3)(150 \times 10^{-3}) = -1500 \text{ N} \cdot \text{m}
\]

**Torsion:** At point $K$, place local $x$-axis in negative global $z$-direction.

\[
T = M_y = 2000 \text{ N} \cdot \text{m}
\]

\[
c = r_o = 51 \times 10^{-3} \text{ m}
\]

\[
\tau_{xy} = \frac{Tc}{J} = \frac{(2000)(51 \times 10^{-3})}{4.1855 \times 10^6} = 24.37 \times 10^6 \text{ Pa}
\]

\[
= 24.37 \text{ MPa}
\]
Transverse shear: Stress due to transverse shear \( V = F_y \) is zero at point \( K \).

Bending:

\[
|\sigma_y| = \frac{|M_y|c}{I} = \frac{(1500)(51 \times 10^{-3})}{2.0927 \times 10^{-6}} = 36.56 \times 10^6 \text{Pa} = 36.56 \text{MPa}
\]

Point \( K \) lies on compression side of neutral axis:

\[\sigma_y = -36.56 \text{MPa}\]

Total stresses at point \( K \):

\[
\sigma_x = 0, \quad \sigma_y = -36.56 \text{MPa}, \quad \tau_{xy} = 24.37 \text{MPa}
\]

\[
\sigma_{\text{ave}} = \frac{1}{2}(\sigma_x + \sigma_y) = -18.28 \text{MPa}
\]

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = 30.46 \text{MPa}
\]

\[
\sigma_{\text{max}} = \sigma_{\text{ave}} + R = -18.28 + 30.46 = 12.18 \text{MPa} \quad \sigma_{\text{max}} = 12.18 \text{MPa}
\]

\[
\sigma_{\text{min}} = \sigma_{\text{ave}} - R = -18.28 - 30.46 = -48.7 \text{MPa} \quad \sigma_{\text{min}} = -48.7 \text{MPa}
\]

\[
\tau_{\text{max}} = R = 30.5 \text{MPa}
\]
PROBLEM 7.26

The axle of an automobile is acted upon by the forces and couple shown. Knowing that the diameter of the solid axle is 32 mm, determine (a) the principal planes and principal stresses at point \( H \) located on top of the axle, (b) the maximum shearing stress at the same point.

SOLUTION

\[ c = \frac{1}{2} d = \frac{1}{2}(32) = 16 \text{ mm} = 16 \times 10^{-3} \text{ m} \]

Torsion:

\[ \tau = \frac{Tc}{J} = \frac{2T}{\pi c^3} = \frac{2(350 \text{ N} \cdot \text{m})}{\pi(16 \times 10^{-3} \text{ m})^3} = 54,399 \times 10^6 \text{ Pa} = 54.399 \text{ MPa} \]

Bending:

\[ I = \frac{\pi}{4} c^4 = \frac{\pi}{4} (16 \times 10^{-3})^4 = 51.472 \times 10^{-9} \text{ m}^4 \]

\[ M = (0.15 \text{ m})(3 \times 10^3 \text{ N}) = 450 \text{ N} \cdot \text{m} \]

\[ \sigma = -\frac{My}{I} = -\frac{(450)(16 \times 10^{-3})}{51.472 \times 10^{-9}} = -139.882 \times 10^6 \text{ Pa} = -139.882 \text{ MPa} \]

Top view:

Stresses:

\[ \sigma_x = -139.882 \text{ MPa} \quad \sigma_y = 0 \quad \tau_{xy} = -54.399 \text{ MPa} \]

\[ \sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = \frac{1}{2}(-139.882 + 0) = -69.941 \text{ MPa} \]

\[ R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{(-69.941)^2 + (-54.399)^2} = 88.606 \text{ MPa} \]

(a) \[ \sigma_{max} = \sigma_{ave} + R = -69.941 + 88.606 \]

\[ \sigma_{min} = \sigma_{ave} - R = -69.941 - 88.606 \]

PROBLEM 7.27

For the state of plane stress shown, determine (a) the largest value of \( \tau_{xy} \) for which the maximum in-plane shearing stress is equal to or less than 12 ksi, (b) the corresponding principal stresses.

SOLUTION

\[ \sigma_x = 10 \text{ ksi}, \quad \sigma_y = -8 \text{ ksi}, \quad \tau_{xy} = ? \]

\[ \tau_{\text{max}} = R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{z}\right)^2 + \tau_{xy}^2} = \sqrt{\left(\frac{10 - (-8)}{z}\right)^2 + \tau_{xy}^2} \]

\[ = \sqrt{9^2 + \tau_{xy}^2} = 12 \text{ ksi} \]

(a) \[ \tau_{xy} = \sqrt{12^2 - 9^2} \quad \tau_{xy} = 7.94 \text{ ksi} \]

(b) \[ \sigma_{\text{ave}} = \frac{1}{2}(\sigma_x + \sigma_y) = 1 \text{ ksi} \]

\[ \sigma_a = \sigma_{\text{ave}} + R = 1 + 12 = 13 \text{ ksi} \quad \sigma_a = 13.00 \text{ ksi} \]

\[ \sigma_b = \sigma_{\text{ave}} - R = 1 - 12 = -11 \text{ ksi} \quad \sigma_b = -11.00 \text{ ksi} \]
PROBLEM 7.28

For the state of plane stress shown, determine the largest value of $\sigma_y$ for which the maximum in-plane shearing stress is equal to or less than 75 MPa.

SOLUTION

$$\sigma_x = 60 \text{ MPa}, \quad \sigma_y = ?, \quad \tau_{xy} = 20 \text{ MPa}$$

Let

$$u = \frac{\sigma_x - \sigma_y}{2}.$$  

Then

$$\sigma_y = \sigma_x - 2u$$

$$R = \sqrt{u^2 + \tau_{xy}^2} = 75 \text{ MPa}$$

$$u = \pm \sqrt{R^2 - \tau_{xy}^2} = \pm \sqrt{75^2 - 20^2} = 72.284 \text{ MPa}$$

$$\sigma_y = \sigma_x - 2u = 60 \mp (2)(72.284) = -84.6 \text{ MPa} \quad \text{or} \quad 205 \text{ MPa}$$

Largest value of $\sigma_y$ is required.

$\sigma_y = 205 \text{ MPa}$
PROBLEM 7.29

Determine the range of values of $\sigma_x$ for which the maximum in-plane shearing stress is equal to or less than 10 ksi.

SOLUTION

$\sigma_x = ?, \quad \sigma_y = 15 \text{ ksi, } \tau_{xy} = 8 \text{ ksi}$

Let $u = \frac{\sigma_x - \sigma_y}{2} \quad \sigma_x = \sigma_y + 2u$

$R = \sqrt{u^2 + \tau_{xy}^2} = \tau_{\max} = 10 \text{ ksi}$

$u = \pm \sqrt{R^2 - \tau_{xy}^2} = \pm \sqrt{10^2 - 8^2} = \pm 6 \text{ ksi}$

$\sigma_x = \sigma_y + 2u = 15 \pm (2)(6) = 27 \text{ ksi or 3 ksi}$

Allowable range: $3 \text{ ksi} \leq \sigma_x \leq 27 \text{ ksi}$
PROBLEM 7.30

For the state of plane stress shown, determine (a) the value of $\tau_{xy}$ for which the in-plane shearing stress parallel to the weld is zero, (b) the corresponding principal stresses.

SOLUTION

$$\sigma_x = 12 \text{ MPa}, \quad \sigma_y = 2 \text{ MPa}, \quad \tau_{xy} = ?$$

Since $\tau_{xy} = 0$, $x'$-direction is a principal direction.

$$\theta_p = -15^\circ$$

$$\tan 2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y}$$

(a) $$\tau_{xy} = \frac{1}{2} (\sigma_x - \sigma_y) \tan 2\theta_p = \frac{1}{2} (12 - 2) \tan(-30^\circ)$$

$$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{5^2 + 2.89^2} = 5.7735 \text{ MPa}$$

$$\sigma_{\text{ave}} = \frac{1}{2} (\sigma_x + \sigma_y) = 7 \text{ MPa}$$

(b) $$\sigma_a = \sigma_{\text{ave}} + R = 7 + 5.7735$$

$$\sigma_b = \sigma_{\text{ave}} - R = 7 - 5.7735$$

$$\sigma_a = 12.77 \text{ MPa}$$

$$\sigma_b = 1.226 \text{ MPa}$$

PROBLEM 7.51
Solve Prob. 7.29, using Mohr’s circle.

PROBLEM 7.29 Determine the range of values of $\sigma_x$ for which the maximum in-plane shearing stress is equal to or less than 10 ksi.

SOLUTION
For the Mohr’s circle, point $Y$ lies at (15 ksi, 8 ksi). The radius of limiting circles is $R = 10$ ksi.
Let $C_1$ be the location of the leftmost limiting circle and $C_2$ be that of the rightmost one.

$$\frac{C_1Y}{C_2Y} = 10 \text{ ksi}$$

$$\frac{C_1D}{C_2D} = 10 \text{ ksi}$$

Noting right triangles $C_1DY$ and $C_2DY$,

$$\frac{C_1D^2}{C_2D^2} + \frac{DY^2}{8^2} = \frac{C_1Y^2}{10^2} \quad \frac{C_1D^2}{C_2D^2} + 8^2 = 10^2 \quad C_1D = 6 \text{ ksi}$$

Coordinates of point $C_1$ are $(0, 15 - 6) = (0, 9 \text{ ksi})$.
Likewise, coordinates of point $C_2$ are $(0, 15 + 6) = (0, 21 \text{ ksi})$.
Coordinates of point $X_1$: $(9 - 6, -8) = (3 \text{ ksi}, -8 \text{ ksi})$
Coordinates of point $X_2$: $(21 + 6, -8) = (27 \text{ ksi}, -8 \text{ ksi})$
The point $(\sigma_x, -\tau_{xy})$ must lie on the line $X_1X_2$.
Thus, $3 \text{ ksi} \leq \sigma_x \leq 27 \text{ ksi}$
**PROBLEM 7.52**

Solve Prob. 7.30, using Mohr’s circle.

**PROBLEM 7.30** For the state of plane stress shown, determine \((a)\) the value of \(\tau_{xy}\) for which the in-plane shearing stress parallel to the weld is zero, \((b)\) the corresponding principal stresses.

**SOLUTION**

Point \(X\) of Mohr’s circle must lie on \(X'X''\) so that \(\sigma_x = 12\) MPa. Likewise, point \(Y\) lies on line \(Y'Y''\) so that \(\sigma_y = 2\) MPa. The coordinates of \(C\) are

\[
\frac{2 + 12}{2}, \quad 0 = (7\ \text{MPa}, 0).
\]

Counterclockwise rotation through 150° brings line \(CX\) to \(CB\), where \(\tau = 0\).

\[
R = \frac{\sigma_x - \sigma_y}{2} \sec 30^\circ = \frac{12 - 2}{2} \sec 30^\circ = 5.77\ \text{MPa}
\]

\((a)\)

\[
\tau_{xy} = -\frac{\sigma_x - \sigma_y}{2} \tan 30^\circ
\]

\[
= -\frac{12 - 2}{2} \tan 30^\circ
\]

\(\tau_{xy} = -2.89\ \text{MPa} \ ▲
\]

\((b)\)

\[
\sigma_a = \sigma_{\text{ave}} + R = 7 + 5.77
\]

\[
\sigma_a = 12.77\ \text{MPa} \ ▲
\]

\[
\sigma_b = \sigma_{\text{ave}} - R = 7 - 5.77
\]

\[
\sigma_b = 1.23\ \text{MPa} \ ▲
\]
**PROBLEM 7.53**

Solve Problem 7.30, using Mohr’s circle and assuming that the weld forms an angle of 60° with the horizontal.

**PROBLEM 7.30** For the state of plane stress shown, determine (a) the value of $\tau_{xy}$ for which the in-plane shearing stress parallel to the weld is zero, (b) the corresponding principal stresses.

**SOLUTION**

Locate point $C$ at $\sigma = \frac{12 + 2}{2} = 7 \text{ MPa}$ with $\tau = 0$.

Angle $XCB = 120^\circ$

$$\frac{\sigma_x - \sigma_y}{2} = \frac{12 - 2}{2} = 5 \text{ MPa}$$

$$R = 5 \sec 60^\circ$$

$$= 10 \text{ MPa}$$

$$\tau_{xy} = -5 \tan 60^\circ$$

$$\tau_{xy} = -8.66 \text{ MPa}$$

$$\sigma_a = \sigma_{ave} + R$$

$$= 7 + 10$$

$$\sigma_a = 17 \text{ MPa}$$

$$\sigma_b = \sigma_{ave} - R$$

$$= 7 - 10$$

$$\sigma_b = -3 \text{ MPa}$$
PROBLEM 7.54

Determine the principal planes and the principal stresses for the state of plane stress resulting from the superposition of the two states of stress shown.

SOLUTION

Mohr’s circle for 1st stress state.

Resultant stresses:

\[
\begin{align*}
\sigma_x &= 4 + 4 = 8 \text{ ksi} \\
\sigma_y &= -4 + 7 = 3 \text{ ksi} \\
\tau_{xy} &= 6 + 0 = 6 \text{ ksi}
\end{align*}
\]

\[
\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 5.5 \text{ ksi}
\]

\[
\tan 2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \frac{(2)(6)}{5} = 2.4
\]

\[
2\theta_p = 67.38^\circ
\]

\[
\theta_a = 33.69^\circ \quad \theta_b = 123.69^\circ
\]

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{2.5^2 + 6^2} = 6.5 \text{ ksi}
\]

\[
\sigma_a = \sigma_{ave} + R = 12 \text{ ksi}
\]

\[
\sigma_b = \sigma_{ave} - R = -1 \text{ ksi}
\]
**PROBLEM 7.55**

Determine the principal planes and the principal stresses for the state of plane stress resulting from the superposition of the two states of stress shown.

**SOLUTION**

Mohr’s circle for 2nd stress state:

\[
\begin{align*}

&= 30 \text{ MPa} \\
\sigma_y &= 20 - 20 \cos 60^\circ \\
&= 10 \text{ MPa} \\
\tau_{xy} &= 20 \sin 60^\circ \\
&= 17.32 \text{ MPa}
\end{align*}
\]

Resultant stresses:

\[
\begin{align*}
\sigma_x &= 35 + 30 = 65 \text{ MPa} \\
\sigma_y &= 25 + 10 = 35 \text{ MPa} \\
\tau_{xy} &= 0 + 17.32 = 17.32 \text{ MPa}
\end{align*}
\]

\[
\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = \frac{1}{2}(65 + 35) = 50 \text{ MPa}
\]

\[
\tan 2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \frac{(2)(17.32)}{65 - 35} = 1.1547
\]

\[
2\theta_p = 49.11^\circ, \quad \theta_a = 24.6^\circ, \quad \theta_b = 114.6^\circ
\]

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = 22.91 \text{ MPa}
\]

\[
\sigma_a = \sigma_{ave} + R \quad \sigma_a = 72.91 \text{ MPa}
\]

\[
\sigma_b = \sigma_{ave} - R \quad \sigma_b = 27.09 \text{ MPa}
\]
PROBLEM 7.56

Determine the principal planes and the principal stresses for the state of plane stress resulting from the superposition of the two states of stress shown.

SOLUTION

Mohr’s circle for 2nd stress state:

\[ \sigma_x = \frac{1}{2} \sigma_0 + \frac{1}{2} \sigma_0 \cos 2\theta \]
\[ \sigma_y = \frac{1}{2} \sigma_0 - \frac{1}{2} \sigma_0 \cos 2\theta \]
\[ \tau_{xy} = \frac{1}{2} \sigma_0 \sin 2\theta \]

Resultant stresses:

\[ \sigma_x = \sigma_0 + \frac{1}{2} \sigma_0 + \frac{1}{2} \sigma_0 \cos 2\theta = \frac{3}{2} \sigma_0 + \frac{1}{2} \sigma_0 \cos 2\theta \]
\[ \sigma_y = 0 + \frac{1}{2} \sigma_0 - \frac{1}{2} \sigma_0 \cos 2\theta = \frac{1}{2} \sigma_0 - \frac{1}{2} \sigma_0 \cos 2\theta \]
\[ \tau_{xy} = 0 + \frac{1}{2} \sigma_0 \sin 2\theta = \frac{1}{2} \sigma_0 \sin 2\theta \]
\[ \sigma_{ave} = \frac{1}{2} (\sigma_x + \sigma_y) = \sigma_0 \]
\[ \tan 2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \frac{\sigma_0 \sin 2\theta}{\sigma_0 + \sigma_0 \cos 2\theta} \]
\[ = \frac{\sin 2\theta}{1 + \cos 2\theta} = \tan \theta \]

\[ R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{\left(\frac{1}{2} \sigma_0 + \frac{1}{2} \sigma_0 \cos 2\theta + \frac{1}{2} \sigma_0 \sin 2\theta\right)^2 + \left(\frac{1}{2} \sigma_0 \sin 2\theta\right)^2} \]
\[ = \frac{1}{2} \sigma_0 \sqrt{1 + 2 \cos 2\theta + \cos^2 2\theta} = \frac{\sqrt{2}}{2} \sigma_0 \sqrt{1 + \cos 2\theta} = \sigma_0 \cos \theta \]
\[ \sigma_a = \sigma_{ave} + R \]
\[ \sigma_b = \sigma_{ave} - R \]
PROBLEM 7.57

Determine the principal planes and the principal stresses for the state of plane stress resulting from the superposition of the two states of stress shown.

SOLUTION

Mohr’s circle for 2nd state of stress:

\[ \sigma_x = 0 \]
\[ \sigma_y = 0 \]
\[ \tau_{xy} = \tau_0 \]

Resultant stresses:

\[ \sigma_x = 0 - \frac{\sqrt{3}}{2} \tau_0 = -\frac{\sqrt{3}}{2} \tau_0 \]
\[ \sigma_y = 0 + \frac{\sqrt{3}}{2} \tau_0 = \frac{\sqrt{3}}{2} \tau_0 \]
\[ \tau_{xy} = \tau_0 + \frac{1}{2} \tau_0 = \frac{3}{2} \tau_0 \]
\[ \sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 0 \]
\[ R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{\left(\frac{\sqrt{3}}{2} \tau_0\right)^2 + \left(\frac{3}{2} \tau_0\right)^2} = \sqrt{3} \tau_0 \]
\[ \tan 2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \frac{2 \left(\frac{3}{2}\right)}{-\frac{\sqrt{3}}{2}} = \sqrt{3} \]
\[ 2\theta_p = -60^\circ \]
\[ \sigma_a = \sigma_{ave} + R \]
\[ \sigma_b = \sigma_{ave} - R \]
PROBLEM 7.58

For the state of stress shown, determine the range of values of $\theta$ for which the magnitude of the shearing stress $\tau_{xy}$ is equal to or less than 8 ksi.

SOLUTION

For states of stress corresponding to arcs HBK and UAV of Mohr’s circle. The angle $\varphi$ is calculated from

$\tau_{xy} = \frac{1}{2}(\sigma_x + \sigma_y) = -8 \text{ ksi}$

$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$

$R = \sqrt{(-8)^2 + (6)^2} = 10 \text{ ksi}$

$2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \frac{(2)(6)}{-16} = -0.75$

$2\theta_p = -36.870^\circ$

$\theta_p = -18.435^\circ$

$|\tau_{xy}| \leq 8 \text{ ksi}$

$R \sin 2\varphi = 8$

$\sin 2\varphi = \frac{8}{10} = 0.8$

$2\varphi = 53.130^\circ$

$\varphi = 26.565^\circ$

$\theta_h = \theta_b - \varphi = -18.435^\circ - 26.565^\circ = -45^\circ$

$\theta_k = \theta_b + \varphi = -18.435 + 26.565^\circ = 8.13^\circ$

$\theta_a = \theta_h + 90^\circ = 45^\circ$

$\theta_v = \theta_k + 90^\circ = 98.13^\circ$

Permissible range of $\theta$:

$\theta_h \leq \theta \leq \theta_k$

$\theta_a \leq \theta \leq \theta_v$

$-45^\circ \leq \theta \leq 8.13^\circ$

$45^\circ \leq \theta \leq 98.13^\circ$

Also,

$135^\circ \leq \theta \leq 188.13^\circ$ and $225^\circ \leq \theta \leq 278.13^\circ$
PROBLEM 7.59

For the state of stress shown, determine the range of values of \( \theta \) for which the normal stress \( \sigma' \) is equal to or less than 50 MPa.

SOLUTION

\[ \sigma_x = 90 \text{ MPa}, \quad \sigma_y = 0 \]
\[ \tau_{xy} = -60 \text{ MPa} \]
\[ \sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 45 \text{ MPa} \]
\[ R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} \]
\[ = \sqrt{45^2 + 60^2} = 75 \text{ MPa} \]
\[ \tan 2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \frac{(2)(-60)}{90} = -\frac{4}{3} \]
\[ 2\theta_p = -53.13^\circ \]
\[ \theta_a = -26.565^\circ \]

\( \sigma' \leq 50 \text{ MPa} \) for states of stress corresponding to the arc \( HBK \) of Mohr’s circle. From the circle,

\[ R \cos 2\varphi = 50 - 45 = 5 \text{ MPa} \]
\[ \cos 2\varphi = \frac{5}{75} = 0.066667 \]
\[ 2\varphi = 86.177^\circ \quad \varphi = 43.089^\circ \]
\[ \theta_h = \theta_a + \varphi = -26.565^\circ + 43.089^\circ = 16.524^\circ \]
\[ 2\theta_k = 2\theta_h + 360^\circ - 4\varphi = 32.524^\circ + 360^\circ - 172.355^\circ = 220.169^\circ \]
\[ \theta_k = 110.085^\circ \]

Permissible range of \( \theta \):
\[ \theta_h \leq \theta \leq \theta_k \]
\[ 16.524^\circ \leq \theta \leq 110.085^\circ \]

Also,
\[ 196.524^\circ \leq \theta \leq 290.085^\circ \]

\[ R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} \]
\[ = \sqrt{45^2 + 60^2} = 75 \text{ MPa} \]
\[ \tan 2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \frac{(2)(-60)}{90} = -\frac{4}{3} \]
\[ 2\theta_p = -53.13^\circ \]
\[ \theta_d = -26.565^\circ \]

\( \sigma_x' \leq 100 \text{ MPa} \) for states of stress corresponding to arc \( HBK \) of Mohr’s circle. From the circle,

\[ R \cos 2\varphi = 100 - 45 = 55 \text{ MPa} \]
\[ \cos 2\varphi = \frac{55}{75} = 0.73333 \]
\[ 2\varphi = 42.833^\circ \quad \varphi = 21.417^\circ \]
\[ \theta_h = \theta_d + \varphi = -26.565^\circ + 21.417^\circ = -5.15^\circ \]
\[ 2\theta_h + 360^\circ - 4\varphi = -10.297^\circ + 360^\circ - 85.666^\circ = 264.037^\circ \]
\[ \theta_h = 132.02^\circ \]

Permissible range of \( \theta \) is \( \theta_h \leq \theta \leq \theta_k \)

\[-5.15^\circ \leq \theta \leq 132.02^\circ \]

Also, \( 174.85^\circ \leq \theta \leq 312.02^\circ \)
PROBLEM 7.61

For the element shown, determine the range of values of $\tau_{xy}$ for which the maximum tensile stress is equal to or less than 60 MPa.

SOLUTION

\[ \sigma_x = -20 \text{ MPa} \quad \sigma_y = -120 \text{ MPa} \]
\[ \sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = -70 \text{ MPa} \]

Set
\[ \sigma_{max} = 60 \text{ MPa} = \sigma_{ave} + R \]
\[ R = \sigma_{max} - \sigma_{ave} = 130 \text{ MPa} \]

But
\[ R = \sqrt{\left(\frac{\sigma_x - \sigma_x}{2}\right)^2 + \tau_{xy}^2} \]
\[ |\tau_{xy}| = \sqrt{R^2 - \left(\frac{\sigma_x - \sigma_x}{2}\right)^2} \]
\[ = \sqrt{130^2 - 50^2} \]
\[ = 120 \text{ MPa} \]

Range of $\tau_{xy}$: $-120 \text{ MPa} \leq \tau_{xy} \leq 120 \text{ MPa}$
**PROBLEM 7.62**

For the element shown, determine the range of values of $\tau_{xy}$ for which the maximum in-plane shearing stress is equal to or less than 150 MPa.

**SOLUTION**

\[ \sigma_x = -20 \text{ MPa} \quad \sigma_y = -120 \text{ MPa} \]

\[ \frac{1}{2}(\sigma_x - \sigma_y) = 50 \text{ MPa} \]

Set \[ \tau_{\text{max (in-plane)}} = R = 150 \text{ MPa} \]

But

\[ R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} \]

\[ |\tau_{xy}| = \sqrt{R^2 - \left(\frac{\sigma_x - \sigma_y}{2}\right)^2} \]

\[ = \sqrt{150^2 - 50^2} \]

\[ = 141.4 \text{ MPa} \]

Range of $\tau_{xy}$:

\[ -141.4 \text{ MPa} \leq \tau_{xy} \leq 141.4 \text{ MPa} \]
**PROBLEM 7.63**

For the state of stress shown it is known that the normal and shearing stresses are directed as shown and that \( \sigma_x = 14 \text{ ksi}, \sigma_y = 9 \text{ ksi}, \) and \( \sigma_{\text{min}} = 5 \text{ ksi}. \) Determine (a) the orientation of the principal planes, (b) the principal stress \( \sigma_{\text{max}}, \) (c) the maximum in-plane shearing stress.

**SOLUTION**

\[
\begin{align*}
\sigma_x &= 14 \text{ ksi}, \quad \sigma_y = 9 \text{ ksi}, \quad \sigma_{\text{ave}} = \frac{1}{2}(\sigma_x + \sigma_y) = 11.5 \text{ ksi} \\
\sigma_{\text{min}} &= \sigma_{\text{ave}} - R \quad \therefore \quad R = \sigma_{\text{ave}} - \sigma_{\text{min}} \\
&= 11.5 - 5 = 6.5 \text{ ksi} \\
R &= \sqrt{x^2 + \tau_{xy}} \\
\tau_{xy} &= \pm \sqrt{R^2 - \left(\frac{\sigma_x - \sigma_y}{2}\right)^2} = \pm \sqrt{6.5^2 - 2.5^2} = \pm 6 \text{ ksi}

But it is given that \( \tau_{xy} \) is positive, thus \( \tau_{xy} = +6 \text{ ksi}. \)

(a) \( \tan 2\theta_p = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \frac{(2)(6)}{5} = 2.4 \)

\[2\theta_p = 67.38^\circ\]

(b) \( \sigma_{\text{max}} = \sigma_{\text{ave}} + R \)

\[\sigma_{\text{max}} = 18.00 \text{ ksi}\]

(c) \( \tau_{\text{max (in-plane)}} = R \)

(a) Prove that the expression \( \sigma_x' \sigma_y' - \tau_{x'y}'^2 \), where \( \sigma_x', \sigma_y', \) and \( \tau_{x'y}' \) are components of the stress along the rectangular axes \( x' \) and \( y' \), is independent of the orientation of these axes. Also, show that the given expression represents the square of the tangent drawn from the origin of the coordinates to Mohr’s circle.

(b) Using the invariance property established in part a, express the shearing stress \( \tau_{xy} \) in terms of \( \sigma_x, \sigma_y, \) and the principal stresses \( \sigma_{\text{max}} \) and \( \sigma_{\text{min}}. \)

SOLUTION

(a) From Mohr’s circle,
\[
\tau_{x'y}' = R \sin 2\theta_p \\
\sigma_x' = \sigma_{\text{ave}} + R \cos 2\theta_p \\
\sigma_y' = \sigma_{\text{ave}} - R \cos 2\theta_p \\
\sigma_x' \sigma_y' - \tau_{x'y}'^2 \\

\]

Draw line \( \overline{OK} \) from origin tangent to the circle at \( K \). Triangle \( OCK \) is a right triangle.
\[
\overline{OC}^2 = \overline{OK}^2 + \overline{CK}^2 \\
\overline{OK}^2 = \overline{OC}^2 - \overline{CK}^2 \\
= \sigma_{\text{ave}}^2 - R^2 \\

\]

(b) Applying above to \( \sigma_x, \sigma_y, \) and \( \tau_{xy} \), and to \( \sigma_a, \sigma_b, \)
\[
\sigma_x \sigma_y - \tau_{xy}^2 = \sigma_a \sigma_b - \tau_{ab}^2 = \sigma_{\text{ave}}^2 - R^2

PROBLEM 7.66

For the state of plane stress shown, determine the maximum shearing stress when

(a) \( \sigma_x = 6 \text{ ksi} \) and \( \sigma_y = 18 \text{ ksi} \),
(b) \( \sigma_x = 14 \text{ ksi} \) and \( \sigma_y = 2 \text{ ksi} \). (Hint: Consider both in-plane and out-of-plane shearing stresses.)

SOLUTION

(a) \( \sigma_x = 6 \text{ ksi}, \quad \sigma_y = 18 \text{ ksi}, \quad \tau_{xy} = 8 \text{ ksi} \)

\[
\sigma_{\text{ave}} = \frac{1}{2}(\sigma_x + \sigma_y) = 12 \text{ ksi}
\]

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}

\[

For the state of stress shown, determine the maximum shearing stress when (a) $\sigma_y = 40$ MPa, (b) $\sigma_y = 120$ MPa. (Hint: Consider both in-plane and out-of-plane shearing stresses.)

SOLUTION

(a) $\sigma_x = 140$ MPa, $\sigma_y = 40$ MPa, $\tau_{xy} = 80$ MPa

$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 90$ MPa

$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{50^2 + 80^2} = 94.34$ MPa

$\sigma_a = \sigma_{ave} + R = 184.34$ MPa (max)

$\sigma_b = \sigma_{ave} - R = -4.34$ MPa (min)

$\sigma_c = 0$

$\tau_{\text{max}} = \frac{1}{2}(\sigma_{\text{max}} - \sigma_{\text{min}}) = \frac{1}{2}(\sigma_a - \sigma_b) = 94.3$ MPa

(b) $\sigma_x = 140$ MPa, $\sigma_y = 120$ MPa, $\tau_{xy} = 80$ MPa

$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 130$ MPa

$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{10^2 + 80^2} = 80.62$ MPa

$\sigma_a = \sigma_{ave} + R = 210.62$ MPa (max)

$\sigma_b = \sigma_{ave} - R = 49.38$ MPa

$\sigma_c = 0$ (min)

$\sigma_{\text{max}} = \sigma_a = 210.62$ MPa $\sigma_{\text{min}} = \sigma_c = 0$

PROBLEM 7.75

For the state of stress shown, determine two values of $\sigma_y$ for which the maximum shearing stress is 73 MPa.

SOLUTION

$\sigma_x = -50$ MPa, $\tau_{xy} = 48$ MPa

Let $u = \frac{\sigma_y - \sigma_x}{2}$

$\sigma_y = 2u + \sigma_x$

$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = \sigma_x + u$

$R = \sqrt{u^2 + \tau_{xy}^2}$

$u = \pm \sqrt{R^2 - \tau_{xy}^2}$

Case (1)

$\tau_{max} = R = 73$ MPa, $u = \pm \sqrt{73^2 - 48^2} = \pm 55$ MPa

(1a) $u = +55$ MPa $\sigma_y = 2u + \sigma_x = 60$ MPa

$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 5$ MPa

$\sigma_a = \sigma_{ave} + R = 78$ MPa, $\sigma_b = \sigma_{ave} - R = -68$ MPa

$\sigma_a = 0$ $\sigma_{max} = 78$ MPa, $\sigma_{min} = -68$ MPa, $\tau_{max} = 73$ MPa

Case (2)

Assume $\sigma_{\text{max}} = 0$.  

$\tau_{\text{max}} = \frac{1}{2}(\sigma_{\text{max}} - \sigma_{\text{min}}) = 73 \text{ MPa}$

$\sigma_{\text{min}} = -146 \text{ MPa} = \sigma_b$

$\sigma_b = \sigma_{\text{ave}} - R = \sigma_x + u - \sqrt{u^2 + \tau_{xy}^2}$

$u^2 + \tau_{xy}^2 = (\sigma_x - \sigma_b)^2 + 2(\sigma_x - \sigma_b)u + u^2$

PROBLEM 7.76

For the state of plane stress shown, determine the value of \( \tau_{xy} \) for which the maximum shearing stress is (a) 10 ksi, (b) 8.25 ksi.

\sigma_x &= -15 \text{ ksi} \quad \sigma_y = -3 \text{ ksi} \quad \sigma_z = 0 \\
\sigma_{ave} &= \frac{1}{2} (\sigma_x + \sigma_y) = -9 \text{ ksi}

(a) \( \tau_{max} = 10 \text{ ksi} \):

If \( \tau_{max} \) is the in-plane maximum shearing stress, then

\[
R = \tau_{max} = 10 \text{ ksi}

\[
\begin{align*}
\sigma_{max} &= \sigma_{ave} + R = 1 \text{ ksi} \\
\sigma_{min} &= \sigma_{ave} - R = -19 \text{ ksi}

\]

\( \sigma_z \) is the intermediate principal stress; the assumption \( R = \tau_{max} \) is correct.

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{6^2 + \tau_{xy}^2} = 10

If \( \tau_{max} \) is the in-plane maximum shearing stress, then

\[
\begin{align*}

\sigma_{min} &= \sigma_{ave} - R = -9 - 8.25 = -17.25 \text{ ksi}

\( \sigma_z = 0 \) is not the intermediate principal stress.

Let \( \sigma_z = 0 = \sigma_{max} \).

\[
\begin{align*}
\sigma_{min} &= \sigma_{max} - 2\tau_{max} = 0 - (2)(8.25) = -16.5 \text{ ksi} \\
R &= \sigma_{ave} - \sigma_{min} = -9 - (-16.5) = 7.5 \text{ ksi}

PROBLEM 7.77

For the state of stress shown, determine the value of $\tau_{xy}$ for which the maximum shearing stress is (a) 60 MPa, (b) 78 MPa.

SOLUTION

\[
\sigma_x = 100 \text{ MPa}, \quad \sigma_y = 40 \text{ MPa}, \quad \sigma_z = 0
\]
\[
\sigma_{\text{ave}} = \frac{1}{2}(\sigma_x + \sigma_y) = 70 \text{ MPa}
\]

(a) $\tau_{\text{max}} = 60 \text{ MPa}$.

If $\sigma_z$ is $\sigma_{\text{min}}$, then $\sigma_{\text{max}} = \sigma_{\text{min}} + 2\tau_{\text{max}}$.

\[
\sigma_{\text{max}} = 0 + (2)(60) = 120 \text{ MPa}
\]
\[
\sigma_{\text{max}} = \sigma_{\text{ave}} + R
\]
\[
R = \sigma_{\text{max}} - \sigma_{\text{ave}} = 120 - 70 = 50 \text{ MPa}
\]
\[
\sigma_y = \sigma_{\text{max}} - 2R = 20 \text{ MPa} > 0
\]
\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{30^2 + \tau_{xy}^2} = 50 \text{ MPa}
\]
\[
\tau_{xy} = \sqrt{50^2 - 30^2} = 40 \text{ MPa}
\]

(b) $\tau_{\text{max}} = 78 \text{ MPa}$.

If $\sigma_z$ is $\sigma_{\text{min}}$, then $\sigma_{\text{max}} = \sigma_{\text{min}} + 2\tau_{\text{max}} = 0 + (2)(78) = 156 \text{ MPa}$.

\[
\sigma_{\text{max}} = \sigma_{\text{ave}} + R
\]
\[
R = \sigma_{\text{max}} - \sigma_{\text{ave}} = 156 - 70 = 86 \text{ MPa} > \tau_{\text{max}} = 78 \text{ MPa}
\]

Set

\[
R = \tau_{\text{max}} = 78 \text{ MPa}. \quad \sigma_{\text{min}} = \sigma_{\text{ave}} - R = -8 \text{ MPa} < 0
\]
\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{30^2 + \tau_{xy}^2}
\]
\[
\tau_{xy} = \sqrt{78^2 - 30^2} = 72 \text{ MPa}
\]
PROBLEM 7.78

For the state of stress shown, determine two values of \( \sigma_y \) for which the maximum shearing stress is 80 MPa.

SOLUTION

\( \sigma_x = 90 \text{ MPa}, \quad \sigma_z = 0, \quad \tau_{xz} = 60 \text{ MPa} \)

Mohr’s circle of stresses in \( zx \)-plane:

\[
\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_z) = 45 \text{ MPa}
\]

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_z}{2}\right)^2 + \tau_{xz}^2} = \sqrt{45^2 + 60^2} = 75 \text{ MPa}
\]

\[
\sigma_a = \sigma_{ave} + R = 120 \text{ MPa}, \quad \sigma_b = \sigma_{ave} - R = -30 \text{ MPa}
\]

Assume \( \sigma_{max} = \sigma_a = 120 \text{ MPa} \).

\[
\sigma_y = \sigma_{min} = \sigma_{max} - 2\tau_{max}
= 120 - (2)(80)
= -40 \text{ MPa} \quad \downarrow
\]

Assume \( \sigma_{min} = \sigma_b = -30 \text{ MPa} \).

\[
\sigma_y = \sigma_{max} = \sigma_{min} + 2\tau_{max}
= -30 + (2)(80)
= 130 \text{ MPa} \quad \downarrow
\]
PROBLEM 7.79

For the state of stress shown, determine the range of values of $\tau_{xz}$ for which the maximum shearing stress is equal to or less than 60 MPa.

SOLUTION

$\sigma_x = 60$ MPa, $\sigma_z = 0$, $\sigma_y = 100$ MPa

For Mohr’s circle of stresses in zx-plane

\[
\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_z) = 30 \text{ MPa}
\]

\[
u = \frac{\sigma_x - \sigma_z}{2} = 30 \text{ MPa}
\]

Assume $\sigma_{\text{max}} = \sigma_y = 100$ MPa

\[
\sigma_{\text{min}} = \sigma_b = \sigma_{\text{max}} - 2\tau_{\text{max}}
\]

\[
= 100 - (2)(60) = -20 \text{ MPa}
\]

\[
R = \sigma_{\text{ave}} - \sigma_b
\]

\[
= 30 - (-20) = 50 \text{ MPa}
\]

\[
\sigma_a = \sigma_{\text{ave}} + R
\]

\[
= 30 + 50 = 80 \text{ MPa} < \sigma_y
\]

\[
R = \sqrt{u^2 + \tau_{xz}^2}
\]

\[
\tau_{xz} = \pm \sqrt{R^2 - u^2}
\]

\[
= \pm \sqrt{50^2 - 30^2} = \pm 40 \text{ MPa}
\]

$-40 \text{ MPa} \leq \tau_{xz} \leq 40 \text{ MPa}$
PROBLEM 7.80*

For the state of stress of Prob. 7.69, determine (a) the value of $\sigma_y$ for which the maximum shearing stress is as small as possible, (b) the corresponding value of the shearing stress.

**SOLUTION**

Let

$$u = \frac{\sigma_x - \sigma_y}{2} \quad \sigma_y = \sigma_x - 2u$$

$$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = \sigma_x - u$$

$$R = \sqrt{u^2 + \tau_{xy}^2}$$

$$\sigma_a = \sigma_{ave} + R = \sigma_x - u + \sqrt{u^2 + \tau_{xy}^2}$$

$$\sigma_b = \sigma_{ave} - R = \sigma_x - u - \sqrt{u^2 + \tau_{xy}^2}$$

Assume $\tau_{max}$ is the in-plane shearing stress. $\tau_{max} = R$

Then $\tau_{max}$ (in-plane) is minimum if $u = 0$.

$$\sigma_y = \sigma_x - 2u = \sigma_x = 140 \text{ MPa}, \quad \sigma_{ave} = \sigma_x - u = 140 \text{ MPa}$$

$$R = \sqrt{\tau_{xy}^2} = 80 \text{ MPa}$$

$$\sigma_a = \sigma_{ave} + R = 140 + 80 = 220 \text{ MPa}$$

$$\sigma_b = \sigma_{ave} - R = 140 - 80 = 60 \text{ MPa}$$

$$\sigma_{max} = 220 \text{ MPa}, \quad \sigma_{min} = 0, \quad \tau_{max} = \frac{1}{2}(\sigma_{max} - \sigma_{min}) = 110 \text{ MPa}$$

Assumption is incorrect.

Assume

$$\sigma_{max} = \sigma_a = \sigma_{ave} + R = \sigma_x - u + \sqrt{u^2 + \tau_{xy}^2}$$

$$\sigma_{min} = 0 \quad \tau_{max} = \frac{1}{2}(\sigma_{max} - \sigma_{min}) = \frac{1}{2}\sigma_a$$

$$\frac{d\sigma_a}{du} = -1 + \frac{u}{\sqrt{u^2 + \tau_{xy}^2}} \neq 0 \quad \text{(no minimum)}$$
PROBLEM 7.80* (Continued)

Optimum value for \( u \) occurs when \( \tau_{\text{max (out-of-plane)}} = \tau_{\text{max (in-plane)}} \)

\[
\frac{1}{2}(\sigma_a + R) = R \quad \text{or} \quad \sigma_a = R \quad \text{or} \quad \sigma_a - u = \sqrt{u^2 + \tau_{xy}^2}
\]

\[
(\sigma_a - u)^2 = \sigma_x^2 - 2u \sigma_x + \mu^2 = \mu^2 + \tau_{xy}^2
\]

\[
2u = \frac{\sigma_x^2 - \tau_{xy}^2}{\sigma_x} = \frac{140^2 - 80^2}{140} = 94.3 \text{ MPa}
\]

\[ u = 47.14 \text{ MPa} \]

(a) \( \sigma_y = \sigma_x - 2u = 140 - 94.3 \quad \sigma_y = 45.7 \text{ MPa} \)

(b) \( R = \sqrt{u^2 + \tau_{xy}^2} = \tau_{\text{max}} = 92.9 \text{ MPa} \quad \tau_{\text{max}} = 92.9 \text{ MPa} \)

(a) $\sigma_0 = 200$ MPa \[ \sigma_{ave} = -200 \text{ MPa} \]

The 36-mm-diameter shaft is made of a grade of steel with a 250-MPa tensile yield stress. Using the maximum-shearing-stress criterion, determine the magnitude of the torque $T$ for which yield occurs when $P = 200$ kN.

SOLUTION

\[ P = 200 \text{ kN} = 200 \times 10^3 \text{ N} \quad c = \frac{1}{2} d = 18 \text{ mm} = 18 \times 10^{-3} \text{ m} \]
\[ A = \pi c^2 = \pi (18 \times 10^{-3})^2 = 1.01788 \times 10^{-3} \text{ m}^2 \]

The 1.75-in.-diameter shaft $AB$ is made of a grade of steel for which the yield strength is $\sigma_y = 36$ ksi. Using the maximum-shearing-stress criterion, determine the magnitude of the force $P$ for which yield occurs when $T = 15$ kip · in.

SOLUTION

Let the $x$-axis lie along the shaft axis.

$$\sigma_y = 0, \quad \sigma_z = 0$$

$$\sigma_x = \frac{P}{A}, \quad \tau_{xy} = \frac{Tc}{J}$$

Section properties:

$$c = \frac{1}{2} d = 0.875 \text{ in.}$$

$$A = \pi c^2 = \pi (0.875)^2 = 2.4053 \text{ in}^2, \quad J = \frac{\pi}{2} c^4 = \frac{\pi}{2} (0.875)^4 = 0.92077 \text{ in}^4$$

From torsion,

$$\tau_{xy} = \frac{Tc}{J} = \frac{(15)(0.875)}{0.92077} = 14.254 \text{ ksi}$$

From Mohr’s circle,

$$\sigma_{ave} = \frac{1}{2} (\sigma_x + \sigma_y) = \frac{1}{2} \sigma_x$$

$$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{\frac{\sigma_x^2}{4} + \tau_{xy}^2}$$

$$\sigma_a = \sigma_{ave} + R = \frac{1}{2} \sigma_x + \frac{\sigma_x^2}{2} + \tau_{xy}$$

$$\sigma_b = \sigma_{ave} - R = \frac{1}{2} \sigma_x - \frac{\sigma_x^2}{2} + \tau_{xy}$$

Maximum shearing stress criterion:

$$\sigma_{\text{max}} = \sigma_a, \quad \sigma_{\text{min}} = \sigma_b$$

$$2\tau_{\text{max}} = \sigma_{\text{max}} - \sigma_{\text{min}} = \sigma_a - \sigma_b = 2\sqrt{\frac{\sigma_x^2}{4} + \tau_{xy}^2} = \sigma_y$$

$$\sqrt{\sigma_x^2 + 4\tau_{xy}^2} = \sigma_y$$

$$\sigma_x = \sqrt{(36)^2 - 4(14.254)^2} = 21.984 \text{ ksi}$$

$$P = \sigma_x A = (21.984)(2.4053)$$

$$P = 52.9 \text{ kips}$$
PROBLEM 7.88

Solve Prob. 7.87, using the maximum-distortion-energy criterion.

PROBLEM 7.87 The 1.75-in.-diameter shaft $AB$ is made of a grade of steel for which the yield strength is $\sigma_y = 36$ ksi. Using the maximum-shearing-stress criterion, determine the magnitude of the force $P$ for which yield occurs when $T = 15$ kip-in.

SOLUTION

Let the $x$-axis lie along the shaft axis.

$\sigma_x = \frac{P}{A}, \quad \tau_{xy} = \frac{TC}{J}$

Section properties:

$e = \frac{1}{2}d = 0.875 \text{ in.}$

$A = \pi c^2 = \pi(0.875)^2 = 2.4053 \text{ in}^2, \quad J = \frac{\pi}{2} c^4 = \frac{\pi}{2}(0.875)^4 = 0.92077 \text{ in}^4$

From torsion,

$\tau_{xy} = \frac{Tc}{J} = \frac{(15)(0.875)}{0.92077} = 14.254 \text{ ksi}$

From Mohr’s circle,

$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = \frac{1}{2}\sigma_x$

$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{\frac{\sigma_x^2}{4} + \tau_{xy}^2}$

$\sigma_a = \sigma_{ave} + R$

$\sigma_b = \sigma_{ave} - R$

Distortion energy criterion:

$\sigma_a^2 + \frac{\sigma_b^2}{4} - \frac{\sigma_a \sigma_b}{4} = \sigma_y^2$

$(\sigma_{ave} + R)^2 + (\sigma_{ave} - R)^2 - (\sigma_{ave} + R)(\sigma_{ave} - R) = \sigma_y^2$

$\sigma_{ave}^2 + 3R^2 = \sigma_y^2$

$\left(\frac{\sigma_x}{2}\right)^2 + 3\left[\frac{\sigma_x^2}{4} + \tau_{xy}^2\right] = \sigma_x^2 + 3\tau_{xy}^2 = \sigma_y^2$

$\sigma_x = \sqrt{\sigma_y^2 - 3\tau_{xy}^2}$

$\sigma_x = \sqrt{(36)^2 - (3)(14.254)^2}$

$= 26.200 \text{ ksi}$

$P = \sigma_x A = (26.200)(2.4053)\quad P = 63.0 \text{ kips}$
PROBLEM 7.89

The state of plane stress shown is expected to occur in an aluminum casting. Knowing that for the aluminum alloy used $\sigma_{UT} = 80 \text{ MPa}$ and $\sigma_{UC} = 200 \text{ MPa}$ and using Mohr’s criterion, determine whether rupture of the casting will occur.

SOLUTION

\[
\begin{align*}
\sigma_x &= 10 \text{ MPa}, \\
\sigma_y &= -100 \text{ MPa}, \\
\tau_{xy} &= 60 \text{ MPa} \\
\sigma_{ave} &= \frac{\sigma_x + \sigma_y}{2} = \frac{10 - 100}{2} = -45 \text{ MPa} \\
R &= \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{(55)^2 + (60)^2} = 81.39 \text{ MPa} \\
\sigma_a &= \sigma_{ave} + R = -45 + 81.39 = 36.39 \text{ MPa} \\
\sigma_b &= \sigma_{ave} - R = -45 - 81.39 = -126.39 \text{ MPa}
\end{align*}
\]

Equation of 4th quadrant of boundary:

\[
\frac{\sigma_a}{\sigma_{UT}} - \frac{\sigma_b}{\sigma_{UC}} = 1
\]

\[
\frac{36.39}{80} - \frac{-126.39}{200} = 1.087 > 1
\]

Rupture will occur.
**PROBLEM 7.90**

The state of plane stress shown is expected to occur in an aluminum casting. Knowing that for the aluminum alloy used $\sigma_{UT} = 80$ MPa and $\sigma_{UC} = 200$ MPa and using Mohr’s criterion, determine whether rupture of the casting will occur.

**SOLUTION**

\[
\begin{align*}
\sigma_s &= -32 \text{ MPa}, \\
\sigma_y &= 0, \\
\tau_{xy} &= 75 \text{ MPa} \\
\sigma_{ave} &= \frac{1}{2}(\sigma_s + \sigma_y) = -16 \text{ MPa} \\
R &= \sqrt{\left(\frac{\sigma_s - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{(16)^2 + (75)^2} = 76.69 \text{ MPa} \\
\sigma_a &= \sigma_{ave} + R = -16 + 76.69 = 60.69 \text{ MPa} \\
\sigma_b &= \sigma_{ave} - R = -16 - 76.69 = -92.69 \text{ MPa}
\end{align*}
\]

Equation of 4th quadrant of boundary:

\[
\frac{\sigma_a}{\sigma_{UT}} - \frac{\sigma_b}{\sigma_{UC}} = 1 \\
\frac{60.69}{80} - \frac{(-92.69)}{200} = 1.222 > 1
\]

Rupture will occur.
PROBLEM 7.91

The state of plane stress shown is expected to occur in an aluminum casting. Knowing that for the aluminum alloy used $\sigma_{UT} = 10 \text{ ksi}$ and $\sigma_{UC} = 30 \text{ ksi}$ and using Mohr’s criterion, determine whether rupture of the casting will occur.

SOLUTION

$\sigma_x = -8 \text{ ksi}$,
$\sigma_y = 0$,
$\tau_{xy} = 7 \text{ ksi}$

$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = -4 \text{ ksi}$

$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{4^2 + 7^2} = 8.062 \text{ ksi}$

$\sigma_a = \sigma_{ave} + R = -4 + 8.062 = 4.062 \text{ ksi}$

$\sigma_b = \sigma_{ave} - R = -4 - 8.062 = -12.062 \text{ ksi}$

Equation of 4th quadrant of boundary:

$$\frac{\sigma_a}{\sigma_{UT}} - \frac{\sigma_b}{\sigma_{UC}} = 1$$

$$\frac{4.062}{10} - \frac{-12.062}{30} = 0.808 < 1$$

No rupture.
**PROBLEM 7.92**

**SOLUTION**

\[
\begin{align*}
\sigma_x &= 2 \text{ ksi}, \\
\sigma_y &= -15 \text{ ksi}, \\
\tau_{xy} &= 9 \text{ ksi} \\
\sigma_{ave} &= \frac{1}{2}(\sigma_x + \sigma_y) = -6.5 \text{ ksi} \\
R &= \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{8.5^2 + 9^2} = 12.379 \text{ ksi} \\
\sigma_a &= \sigma_{ave} + R = 5.879 \text{ ksi} \\
\sigma_b &= \sigma_{ave} - R = -18.879 \text{ ksi}
\end{align*}
\]

Equation of 4th quadrant of boundary:

\[
\frac{\sigma_a}{\sigma_{UT}} - \frac{\sigma_b}{\sigma_{UC}} = 1 \\
\frac{5.879}{10} - \frac{(-18.879)}{30} = 1.217 > 1
\]

Rupture will occur.
PROBLEM 7.93

The state of plane stress shown will occur at a critical point in an aluminum casting that is made of an alloy for which $\sigma_{UT} = 10$ ksi and $\sigma_{UC} = 25$ ksi. Using Mohr’s criterion, determine the shearing stress $\tau_0$ for which failure should be expected.

SOLUTION

\[
\begin{align*}
\sigma_x &= 8 \text{ ksi}, \\
\sigma_y &= 0, \\
\tau_{xy} &= \tau_0 \\
\sigma_{ave} &= \frac{1}{2}(\sigma_x + \sigma_y) = 4 \text{ ksi} \\
R &= \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{4^2 + \tau_0^2} \\
\tau_0 &= \pm \sqrt{R^2 - 4^2} \\
\sigma_a &= \sigma_{ave} + R = (4 + R) \text{ ksi} \\
\sigma_b &= \sigma_{ave} - R = (4 - R) \text{ ksi} \\
\end{align*}
\]

Since $|\sigma_{ave}| < R$, stress point lies in 4th quadrant. Equation of 4th quadrant boundary is

\[
\frac{\sigma_a - \sigma_b}{\sigma_{UT} - \sigma_{UC}} = 1 \\
\frac{4 + R}{10} - \frac{4 - R}{25} = 1 \\
\left(\frac{1}{10} + \frac{1}{25}\right)R = 1 - \frac{4}{10} + \frac{4}{25} \\
R = 5.429 \text{ ksi} \\
\tau_0 = \pm \sqrt{5.429^2 - 4^2} \\
\tau_0 = \pm 3.67 \text{ ksi}
\]
PROBLEM 7.94

The state of plane stress shown will occur at a critical point in a pipe made of an aluminum alloy for which $\sigma_{UT} = 75\, \text{MPa}$ and $\sigma_{UC} = 150\, \text{MPa}$. Using Mohr’s criterion, determine the shearing stress $\tau_0$ for which failure should be expected.

SOLUTION

$\sigma_x = -80\, \text{MPa},$

$\sigma_y = 0,$

$\tau_{xy} = -\tau_0$

$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = -40\, \text{MPa}$

$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{40^2 + \tau_0^2} \, \text{MPa}$

$\sigma_a = \sigma_{ave} + R$

$\sigma_b = \sigma_{ave} - R$

$\tau_0 = \pm \sqrt{R^2 - 40^2}$

Since $|\sigma_{ave}| < R$, stress point lies in 4th quadrant. Equation of 4th quadrant boundary is

$$\frac{\sigma_a - \sigma_b}{\sigma_{UT} - \sigma_{UC}} = 1$$

$$\frac{-40 + R}{75} - \frac{-40 - R}{150} = 1$$

$$\frac{R}{75} + \frac{R}{150} = 1 + \frac{40}{75} - \frac{40}{150} = 1.2667$$

$$R = 63.33\, \text{MPa}, \quad \tau_0 = \pm \sqrt{63.33^2 - 40^2} \quad \tau_0 = \pm 8.49\, \text{MPa} \, \blacktriangle$$
PROBLEM 7.95

The cast-aluminum rod shown is made of an alloy for which \( \sigma_{UT} = 60 \text{ MPa} \) and \( \sigma_{UC} = 120 \text{ MPa} \). Using Mohr’s criterion, determine the magnitude of the torque \( T \) for which failure should be expected.

SOLUTION

\[
P = 26 \times 10^3 \text{ N} \quad A = \frac{\pi}{4}(32)^2 = 804.25 \text{ mm}^2 = 804.25 \times 10^{-6} \text{ m}^2
\]

\[
\sigma_x = \frac{P}{A} = \frac{26 \times 10^3}{804.25 \times 10^{-6}} = 32.328 \times 10^6 \text{ Pa} = 32.328 \text{ MPa}
\]

\[
\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = \frac{1}{2}(32.328 + 0) = 16.164 \text{ MPa}
\]

\[
\frac{\sigma_x - \sigma_y}{2} = \frac{1}{2}(32.328 - 0) = 16.164 \text{ MPa}
\]

\[
\sigma_a = \sigma_{ave} + R = 16.164 + R \text{ MPa}
\]

\[
\sigma_b = \sigma_{ave} - R = 16.164 - R \text{ MPa}
\]

Since \( |\sigma_{ave}| < R \), stress point lies in the 4th quadrant. Equation of the 4th quadrant is

\[
\frac{\sigma_a}{\sigma_{UT}} - \frac{\sigma_b}{\sigma_{UC}} = 1 \quad \frac{16.164 + R}{60} - \frac{16.164 - R}{120} = 1
\]

\[
\left(\frac{1}{60} + \frac{1}{120}\right)R = 1 - \frac{16.164}{60} + \frac{16.164}{120}
\]

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} \quad \tau_{xy} = \sqrt{R^2 - \left(\frac{\sigma_x - \sigma_y}{2}\right)^2} = \sqrt{34.612^2 - 16.164^2} = 30.606 \text{ MPa}
\]

\[
= 30.606 \times 10^6 \text{ Pa}

\]

\[
T = \frac{\pi}{2}c^3 \tau_{xy} = \frac{\pi}{2}(16 \times 10^{-3})^3(30.606 \times 10^6) = 196.9 \text{ N} \cdot \text{m}

Since \( |\sigma_{ave}| < R \), stress point lies in 4th quadrant. Equation of boundary of 4th quadrant is

\[
\frac{\sigma_a - \sigma_b}{\sigma_{UT} - \sigma_{UC}} = 1 \\
\frac{R - -R}{70 - 175} = 1 \\
\left(\frac{1}{70} + \frac{1}{175}\right)R = 1 \\

SOLUTION

\[ r = \frac{d}{2} - t = \frac{3.3}{2} - 18 \times 10^{-3} = 1.632 \text{ m}, \quad t = 18 \times 10^{-3} \text{ m} \]

Determine the maximum height $h$ to which it can be filled with water if a factor of safety of 4.0 is desired. (Specific weight of water $= 62.4 \text{ lb/ft}^3$.)

SOLUTION

$$d_0 = (25)(12) = 300 \text{ in.}$$

$$r = \frac{1}{2}d - t = 150 - \frac{3}{16} = 149.81 \text{ in.}$$

PROBLEM 7.123

In Prob. 7.122, determine the maximum normal stress and the maximum shearing stress at point \( L \).

PROBLEM 7.122 The compressed-air tank \( AB \) has a 250-mm outside diameter and an 8-mm wall thickness. It is fitted with a collar by which a 40-kN force \( P \) is applied at \( B \) in the horizontal direction. Knowing that the gage pressure inside the tank is 5 MPa, determine the maximum normal stress and the maximum shearing stress at point \( K \).

SOLUTION

Consider element at point \( L \).

Stresses due to internal pressure:

\[
p = 5 \text{ MPa} = 5 \times 10^6 \text{ Pa}
\]

\[
r = \frac{1}{2} d - t = \frac{250}{2} - 8 = 117 \text{ mm}
\]

\[
\sigma_x = \frac{pr}{t} = \frac{(5 \times 10^6)(117 \times 10^{-3})}{8 \times 10^{-3}} = 73.125 \text{ MPa}
\]

\[
\sigma_y = \frac{pr}{2t} = \frac{(5 \times 10^6)(117 \times 10^{-3})}{2(8 \times 10^{-3})} = 36.563 \text{ MPa}
\]

Stress due to bending moment:

\[
M = (40 \text{ kN})(600 \text{ mm}) = 24000 \text{ N} \cdot \text{m}
\]

\[
c_1 = \frac{1}{2} d = 125 \text{ mm}
\]

\[
c_1 = c_2 - t = 125 - 8 = 117 \text{ mm}
\]

\[
I = \frac{\pi}{4} (c_2^4 - c_1^4) = \frac{\pi}{4} (125^4 - 117^4)
\]

\[
= 44.573 \times 10^6 \text{ mm}^4 = 44.573 \times 10^{-6} \text{ m}^4
\]

\[
\sigma_y = -\frac{Mc}{I} = -\frac{(24000)(125 \times 10^{-3})}{44.573 \times 10^{-6}} = -67.305 \text{ MPa}

A pressure vessel of 10-in. inner diameter and 0.25-in. wall thickness is fabricated from a 4-ft section of spirally-welded pipe $AB$ and is equipped with two rigid end plates. The gage pressure inside the vessel is 300 psi and 10-kip centric axial forces $P$ and $P'$ are applied to the end plates. Determine $(a)$ the normal stress perpendicular to the weld, $(b)$ the shearing stress parallel to the weld.

SOLUTION

\[
r = \frac{1}{2} d = \frac{1}{2} (10) = 5 \text{ in.} \quad t = 0.25 \text{ in.}
\]

\[
\sigma_1 = \frac{P r}{t} = \frac{(300)(5)}{0.25} = 6000 \text{ psi} = 6 \text{ ksi}

\[
\sigma_2 = \frac{P r}{2t} = \frac{(300)(5)}{2(0.25)} = 3000 \text{ psi} = 3 \text{ ksi}
\]

\[
r_0 = r + t = 5 + 0.25 = 5.25 \text{ in.}

\[
A = \pi \left( r_0^2 - r^2 \right) = \pi (5.25^2 - 5.00^2) = 8.0503 \text{ in}^2

The gage pressure inside the vessel is 300 psi and 10-kip centric axial forces \( P \) and \( P' \) are applied to the end plates. Determine (a) the normal stress perpendicular to the weld, (b) the shearing stress parallel to the weld.

SOLUTION

\[
\begin{align*}
\sigma_1 &= \frac{P_t}{t} = \frac{(300)(5)}{0.25} = 6000 \text{ psi} = 6 \text{ ksi} \\
\sigma_2 &= \frac{P_t}{2t} = \frac{(300)(5)}{2(0.25)} = 3000 \text{ psi} = 3 \text{ ksi} \\

Change in length of circumference:
\[ \Delta L_s = 2\pi r \varepsilon_s = 2\pi r \left( \frac{pr}{E_s t_s} + \alpha_s \Delta T \right) \]

Brass ring. External pressure $p$: \[ \sigma_b = -\frac{pr}{tb} \]

\]
\[
\epsilon_3 = +210 \times 10^{-6} \text{ in./in.}
\]

Determine (a) the orientation and magnitude of the principal strains in the plane of the rosette, (b) the maximum in-plane shearing strain.

SOLUTION

Use \( \epsilon_x = \epsilon_{x'} + \frac{1}{2} (\epsilon_x - \epsilon_y) \cos 2\theta + \frac{\gamma_{xy}}{2} \sin 2\theta \)

where
\[
\theta = -75^\circ \quad \text{for gage 1},
\]
\[
\theta = 0 \quad \text{for gage 2},
\]
and
\[
\theta = +75^\circ \quad \text{for gage 3}.
\]

\[
\epsilon_1 = \frac{1}{2} (\epsilon_x + \epsilon_y) + \frac{1}{2} (\epsilon_x - \epsilon_y) \cos (-150^\circ) + \frac{\gamma_{xy}}{2} \sin (-150^\circ) \quad (1)
\]
\[
\epsilon_2 = \frac{1}{2} (\epsilon_x + \epsilon_y) + \frac{1}{2} (\epsilon_x - \epsilon_y) \cos 0 + \frac{\gamma_{xy}}{2} \sin 0 \quad (2)
\]
\[
\epsilon_3 = \frac{1}{2} (\epsilon_x + \epsilon_y) + \frac{1}{2} (\epsilon_x - \epsilon_y) \cos (150^\circ) + \frac{\gamma_{xy}}{2} \sin (150^\circ) \quad (3)
\]

From Eq. (2), \( \epsilon_x = \epsilon_z = 385 \times 10^{-6} \text{ in/in} \)

Adding Eqs. (1) and (3),
\[
\epsilon_1 + \epsilon_3 = (\epsilon_x + \epsilon_y) + (\epsilon_x - \epsilon_y) \cos 150^\circ
\]
\[
= \epsilon_x (1 + \cos 150^\circ) + \epsilon_y (1 - \cos 150^\circ)
\]
\[
\epsilon_y = \frac{\epsilon_1 + \epsilon_3 - \epsilon_x (1 + \cos 150^\circ)}{(1 - \cos 150^\circ)}
\]
\[
= \frac{-93.1 \times 10^{-6} + 210 \times 10^{-6} - 385 \times 10^{-6} (1 + \cos 150^\circ)}{1 - \cos 150^\circ}
\]
\[
= 35.0 \times 10^{-6} \text{ in/in}
\]
PROBLEM 7.147 (Continued)

Subtracting Eq. (1) from Eq. (3),
\[ \varepsilon_3 - \varepsilon_1 = \gamma_{xy} \sin 150^\circ \]
\[ \gamma_{xy} = \frac{\varepsilon_3 - \varepsilon_1}{\sin 150^\circ} = \frac{210 \times 10^{-6} - (-93.1 \times 10^{-6})}{\sin 150^\circ} = 606.2 \times 10^{-6} \text{ in/in} \]

\[ \tan 2\theta_p = \frac{\gamma_{xy}}{\varepsilon_x - \varepsilon_y} = \frac{606.2 \times 10^{-6}}{385 \times 10^{-6} - 35.0 \times 10^{-6}} = 1.732 \quad (a) \quad \theta_a = 30.0^\circ, \quad \theta_b = 120.0^\circ \]

\[ \varepsilon_{ave} = \frac{1}{2}(\varepsilon_x + \varepsilon_y) = \frac{1}{2}(385 \times 10^{-6} + 35.0 \times 10^{-6}) = 210 \times 10^{-6} \text{ in/in} \]

\[ R = \sqrt{\left(\frac{\varepsilon_x - \varepsilon_y}{2}\right)^2 + \left(\frac{\gamma_{xy}}{2}\right)^2} = \sqrt{\left(\frac{385 \times 10^{-6} - 35.0 \times 10^{-6}}{2}\right)^2 + \left(\frac{606.2}{2}\right)^2} = 350.0 \times 10^{-6} \]

\[ \varepsilon_a = \varepsilon_{ave} + R = 210 \times 10^{-6} + 350.0 \times 10^{-6} = 560 \times 10^{-6} \text{ in/in} \]

\[ \varepsilon_b = \varepsilon_{ave} - R = 210 \times 10^{-6} - 350.0 \times 10^{-6} = -140.0 \times 10^{-6} \text{ in/in} \]

(b) \[ \frac{\gamma_{\text{max (in-plane)}}}{2} = R = 350.0 \times 10^{-6} \text{ in/in} \]

\[ \gamma_{\text{max (in-plane)}} = 700 \times 10^{-6} \text{ in/in} \]
PROBLEM 7.148

Using a 45° rosette, the strains \( \varepsilon_1, \varepsilon_2, \) and \( \varepsilon_3 \) have been determined at a given point. Using Mohr's circle, show that the principal strains are:

\[
\varepsilon_{\text{max,min}} = \frac{1}{2}(\varepsilon_1 + \varepsilon_3) \pm \frac{1}{\sqrt{2}}[\left(\varepsilon_1 - \varepsilon_2\right)^2 + \left(\varepsilon_2 - \varepsilon_3\right)^2]^{1/2}
\]

(Hint: The shaded triangles are congruent.)

SOLUTION

Since gage directions 1 and 3 are 90° apart,

\[
\varepsilon_{\text{ave}} = \frac{1}{2}(\varepsilon_1 + \varepsilon_3)
\]

Let

\[
u = \varepsilon_1 - \varepsilon_{\text{ave}} = \frac{1}{2}(\varepsilon_1 - \varepsilon_3).
\]

\[
v = \varepsilon_2 - \varepsilon_{\text{ave}} = \varepsilon_2 - \frac{1}{2}(\varepsilon_1 + \varepsilon_3)
\]

\[
R^2 = u^2 + v^2
\]

\[
= \frac{1}{4}(\varepsilon_1 - \varepsilon_3)^2 + \frac{1}{4}(\varepsilon_1 + \varepsilon_3)^2 - \frac{1}{2}\varepsilon_2\varepsilon_3 + \frac{1}{4}\varepsilon_3^2 - \varepsilon_2\varepsilon_1 - \varepsilon_2\varepsilon_3 + \frac{1}{4}\varepsilon_1^2 + \frac{1}{2}\varepsilon_1\varepsilon_3 + \frac{1}{4}\varepsilon_3^2
\]

\[
= \frac{1}{2}\varepsilon_2^2 - \frac{1}{2}\varepsilon_2\varepsilon_1 + \frac{1}{2}\varepsilon_2\varepsilon_3 + \frac{1}{2}\varepsilon_3^2
\]

\[
= \frac{1}{2}(\varepsilon_1 - \varepsilon_2)^2 + \frac{1}{2}(\varepsilon_2 - \varepsilon_3)^2
\]

\[
R = \frac{1}{\sqrt{2}}[(\varepsilon_1 - \varepsilon_2)^2 + (\varepsilon_2 - \varepsilon_3)^2]^{1/2}
\]

\[
\varepsilon_{\text{max, min}} = \varepsilon_{\text{ave}} \pm R
\]

gives the required formula.
PROBLEM 7.149

Show that the sum of the three strain measurements made with a 60° rosette is independent of the orientation of the rosette and equal to

\[ \epsilon_1 + \epsilon_2 + \epsilon_3 = 3\epsilon_{\text{avg}} \]

where \( \epsilon_{\text{avg}} \) is the abscissa of the center of the corresponding Mohr’s circle.

SOLUTION

\[ \epsilon_1 = \epsilon_{\text{ave}} + \frac{\epsilon_x - \epsilon_y}{2} \cos 2\theta + \frac{\gamma_{xy}}{2} \sin 2\theta \quad (1) \]

\[ \epsilon_2 = \epsilon_{\text{ave}} + \frac{\epsilon_x - \epsilon_y}{2} \cos (2\theta + 120^\circ) + \frac{\gamma_{xy}}{2} \sin (2\theta + 120^\circ) \]

\[ = \epsilon_{\text{ave}} + \frac{\epsilon_x - \epsilon_y}{2} (\cos 120^\circ \cos 2\theta - \sin 120^\circ \sin 2\theta) \]

\[ + \frac{\gamma_{xy}}{2} (\cos 120^\circ \sin 2\theta + \sin 120^\circ \cos 2\theta) \]

\[ = \epsilon_{\text{ave}} + \frac{\epsilon_x - \epsilon_y}{2} \left( -\frac{1}{2} \cos 2\theta - \frac{\sqrt{3}}{2} \sin 2\theta \right) \]

\[ + \frac{\gamma_{xy}}{2} \left( -\frac{1}{2} \sin 2\theta + \frac{\sqrt{3}}{2} \cos 2\theta \right) \quad (2) \]

\[ \epsilon_3 = \epsilon_{\text{ave}} + \frac{\epsilon_x - \epsilon_y}{2} \cos (2\theta + 240^\circ) + \frac{\gamma_{xy}}{2} \sin (2\theta + 240^\circ) \]

\[ = \epsilon_{\text{ave}} + \frac{\epsilon_x - \epsilon_y}{2} (\cos 240^\circ \cos 2\theta - \sin 240^\circ \sin 2\theta) \]

\[ + \frac{\gamma_{xy}}{2} (\cos 240^\circ \sin 2\theta + \sin 240^\circ \cos 2\theta) \]

\[ = \epsilon_{\text{ave}} + \frac{\epsilon_x - \epsilon_y}{2} \left( -\frac{1}{2} \cos 2\theta + \frac{\sqrt{3}}{2} \sin 2\theta \right) \]

\[ + \frac{\gamma_{xy}}{2} \left( -\frac{1}{2} \sin 2\theta - \frac{\sqrt{3}}{2} \cos 2\theta \right) \quad (3) \]

Adding (1), (2), and (3),

\[ \epsilon_1 + \epsilon_2 + \epsilon_3 = 3\epsilon_{\text{ave}} + 0 + 0 \]

\[ 3\epsilon_{\text{ave}} = \epsilon_1 + \epsilon_2 + \epsilon_3 \]

(2.43) and Eq. (2.38)] and then using Mohr’s circle for strain, \((b)\) by using Mohr’s circle for stress to determine the principal planes and principal stresses and then determining the corresponding strains.

SOLUTION

\((a)\) \(\sigma_x = 0, \ \sigma_y = -150 \times 10^6 \text{Pa}, \ \tau_{xy} = -75 \times 10^6 \text{Pa}\)

\[
R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = 20.54 \text{ MPa}
\]

\[
\sigma_a = \sigma_{ave} + R

\[

PROBLEM 7.158

Two wooden members of $80 \times 120$-mm uniform rectangular cross section are joined by the simple glued scarf splice shown. Knowing that $\beta = 22^\circ$ and that the maximum allowable stresses in the joint are, respectively, 400 kPa in tension (perpendicular to the splice and 600 kPa in shear (parallel to the splice), determine the largest centric load $P$ that can be applied.

SOLUTION

Forces

Areas

$$A = (80)(120) = 9.6 \times 10^3 \text{mm}^2 = 9.6 \times 10^{-3} \text{m}^2$$

$$N_{all} = \sigma_{all} \frac{A}{\sin \beta} = \frac{(400 \times 10^3)(9.6 \times 10^{-3})}{\sin 22^\circ} = 10.251 \times 10^3 \text{N}$$

$$\sum F_y = 0: \quad N - P \sin \beta = 0 \quad P = \frac{N}{\sin \beta} = \frac{10.251 \times 10^3}{\sin 22^\circ} = 27.4 \times 10^3 \text{N}$$

$$S_{all} = \tau_{all} \frac{A}{\sin \beta} = \frac{(600 \times 10^3)(9.6 \times 10^{-3})}{\sin 22^\circ} = 15.376 \times 10^3 \text{N}$$

$$\sum F_x = 0: \quad S - P \cos \beta = 0 \quad P = \frac{S}{\cos \beta} = \frac{15.376 \times 10^3}{\cos 22^\circ} = 16.58 \times 10^3 \text{N}$$

The smaller value for $P$ governs. $P = 16.58 \text{kN}$
PROBLEM 7.159

Two wooden members of 80 × 120-mm uniform rectangular cross section are joined by the simple glued scarf splice shown. Knowing that β = 25° and that centric loads of magnitude \( P = 10 \text{ kN} \) are applied to the members as shown, determine (a) the in-plane shearing stress parallel to the splice, (b) the normal stress perpendicular to the splice.

SOLUTION

\[ A = (80)(120) = 9.6 \times 10^3 \text{mm}^2 = 9.6 \times 10^{-3} \text{m}^2 \]

(a) \( \Sigma F_y = 0: \quad N - P \sin \beta = 0 \quad \Rightarrow \quad N = P \sin \beta = (10 \times 10^3) \sin 25^\circ = 4.226 \times 10^3 \text{N} \)

\[ \sigma = \frac{N}{A \sin \beta} = \frac{4.226 \times 10^3 \sin 25^\circ}{9.6 \times 10^{-3}} = 186.0 \times 10^3 \text{Pa} \]

\( \sigma = 186.0 \text{ kPa} \)

(b) \( \Sigma F_x = 0: \quad S - P \cos \beta = 0 \quad \Rightarrow \quad S = P \cos \beta = (10 \times 10^3) \cos 25^\circ = 9.063 \times 10^3 \text{N} \)

\[ \tau = \frac{N}{A \sin \beta} = \frac{9.063 \times 10^3 \sin 25^\circ}{9.6 \times 10^{-3}} = 399 \times 10^3 \text{Pa} \]

\( \tau = 399 \text{ kPa} \)
PROBLEM 7.160

The centric force $P$ is applied to a short post as shown. Knowing that the stresses on plane $a-a$ are $\sigma = -15$ ksi and $\tau = 5$ ksi, determine (a) the angle $\beta$ that plane $a-a$ forms with the horizontal, (b) the maximum compressive stress in the post.

SOLUTION

\[ \sigma_x = 0 \]
\[ \tau_{xy} = 0 \]
\[ \sigma_y = -P/A \]

(a) From the Mohr’s circle,

\[ \tan \beta = \frac{5}{15} = 0.3333 \]
\[ \beta = 18.4^\circ \]

\[ -\sigma = \frac{P}{2A} + \frac{P}{2A} \cos 2\beta \]

(b) \[ \frac{P}{A} = \frac{2(-\sigma)}{1 + \cos 2\beta} = \frac{(2)(15)}{1 + \cos 2\beta} \]
\[ \frac{P}{A} = 16.67 \text{ ksi} \]

SOLUTION

(a) \( \tau_{yz} = 17.5 \) ksi \( \sigma_x = -3 \) ksi

\[
R = \sqrt{(6)^2 + (17.5)^2} = 18.5

\[
\sigma_{\text{max}} = \sigma_A = 24.5 \text{ ksi}\]

\[
\sigma_{\text{min}} = \sigma_B = -12.5 \text{ ksi}\]

\[
\tau_{\text{max}} = \frac{1}{2} (\sigma_{\text{max}} - \sigma_{\text{min}}) = 18.5 \text{ ksi}\]

SOLUTION

For stresses in $xy$-plane, $\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 19$ ksi, $\frac{\sigma_x - \sigma_y}{2} = 5$ ksi

PROBLEM 7.165

A torque of magnitude $T = 12 \text{kN} \cdot \text{m}$ is applied to the end of a tank containing compressed air under a pressure of 8 MPa. Knowing that the tank has a 180-mm inner diameter and a 12-mm wall thickness, determine the maximum normal stress and the maximum shearing stress in the tank.

SOLUTION

$$d = 180 \text{ mm} \quad r = \frac{1}{2}d = 90 \text{ mm} \quad t = 12 \text{ mm}$$

Torsion:

$$c_1 = 90 \text{ mm} \quad c_2 = 90 + 12 = 102 \text{ mm}$$

$$J = \frac{\pi}{2} (c_2^4 - c_1^4) = 66.968 \times 10^6 \text{mm}^4 = 66.968 \times 10^{-6} \text{m}^4$$

$$\tau = \frac{Tc}{J} = \frac{(12 \times 10^3)(102 \times 10^{-3})}{66.968 \times 10^{-6}} = 18.277 \text{ MPa}$$

Pressure:

$$\sigma_i = \frac{pr}{t} = \frac{(8)(90)}{12} = 60 \text{ MPa} \quad \sigma_2 = \frac{pr}{2t} = 30 \text{ MPa}$$

Summary of stresses:

$$\sigma_x = 60 \text{ MPa}, \quad \sigma_y = 30 \text{ MPa}, \quad \tau_{xy} = 18.277 \text{ MPa}$$

$$\sigma_{ave} = \frac{1}{2}(\sigma_x + \sigma_y) = 45 \text{ MPa}$$

$$R = \sqrt{\frac{(\sigma_x - \sigma_y)^2}{2}} + \tau_{xy}^2 = 23.64 \text{ MPa}$$

$$\sigma_a = \sigma_{ave} + R = 68.64 \text{ MPa}$$

$$\sigma_b = \sigma_{ave} - R = 21.36 \text{ MPa}$$

$$\sigma_c = 0$$

$$\sigma_{max} = 68.6 \text{ MPa}$$

$$\sigma_{min} = 0$$

$$\tau_{max} = \frac{1}{2}(\sigma_{max} - \sigma_{min}) \quad \tau_{max} = 34.3 \text{ MPa}$$
PROBLEM 7.166

The tank shown has a 180-mm inner diameter and a 12-mm wall thickness. Knowing that the tank contains compressed air under a pressure of 8 MPa, determine the magnitude $T$ of the applied torque for which the maximum normal stress is 75 MPa.

SOLUTION

$$r = \frac{1}{2}d = \left(\frac{1}{2}\right)(180) = 90 \text{ mm} \quad t = 12 \text{ mm}$$

$$\sigma_1 = \frac{pr}{t} = \frac{(8)(90)}{12} = 60 \text{ MPa}$$

$$\sigma_2 = \frac{pr}{2t} = 30 \text{ MPa}$$

$$\sigma_{ave} = \frac{1}{2}(\sigma_1 + \sigma_2) = 45 \text{ MPa}$$

$$\sigma_{max} = 75 \text{ MPa}$$

$$R = \sigma_{max} - \sigma_{ave} = 30 \text{ MPa}$$

$$R = \sqrt{\left(\frac{\sigma_1 - \sigma_2}{2}\right)^2 + \tau_{xy}^2} = \sqrt{15^2 + \tau_{xy}^2}$$

$$\tau_{xy} = \sqrt{R^2 - 15^2} = \sqrt{30^2 - 15^2} = 25.98 \text{ MPa}$$

$$= 25.98 \times 10^6 \text{ Pa}$$

**Torsion:**

$$c_1 = 90 \text{ mm}$$

$$c_2 = 90 + 12 = 102 \text{ mm}$$

$$J = \frac{T}{2}\left(c_2^4 - c_1^4\right) = 66.968 \times 10^6 \text{ mm}^4 = 66.968 \times 10^{-6} \text{ m}^4$$

$$\tau_{xy} = \frac{Tc}{J} \quad T = \frac{Jr_{xy}}{c} = \frac{(66.968 \times 10^{-6})(25.98 \times 10^6)}{102 \times 10^{-3}} = 17.06 \times 10^3 \text{ N} \cdot \text{m}$$

PROBLEM 7.167

The brass pipe $AD$ is fitted with a jacket used to apply a hydrostatic pressure of 500 psi to portion $BC$ of the pipe. Knowing that the pressure inside the pipe is 100 psi, determine the maximum normal stress in the pipe.

SOLUTION

The only stress to be considered is the hoop stress. This stress can be obtained by applying

$$\sigma_1 = \frac{pr}{t}$$

Using successively the inside and outside pressures (the latter of which causes a compressive stress),

$$p_i = 100 \text{ psi}, \quad r_i = 1 - 0.12 = 0.88 \text{ in.}, \quad t = 0.12 \text{ in.}$$

$$\left(\sigma_{\text{max}}\right)_i = \frac{Pr_i}{t} = \frac{(100)(0.88)}{0.12} = +733.33 \text{ psi}$$

$$p_o = 500 \text{ psi}, \quad r_o = 1 \text{ in.}, \quad t = 0.12 \text{ in.}$$

$$\left(\sigma_{\text{max}}\right)_o = -\frac{Pr_o}{t} = -\frac{(500)(1)}{0.12} = -4166.7 \text{ psi}$$

$$\sigma_{\text{max}} = +733.33 - 4166.7 = -3433.4 \text{ psi}$$

$$\sigma_{\text{max}} = 3.43 \text{ ksi (compression)}$$
PROBLEM 7.168

For the assembly of Prob. 7.167, determine the normal stress in the jacket (a) in a direction perpendicular to the longitudinal axis of the jacket, (b) in a direction parallel to that axis.

PROBLEM 7.167 The brass pipe $AD$ is fitted with a jacket used to apply a hydrostatic pressure of 500 psi to portion $BC$ of the pipe. Knowing that the pressure inside the pipe is 100 psi, determine the maximum normal stress in the pipe.

SOLUTION

(a) Hoop stress.

\[ p = 500 \text{ psi}, \quad t = 0.15 \text{ in.}, \quad r = 2 - 0.15 = 1.85 \text{ in.} \]

\[ (\sigma_t) = \frac{pr}{t} = \frac{(500)(1.85)}{0.15} = 6166.7 \text{ psi} \]

\[ \sigma_t = 6.17 \text{ ksi} \]

(b) Longitudinal stress.

Free body of portion of jacket above a horizontal section, considering vertical forces only:

\[ + \sum F_y = 0: \]

\[ \int_A p dA_f - \int_A \sigma_2 dA_j = 0 \]

\[ p A_f - \sigma_2 A_j = 0 \]

\[ \sigma_2 = p \frac{A_f}{A_j} \quad (1) \]

Areas:

\[ A_f = \pi (r_2^2 - r_1^2) = \pi [(1.85)^2 - (1)^2] = 7.6105 \text{ in}^2 \]

\[ A_j = \pi (r_3^2 - r_2^2) = \pi [(2)^2 - (1.85)^2] = 1.81427 \text{ in}^2 \]

Recalling Eq (1):

\[ \sigma_2 = p \frac{A_f}{A_j} = (500) \frac{7.6105}{1.81427} = 2097.4 \text{ psi} \]

\[ \sigma_2 = 2.10 \text{ ksi} \]
PROBLEM 7.169

Determine the largest in-plane normal strain, knowing that the following strains have been obtained by the use of the rosette shown:

\[ \varepsilon_1 = -50 \times 10^{-6} \text{ in./in.} \]
\[ \varepsilon_2 = +360 \times 10^{-6} \text{ in./in.} \]
\[ \varepsilon_3 = +315 \times 10^{-6} \text{ in./in.} \]

SOLUTION

\[ \theta_1 = 45^\circ, \quad \theta_2 = -45^\circ, \quad \theta_3 = 0 \]

\[ \varepsilon_x \cos^2 \theta_1 + \varepsilon_y \sin^2 \theta_1 + \gamma_{xy} \sin \theta_1 \cos \theta_1 = \varepsilon_1 \]
\[ 0.5 \varepsilon_x + 0.5 \varepsilon_y + 0.5 \gamma_{xy} = -50 \times 10^{-6} \] \hspace{1cm} (1)

\[ \varepsilon_x \cos^2 \theta_2 + \varepsilon_y \sin^2 \theta_2 + \gamma_{xy} \sin \theta_2 \cos \theta_2 = \varepsilon_2 \]
\[ 0.5 \varepsilon_x + 0.5 \varepsilon_y - 0.5 \gamma_{xy} = 360 \times 10^{-6} \] \hspace{1cm} (2)

\[ \varepsilon_x \cos^2 \theta_3 + \varepsilon_y \sin^2 \theta_3 + \gamma_{xy} \sin \theta_3 \cos \theta_3 = \varepsilon_3 \]
\[ \varepsilon_x + 0 + 0 = 315 \times 10^{-6} \] \hspace{1cm} (3)

From (3), \[ \varepsilon_x = 315 \times 10^{-6} \text{ in/in} \]

Eq. (1) – Eq. (2):
\[ \gamma_{xy} = -50 \times 10^{-6} - 360 \times 10^{-6} = -410 \times 10^{-6} \text{ in/in} \]

Eq. (1) + Eq. (2):
\[ \varepsilon_x + \varepsilon_y = \varepsilon_1 + \varepsilon_2 \]
\[ \varepsilon_y = \varepsilon_1 + \varepsilon_2 - \varepsilon_x = -50 \times 10^{-6} + 360 \times 10^{-6} - 315 \times 10^{-6} = -5 \times 10^{-6} \text{ in/in} \]

\[ \varepsilon_{ave} = \frac{1}{2} (\varepsilon_x + \varepsilon_y) = 155 \times 10^{-6} \text{ in/in} \]

\[ R = \sqrt{\left(\frac{\varepsilon_x - \varepsilon_y}{2}\right)^2 + \left(\frac{\gamma_{xy}}{2}\right)^2} \]

PROBLEM 8.1

A W10×39 rolled-steel beam supports a load \( P \) as shown. Knowing that \( P = 45 \) kips, \( a = 10 \) in., and \( \sigma_{\text{all}} = 18 \) ksi, determine (a) the maximum value of the normal stress \( \sigma_n \) in the beam, (b) the maximum value of the principal stress \( \sigma_{\text{max}} \) at the junction of the flange and web, (c) whether the specified shape is acceptable as far as these two stresses are concerned.

SOLUTION

\[ |V|_{\text{max}} = 90 \text{ kips} \]
\[ |M|_{\text{max}} = (45)(10) = 450 \text{ kip \cdot in} \]

For W10×39 rolled steel section,
\( d = 9.92 \) in., \( b_f = 7.99 \) in., \( t_f = 0.530 \) in.,
\( t_w = 0.315 \) in., \( I_x = 209 \) in\(^4\), \( S_x = 42.1 \) in\(^3\),
\( c = \frac{1}{2}d = 4.96 \) in. \( y_b = c - t_f = 4.43 \) in.

(a) \[ \sigma_m = \frac{|M|_{\text{max}}}{S_x} = \frac{450}{42.1} \] \[ \sigma_m = 10.69 \text{ ksi} \]

\[ \sigma_b = \frac{V_f}{c} \sigma_m = \left( \frac{4.43}{4.96} \right) (10.69) = 9.55 \text{ ksi} \]

\[ A_f = b_f t_f = 4.2347 \text{ in}^2 \]

\[ \bar{y}_f = \frac{1}{2} (c + y_b) = 4.695 \text{ in.} \]

\[ Q_b = A_f \bar{y}_f = 19.8819 \text{ in}^3 \]

\[ \tau_{xy} = \frac{|V|_{\text{max}} Q_b}{I_x t_w} = \frac{(45)(19.8819)}{(209)(0.315)} = 13.5898 \text{ ksi} \]

\[ R = \sqrt{\left( \frac{\sigma_b}{2} \right)^2 + \tau_{xy}^2} = 14.4043 \text{ ksi} \]

(b) \[ \sigma_{\text{max}} = \frac{\sigma_b}{2} + R = 19.18 \text{ ksi} \]

\[ \sigma_{\text{max}} = 19.18 \text{ ksi} \]

(c) Since \( \sigma_{\text{max}} > \sigma_{\text{all}} (= 18 \) ksi), W10×39 is not acceptable.
PROBLEM 8.2

Solve Prob. 8.1, assuming that $P = 22.5$ kips and $a = 20$ in.

PROBLEM 8.1 A $W_{10\times39}$ rolled-steel beam supports a load $P$ as shown. Knowing that $P = 45$ kips, $a = 10$ in., and $\sigma_{all} = 18$ ksi, determine (a) the maximum value of the normal stress $\sigma_m$ in the beam, (b) the maximum value of the principal stress $\sigma_{max}$ at the junction of the flange and web, (c) whether the specified shape is acceptable as far as these two stresses are concerned.

SOLUTION

For $W_{10\times39}$ rolled steel section,

$\begin{align*}
  d &= 9.92 \text{ in.}, \\
  b_f &= 7.99 \text{ in.}, \\
  t_f &= 0.530 \text{ in.}, \\
  t_w &= 0.315 \text{ in.}, \\
  I_x &= 209 \text{ in}^4, \\
  S_x &= 42.1 \text{ in}^3 \\
  c &= \frac{1}{2}d = 4.96 \text{ in.} \\
  y_b &= c - t_f = 4.43 \text{ in.}
\end{align*}$

(a) $\sigma_m = \frac{|M|_{max}}{S_x} = \frac{450}{42.1} = 10.69 \text{ ksi}$

$\sigma_b = \frac{y_b}{c} \sigma_m = \left(\frac{4.43}{4.96}\right)(10.69) = 9.55 \text{ ksi}$

$A_f = b_f t_f = 4.2347 \text{ in}^2$

$\overline{y}_f = \frac{1}{2}(c + y_b) = 4.695 \text{ in.}$

$Q_b = A_f \overline{y}_f = 19.8819 \text{ in}^3$

$\tau_{xy} = \frac{|V|_{max}Q_b}{I_x t_w} = \frac{(22.5)(19.8819)}{(209)(0.315)} = 6.7949 \text{ ksi}$

$R = \sqrt{\frac{\sigma_b}{2}^2 + \tau_{xy}^2} = 8.3049 \text{ ksi}$

(b) $\sigma_{max} = \frac{\sigma_b}{2} + R = 13.08 \text{ ksi}$

(c) Since $\sigma_{max} < \sigma_{all} (= 18 \text{ ksi})$, $W_{10\times39}$ is acceptable.
PROBLEM 8.3

An overhanging W920×449 rolled-steel beam supports a load P as shown. Knowing that \( P = 700 \text{ kN} \), \( a = 2.5 \text{ m} \), and \( \sigma_{\text{all}} = 100 \text{ MPa} \), determine (a) the maximum value of the normal stress \( \sigma_m \) in the beam, (b) the maximum value of the principal stress \( \sigma_{\text{max}} \) at the junction of the flange and web, (c) whether the specified shape is acceptable as far as these two stresses are concerned.

SOLUTION

\( |V|_{\text{max}} = 700 \text{ kN} = 700 \times 10^3 \text{ N} \)
\( |M|_{\text{max}} = (700 \times 10^3)(2.5) = 1.75 \times 10^6 \text{ N} \cdot \text{m} \)

For W920×449 rolled steel beam,
\( d = 947 \text{ mm} \), \( b_f = 424 \text{ mm} \), \( t_f = 42.7 \text{ mm} \),
\( t_w = 24.0 \text{ mm} \), \( I_x = 8780 \times 10^6 \text{ mm}^4 \), \( S_x = 18,500 \times 10^3 \text{ mm}^3 \)
\( c = \frac{1}{2} d = 473.5 \text{ mm} \), \( y_b = c - t_f = 430.8 \text{ mm} \)

(a) \( \sigma_m = \frac{|M|_{\text{max}}}{S_x} = \frac{1.75 \times 10^6}{18500 \times 10^{-6}} \sigma_m = 94.595 \text{ MPa} \)
\( \sigma_m = 94.6 \text{ MPa} \) ▲

\( \sigma_b = \frac{y_b}{c} \sigma_m = \frac{430.8}{473.5} (94.595) = 86.064 \text{ MPa} \)
\( A_f = b_f t_f = 18.1048 \times 10^3 \text{ mm}^2 \)
\( \bar{y}_f = \frac{1}{2}(c + y_b) = 452.15 \text{ mm} \)
\( Q_b = A_f \bar{y}_f = 8186.1 \times 10^3 \text{ mm}^3 = 8186.1 \times 10^{-6} \text{ m}^3 \)
\( \tau_{xy} = \frac{|V|_{\text{max}} Q_b}{I_x t_w} = \frac{(700 \times 10^3)(8186.1 \times 10^{-6})}{(8780 \times 10^6)(24.0 \times 10^{-3})} = 27.194 \text{ MPa} \)
\( R = \left( \frac{\sigma_b}{2} \right)^2 + \tau_{xy}^2 = \left( \frac{86.064}{2} \right)^2 + 27.194^2 = 50.904 \text{ MPa} \)

(b) \( \sigma_{\text{max}} = \frac{\sigma_b}{2} + R = 93.9 \text{ MPa} \)
\( \sigma_{\text{max}} = 93.9 \text{ MPa} \) ▲

(c) Since 94.6 MPa < \( \sigma_{\text{all}} (= 100 \text{ MPa}) \),
\( W920 \times 449 \) is acceptable. ▲
**PROBLEM 8.4**

Solve Prob. 8.3, assuming that $P = 850$ kN and $a = 2.0$ m.

**PROBLEM 8.3** An overhanging W920 × 449 rolled-steel beam supports a load $P$ as shown. **SOLUTION**

$$|V|_{\text{max}} = 850 \text{ kN} = 850 \times 10^3 \text{ N}$$

$$|M|_{\text{max}} = (850 \times 10^3)(2.0) = 1.70 \times 10^6 \text{ N} \cdot \text{m}$$

For W920 × 449 rolled steel section,

$$d = 947 \text{ mm}, \quad b_f = 424 \text{ mm}, \quad t_f = 42.7 \text{ mm},$$

$$t_w = 24.0 \text{ mm}, \quad I_x = 8780 \times 10^6 \text{ mm}^4, \quad S_x = 18500 \times 10^3 \text{ mm}^3$$

$$c = \frac{1}{2}d = 473.5 \text{ mm} \quad y_b = c - t_f = 430.8 \text{ mm}$$

(a) 

$$\sigma_m = \frac{|M|_{\text{max}}}{S_x} = \frac{1.70 \times 10^6}{18,500 \times 10^{-6}} = 91.892 \text{ MPa}$$

$$\sigma_m = 91.9 \text{ MPa} \quad \Box$$

$$\sigma_b = \frac{y_b}{c} \sigma_m = \frac{430.8}{473.5} (91.892) = 83.605 \text{ MPa}$$

$$A_f = b_f t_f = 18.1048 \times 10^3 \text{ mm}^2$$

$$\bar{y}_f = \frac{1}{2}(c + y_b) = 452.15 \text{ mm}$$

$$Q_b = A_f \bar{y}_f = 8186.1 \times 10^3 \text{ mm}^3 = 8186.1 \times 10^{-6} \text{ m}^3$$

$$\tau_{xy} = \frac{|V|_{\text{max}} Q_b}{I_x t_w} = \frac{(850 \times 10^3)(8186.1 \times 10^{-6})}{(8780 \times 10^6)(24.0 \times 10^{-3})} = 33.021 \text{ MPa}$$

$$R = \sqrt{\left(\frac{\sigma_b}{2}\right)^2 + \tau_{xy}^2} = \sqrt{\left(\frac{83.605}{2}\right)^2 + 33.021^2} = 53.271 \text{ MPa}$$

(b) 

$$\sigma_{max} = \frac{\sigma_b}{2} + R = 95.1 \text{ MPa}$$

$$\sigma_{max} = 95.1 \text{ MPa} \quad \Box$$

(c) 

Since $95.1 \text{ MPa} < \sigma_{all} (= 100 \text{ MPa}), \quad \text{W920} \times 449 \text{ is acceptable.} \quad \Box$

PROBLEM 8.9

The following problem refers to a rolled-steel shape selected in a problem of Chap. 5 to support a given loading at a minimal cost while satisfying the requirement $\sigma_m \leq \sigma_{all}$. For the selected design (use the loading of Prob. 5.73 and selected W530 $\times$ 66 shape), determine $(a)$ the actual value of $\sigma_m$ in the beam, $(b)$ the maximum value of the principal stress $\sigma_{max}$ at the junction of a flange and the web.

SOLUTION

From Prob. 5.73, $\sigma_{all} = 160$ MPa

$|M|_{\text{max}} = 180$ kN$\cdot$m at section $B$.

$|V| = 72$ kN at section $B$.

For W530 $\times$ 66 rolled steel section,

$d = 526$ mm, $b_f = 165$ mm, $t_f = 11.4$ mm,

$t_w = 8.89$ mm, $I = 351 \times 10^6$ mm$^4$, $S = 1340 \times 10^3$ mm$^3$

$c = \frac{1}{2}d = 263$ mm

PROBLEM 8.21

It was stated in Sec. 8.3 that the shearing stresses produced in a shaft by the transverse loads are usually much smaller than those produced by the torques. In the preceding problems, their effect was ignored and it was assumed that the maximum shearing stress in a given section occurred at point \( H \) (Fig. P8.21a) and was equal to the expression obtained in Eq. (8.5), namely,

\[
\tau_H = \frac{c}{J} \sqrt{M^2 + T^2}
\]

Show that the maximum shearing stress at point \( K \) (Fig. P8.21b), where the effect of the shear \( V \) is greatest, can be expressed as

\[
\tau_K = \frac{c}{J} \sqrt{(M \cos \beta)^2 + \left(\frac{2}{3} V + T\right)^2}
\]

where \( \beta \) is the angle between the vectors \( V \) and \( M \). It is clear that the effect of the shear \( V \) cannot be ignored when \( \tau_K \geq \tau_H \). (Hint: Only the component of \( M \) along \( V \) contributes to the shearing stress at \( K \).)

SOLUTION

Shearing stress at point \( K \).

Due to \( V \):

For a semicircle,

\[ Q = \frac{2}{3} c^3 \]

For a circle cut across its diameter,

\[ t = d = 2c \]

For a circular section,

\[ I = \frac{1}{2} J \]

\[
\tau_{xy} = \frac{VQ}{It} = \frac{(V)\left(\frac{2}{3} c^3\right)}{\left(\frac{1}{2} J\right)(2c)} = \frac{2 Vc^2}{3 J}
\]

Due to \( T \):

\[
\tau_{xy} = \frac{Tc}{J}
\]

Since these shearing stresses have the same orientation,

\[
\tau_{xy} = \frac{c}{J} \left(\frac{2}{3} Vc + T\right)
\]
PROBLEM 8.21 (Continued)

Bending stress at point $K$:

$$\sigma_x = \frac{M_u}{I} = \frac{2M_u}{J}$$

where $u$ is the distance between point $K$ and the neutral axis,

$$u = c \sin \alpha = c \sin \left( \frac{\pi}{2} - \beta \right) = c \cos \beta$$

$$\sigma_x = \frac{2Mc \cos \beta}{J}$$

Using Mohr’s circle,

$$\tau_K = R = \sqrt{\left( \frac{\sigma_x}{2} \right)^2 + \tau_{xy}^2}$$

$$= \frac{c}{J} \sqrt{(M \cos \beta)^2 + \left( \frac{2}{3} Vc + T \right)^2}$$

**SOLUTION**

From Prob. 8.15, shaft diameter $= 1.75$ in.

$$c = \frac{d}{2} = 0.875 \text{ in.}$$

$$J = \frac{\pi}{2} c^4 = 0.92077$$

Torque over portion $ABC$:

$$T = (6)(1080) = (8)(810) = 6480 \text{ lb \cdot in}$$

$$\tau_H = \frac{c}{J} \sqrt{M^2 + T^2} = \frac{0.875}{0.92077} \sqrt{(3240)^2 + (6480)^2}$$

$$\tau_H = 6880 \text{ psi}$$

$$\tau_K = \frac{c}{J} \sqrt{(M \cos \beta)^2 + \left(\frac{2}{3} V_C + T\right)^2} = \frac{c}{J} \left[\frac{2}{3} V_C + T\right]$$

$$\tau_K = \frac{0.875}{0.92077} \left[\frac{2}{3}(1080)(0.875) + 6480\right]$$

$$\tau_K = 6760 \text{ psi}$$

\]

\[
M = \sqrt{(1620)^2 + (4050)^2} = 4362 \text{ lb} \cdot \text{in}

\[
\gamma = \tan^{-1} \frac{1620}{4050} = 21.80^\circ
\]

\[
\beta = 90^\circ - 21.8^\circ - 21.8^\circ = 46.4^\circ

\[
\tau_H = \frac{0.875}{0.92077} \sqrt{(6480)^2 + (4362)^2} \quad \tau_H = 7420 \text{ psi}

\[
\frac{2}{3} V_C + T = \left(\frac{2}{3}\right)(436.2)(0.875) + 6480 = 6734 \text{ lb} \cdot \text{in}

Forces in horizontal plane:
PROBLEM 8.30

Solve Prob. 8.29, assuming that 30 hp is taken off at gear $G$ and 30 hp is taken off at gear $H$.

PROBLEM 8.29 The solid shaft $AE$ rotates at 600 rpm and transmits 60 hp from the motor $M$ to machine tools connected to gears $G$ and $H$. Knowing that $\tau_{all} = 8\text{ ksi}$ and that 40 hp is taken off at gear $G$ and 20 hp is taken off at gear $H$, determine the smallest permissible diameter of shaft $AE$.

SOLUTION

60 hp = (60)(6600)

\[= 396 \times 10^3 \text{ in} \cdot \text{lb/sec}\]

\[f = \frac{600 \text{ rpm}}{60 \text{ sec/ min}} = 10 \text{ Hz}\]

Torque on gear $B$:

\[T_B = \frac{P}{2\pi f} = \frac{396 \times 10^3}{2\pi(10)} = 6302.5 \text{ lb} \cdot \text{in}\]

Torques on gears $C$ and $D$:

\[T_C = \frac{30}{60} T_B = 3151.3 \text{ lb} \cdot \text{in}\]

\[T_D = \frac{30}{60} T_B = 3151.3 \text{ lb} \cdot \text{in}\]

Shaft torques:

\[AB: \quad T_{AB} = 0\]

\[BC: \quad T_{BC} = 6302.5 \text{ lb} \cdot \text{in}\]

\[CD: \quad T_{CD} = 3151.3 \text{ lb} \cdot \text{in}\]

\[DE: \quad T_{DE} = 0\]
PROBLEM 8.30 (Continued)

Gear forces:

\[
F_B = \frac{T_B}{r_B} = \frac{6302.5}{3} = 2100.8 \text{ lb}
\]

\[
F_C = \frac{T_C}{r_C} = \frac{3151.3}{4} = 787.8 \text{ lb}
\]

\[
F_D = \frac{T_D}{r_D} = \frac{3151.3}{4} = 787.8 \text{ lb}
\]

At \( B^+ \), \( \sqrt{M_z^2 + M_y^2 + T^2} = \sqrt{1838.2^2 + 6214.9^2 + 6302.5^2} \)

\[= 9040.2 \text{ lb \cdot in (maximum)} \]

At \( C^- \), \( \sqrt{M_z^2 + M_y^2 + T^2} = \sqrt{4595.5^2 + 2932.4^2 + 6302.5^2} \)

\[= 8333.0 \text{ lb \cdot in} \]

\[
\tau_{all} = \frac{c}{J} \left( \sqrt{M_z^2 + M_y^2 + T^2} \right)_{\text{max}}
\]

\[
J = \frac{\pi c^3}{2} = \frac{\left( \sqrt{M_z^2 + M_y^2 + T^2} \right)}{\tau_{all}}
\]

\[
= \frac{9040.3}{8 \times 10^4} = 1.1300 \text{ in}^3

A 6-kip force is applied to the machine element $AB$ as shown. Knowing that the uniform thickness of the element is 0.8 in., determine the normal and shearing stresses at (a) point $a$, (b) point $b$, (c) point $c$.

SOLUTION

Thickness = 0.8 in.

At the section containing points $a$, $b$, and $c$,

\[ P = 6 \cos 35^\circ = 4.9149 \text{ kips} \quad V = 6 \sin 35^\circ = 3.4415 \text{ kips} \]

\[ M = (6 \sin 35^\circ)(16) - (6 \cos 35^\circ)(8) = 15.744 \text{ kip \cdot in} \]

\[ A = (0.8)(3.0) = 2.4 \text{ in}^2 \]

\[ I = \frac{1}{12} (0.8)(3.0)^3 = 1.80 \text{ in}^4 \]

(a) At point $a$: \[ \sigma_x = \frac{P}{A} - \frac{M c}{I} = \frac{4.9149}{2.4} - \frac{(15.744)(1.5)}{1.80} \]

\[ \tau_{xy} = 0 \]

(b) At point $b$: \[ \sigma_x = \frac{P}{A} = \frac{4.9149}{2.4} \]

\[ \tau_{xy} = \frac{3 V}{2 A} = \frac{3}{2} \cdot \frac{3.4415}{2.4} \]

\[ \tau_{xy} = 2.15 \text{ ksi} \]

(c) At point $c$: \[ \sigma_x = \frac{P}{A} + \frac{M c}{I} = \frac{4.9149}{2.4} + \frac{(15.744)(1.5)}{1.80} \]

\[ \sigma_x = 15.17 \text{ ksi} \]

A 6-kip force is applied to the machine element $AB$ as shown. Knowing that the uniform thickness of the element is 0.8 in., determine the normal and shearing stresses at (a) point $d$, (b) point $e$, (c) point $f$.

SOLUTION

Thickness = 0.8 in.

At the section containing points $d$, $e$, and $f$,

\[ P = 6 \cos 35^\circ = 4.9149 \text{ kips} \quad V = 6 \sin 35^\circ = 3.4415 \text{ kips} \]

\[ M = (6 \sin 35^\circ)(8) - (6 \cos 35^\circ)(8) = -11.788 \text{ kip \cdot in} \]

\[ A = (0.8)(3.0) = 2.4 \text{ in}^2 \]

\[ I = \frac{1}{12}(0.8)(3.0)^3 = 1.80 \text{ in}^4 \]

(a) At point $d$:

\[ \sigma_x = \frac{P}{A} - \frac{Mc}{I} = \frac{4.9149}{2.4} + \frac{(11.788)(1.5)}{1.8} \quad \sigma_x = 11.87 \text{ ksi} \]

(c) At point $f$:

\[ \sigma_x = \frac{P}{A} + \frac{Mc}{I} = \frac{4.9149}{2.4} - \frac{(11.788)(1.5)}{1.8} \quad \sigma_x = -7.78 \text{ ksi} \]

\[ \tau_{xy} = 0 \]
PROBLEM 8.33

For the bracket and loading shown, determine the normal and shearing stresses at (a) point $a$, (b) point $b$.

SOLUTION

Draw free body diagram of portion below section $ab$.

From statics:

$P = 4000 \cos 60^\circ = 2000$ N

$V = 4000 \sin 60^\circ = 3464.1$ N

$M = (0.1)(4000)\sin 60^\circ = 346.41$ N $\cdot$ m

Section properties:

$A = (0.018)(0.040) = 720 \times 10^{-6}$ m$^2$

$I = \frac{1}{12} (0.018)(0.040)^3 = 96 \times 10^{-9}$ m$^4$

(a) Point $a$:

$\sigma = \frac{P}{A} \frac{Mc}{I} = \frac{2000}{720 \times 10^{-6}} - \frac{(346.41)(0.02)}{96 \times 10^{-9}}$

$= -74.9 \times 10^6$ Pa

$\sigma = -74.9$ MPa $\uparrow$

$\tau = 0$ $\uparrow$

(b) Point $b$:

$\sigma = -\frac{P}{A} = -\frac{2000}{720 \times 10^{-6}}$

$\sigma = -2.78$ MPa $\uparrow$

$\tau = \frac{VQ}{It} = \frac{(3464.1)(3.6 \times 10^{-5})}{(96 \times 10^{-9})(0.018)} = 7.22 \times 10^6$ Pa

$\tau = 7.22$ MPa $\uparrow$

\[ + \sum F_y = 0: \ 2.25\sin 30^\circ - 9 + B_y = 0 \]
\[ B_y = 7.875 \text{kN} \uparrow \]

At the section containing points \( H \) and \( K \),

\[ P = 7.875\cos 30^\circ + 1.9486\sin 30^\circ = 7.794 \text{kN} \]
\[ V = 7.875\sin 30^\circ - 1.9486\cos 30^\circ = 2.25 \text{kN} \]
\[ M = (7.875 \times 10^3)(40 \times 10^{-3} \sin 30^\circ) \]
\[ - (1.9486 \times 10^3)(40 \times 10^{-3} \cos 30^\circ) \]
\[ = 90 \text{N} \cdot \text{m} \]
\[ A = 10 \times 24 = 240 \text{mm}^2 = 240 \times 10^{-6} \text{m}^2 \]
\[ I = \frac{1}{12}(10)(24)^3 = 11.52 \times 10^3 \text{mm}^4 = 11.52 \times 10^{-9} \text{m}^4 \]

\( a \) At point \( H \),

\[ \Sigma F_x = 0: \quad 2.598 - B_x = 0 \quad \therefore B_x = 2.598 \text{ kN} \leftarrow \]

At the section containing points H and K,

\[ = 90 \text{ N m} \]
\[ A = 10 \times 240 = 240 \text{ mm}^2 = 240 \times 10^{-6} \text{ m}^2 \]
\[ I = \frac{1}{12} (10)(24)^3 = 11.52 \times 10^3 \text{ mm}^4 = 11.52 \times 10^{-9} \text{ m}^4 \]

(a) At point H:

Several forces are applied to the pipe assembly shown. Knowing that the pipe has inner and outer diameters equal to 1.61 and 1.90 in., respectively, determine the normal and shearing stresses at (a) point H, (b) point K.

SOLUTION

Section properties:

\[ P = 150 \text{ lb} \]
\[ T = (200 \text{ lb})(10 \text{ in.}) = 2000 \text{ lb} \cdot \text{in} \]
\[ M_z = (150 \text{ lb})(10 \text{ in.}) = 1500 \text{ lb} \cdot \text{in} \]

A thin strap is wrapped around a solid rod of radius $c = 20$ mm as shown. Knowing that $l = 100$ mm and $F = 5$ kN, determine the normal and shearing stresses at (a) point $H$, (b) point $K$.

SOLUTION

At the section containing points $H$ and $K$,

$T = Fc \quad M = Fl \quad V = F$

$J = \frac{\pi}{2} c^4 \quad I = \frac{\pi}{4} c^4$

Point $H$:

$\sigma = \frac{Mc}{I} = \frac{Fcl}{\frac{\pi}{4} c^4} \quad \sigma = \frac{4Fl}{\pi c^2}$

$\tau = \frac{Tc}{J} = \frac{Fc^2}{\frac{\pi}{4} c^4} \quad \tau = \frac{2F}{\pi c^2}$

Point $K$: Point $K$ lies on the neutral axis. $\sigma = 0$

Due to torque: $\tau = \frac{Tc}{J} = \frac{2F}{\pi c^2}$

Due to shear: For a semicircle, $Q = \frac{2}{3} c^3$, $t = d = 2c$

$\tau = \frac{VQ}{lt} = \frac{F \frac{2}{3} c^3}{\frac{\pi}{4} c^4 (2c)} = \frac{4F}{3\pi c^2}$

Combined. $\tau = \frac{2F}{\pi c^2} + \frac{4F}{3\pi c^2} \quad \tau = \frac{10F}{3\pi c^2}$

A vertical force $P$ of magnitude 60 lb is applied to the crank at point $A$. Knowing that the shaft $BDE$ has a diameter of 0.75 in., determine the principal stresses and the maximum shearing stress at point $H$ located at the top of the shaft, 2 in. to the right of support $D$.

SOLUTION

Force-couple system at the centroid of the section containing point $H$:

- $F_x = 0$, $V_y = -0.06$ kips, $V_z = 0$
- $M_z = -(5 - 2 + 1)(0.06) = -0.24$ kip · in
- $M_x = -(8 \sin 60^\circ)(0.06) = -0.41569$ kip · in
- $d = 0.75$ in., $c = \frac{1}{2}d = 0.375$ in.

$I = \frac{\pi}{4}d^4 = \frac{\pi}{4}(0.375)^4 = 15.5316 \times 10^{-3}$ in$^4$

$J = 2J = 31.063 \times 10^{-3}$ in$^4$

At point $H$:

$\sigma_H = -\frac{M_{zy}}{I_z} = -\frac{(-0.24)(0.375)}{15.5316 \times 10^{-3}} = 5.7946$ ksi

$\tau_H = \frac{Tc}{J} = \frac{(0.41569)(0.375)}{31.063 \times 10^{-3}} = 5.0183$ ksi

Use Mohr’s circle:

$\sigma_{ave} = \frac{1}{2}\sigma_H = 2.8973$ ksi

$R = \sqrt{\left(\frac{\sigma_H}{2}\right)^2 + \tau_H^2} = 5.7946$ ksi

$\sigma_a = \sigma_{ave} + R$

$\sigma_b = \sigma_{ave} - R$

$\tan 2\theta = \frac{2\tau_H}{\sigma_H} = \frac{2(5.0183)}{5.7946} = 1.7321$

$\theta_a = 30.0^\circ$ $\quad \theta_b = 120.0^\circ$

PROBLEM 8.42

A 13-kN force is applied as shown to the 60-mm-diameter cast-iron post $ABD$. At point $H$, determine $(a)$ the principal stresses and principal planes, $(b)$ the maximum shearing stress.

SOLUTION

$DE = \sqrt{125^2 + 300^2} = 325$ mm

At point $D$,

$F_x = 0$

$F_y = -\left(\frac{300}{325}\right)(13) = -12$ kN

$F_z = -\left(\frac{125}{300}\right)(13) = -5$ kN

Moment of equivalent force-couple system at $C$, the centroid of the section containing point $H$:

$$
\vec{M} = \begin{bmatrix}
0.150 & 0.200 & 0 \\
0 & -12 & -5
\end{bmatrix}
= -1.00\hat{i} + 0.75\hat{j} - 1.8\hat{k}$ kN \cdot m

Section properties:

$d = 60$ mm, $c = \frac{1}{2}d = 30$ mm

$A = \pi c^2 = 2.8274 \times 10^3 \text{ mm}^2$

$I = \frac{\pi}{4}c^4 = 636.17 \times 10^3 \text{ mm}^4$

$J = 2I = 1.2723 \times 10^6 \text{ mm}^4$

For a semicircle,

$Q = \frac{2}{3}c^3 = 18.00 \times 10^3 \text{ mm}^3$
PROBLEM 8.42 (Continued)

At point $H$, 

$$
\sigma_H = \frac{P}{A} - \frac{Mc}{I} = \frac{12 \times 10^3}{2.8274 \times 10^{-3}} - \frac{(1.8 \times 10^3)(30 \times 10^{-3})}{636.17 \times 10^{-9}} = -89.13 \text{ MPa}
$$

$$
\tau_H = \frac{T_c}{J} + \frac{VQ}{Jt} = \frac{(0.75 \times 10^7)(30 \times 10^{-3})}{1.2723 \times 10^{-6}} + \frac{(5 \times 10^3)(18.00 \times 10^{-6})}{(636.17 \times 10^{-9})(60 \times 10^{-3})} = 20.04 \text{ MPa}
$$

(a) 

$$
\sigma_{ave} = \frac{\sigma_H}{2} = -44.565 \text{ MPa}
$$

$$
R = \sqrt{\left(\frac{\sigma_H}{2}\right)^2 + \tau_H^2} = 48.863 \text{ MPa}
$$

$$
\sigma_a = \sigma_{ave} + R \quad \sigma_a = 4.3 \text{ MPa} \uparrow
$$

$$
\sigma_b = \sigma_{ave} - R \quad \sigma_b = -93.4 \text{ MPa} \uparrow
$$

$$
\tan 2\theta_P = \frac{2\tau_H}{\sigma_H} = 0.4497
$$

$$
\theta_a = 12.1^\circ, \quad \theta_b = 102.1^\circ \uparrow
$$

$$
\tau_{max} = R = 48.9 \text{ MPa} \uparrow

PROBLEM 8.43

A 10-kN force and a 1.4-kN \cdot m couple are applied at the top of the 65-mm diameter brass post shown. Determine the principal stresses and maximum shearing stress at (a) point H, (b) point K.

SOLUTION

At the section containing points H and K,

\[ V = 10 \text{kN} = 10 \times 10^3 \text{ N} \]
\[ M = (10 \times 10^3)(240 \times 10^{-3}) = 2.4 \times 10^3 \text{ N} \cdot \text{m} \]
\[ T = 1.4 \times 10^3 \text{ N} \cdot \text{m} \]
\[ c = \frac{1}{2}d = 32.5 \text{ mm} = 0.0325 \text{ m} \]
\[ J = \frac{\pi}{2}c^4 = 1.75248 \times 10^{-6} \text{ m}^4 \]
\[ I = \frac{1}{2}J = 0.87624 \times 10^{-6} \text{ m}^4 \]

For a semicircle,
\[ Q = \frac{2}{3}c^3 = \frac{2}{3}(0.0325)^3 = 22.885 \times 10^{-6} \text{ m}^3 \]

(a) Stresses at point H.

H lies on the neutral axis: \( \sigma = 0 \)

Due to torque:
\[ \tau = \frac{Te}{J} = \frac{(1.4 \times 10^3)(0.0325)}{1.75248 \times 10^{-6}} \]
\[ = 25.963 \text{ MPa} \]

Due to shear:
\[ \tau = \frac{VQ}{Ut} = \frac{(10 \times 10^3)(22.885 \times 10^{-6})}{(0.87624 \times 10^{-6})(0.065)} \]
\[ = 4.018 \text{ MPa} \]

Total at H:
\[ \tau = 30.0 \text{ MPa} \]
\[ \sigma_{\text{ave}} = 0, \quad R = 30.0 \text{ MPa} \]
\[ \sigma_{\text{max}} = \sigma_{\text{ave}} + R \]
\[ \sigma_{\text{max}} = 30.0 \text{ MPa} \]
\[ \sigma_{\text{min}} = \sigma_{\text{ave}} - R \]
\[ \sigma_{\text{min}} = -30.0 \text{ MPa} \]
\[ \tau_{\text{max}} = R \]
\[ \tau_{\text{max}} = 30.0 \text{ MPa} \]
(b) Stresses at point $K$.

Due to shear: $\tau = 0$

Due to torque: $\tau = \frac{T_c}{J} = 25.963$ MPa

Due to bending: $\sigma = \frac{-M_c}{I} = \frac{(2.4 \times 10^3)(0.0325)}{(0.87624 \times 10^{-6})} = -89.016$ MPa

$\sigma_{ave} = \frac{-89.016}{2} = -44.508$ MPa

$R = \sqrt{\left(\frac{89.016}{2}\right)^2 + (25.963)^2} = 51.527$ MPa

$\sigma_{max} = \sigma_{ave} + R$

$\sigma_{min} = \sigma_{ave} - R$

$\tau_{max} = R$

$\sigma_{max} = 7.02$ MPa

$\sigma_{min} = -96.0$ MPa

$\tau_{max} = 51.5$ MPa
PROBLEM 8.44

Forces are applied at points \( A \) and \( B \) of the solid cast-iron bracket shown. Knowing that the bracket has a diameter of 0.8 in., determine the principal stresses and the maximum shearing stress at (a) point \( H \), (b) point \( K \).

SOLUTION

At the section containing points \( H \) and \( K \),

\[
\begin{align*}
P & = 2500 \text{ lb (compression)} \\
V_y & = -600 \text{ lb} \\

J & = 2I = 40.212 \times 10^{-3} \text{ in}^4
\end{align*}
\]

For semicircle,

\[
\begin{align*}
Q & = \frac{2}{3}c^3 \\
& = 42.667 \times 10^{-3} \text{ in}^3
\end{align*}
\]
PROBLEM 8.44 (Continued)

(a) At point $H$:

\[

\[
\tau_H = \frac{T_c}{J} = \frac{(1500)(0.4)}{40.212 \times 10^{-3}} = 14.92 \times 10^3 \text{ psi}

\[
\sigma_{ave} = \frac{24.87}{2} = 12.435 \text{ ksi}
\]

\[
R = \sqrt{\left(\frac{24.87}{2}\right)^2 + (14.92)^2} = 19.423 \text{ ksi}

\[
\sigma_{max} = \sigma_{ave} + R
\]

\[
\sigma_{min} = \sigma_{ave} - R
\]

\[
\tau_{max} = \frac{1}{2}(\sigma_{max} - \sigma_{min})
\]

(b) At point $K$:

\[
\sigma_K = \frac{P}{A} = \frac{-2500}{0.50265} = -4.974 \times 10^3 \text{ psi}
\]

\[
\tau_K = \frac{T_c + VQ}{J + It}
\]

\[
= \frac{(1500)(0.4)}{40.212 \times 10^{-3}} + \frac{(600)(42.667 \times 10^{-3})}{(20.106 \times 10^{-3})(0.8)} = 16.512 \times 10^3 \text{ psi}
\]

\[
\sigma_{ave} = \frac{-4.974}{2} = -2.487 \text{ ksi}
\]

\[
R = \sqrt{\left(\frac{-4.974}{2}\right)^2 + (16.512)^2} = 16.698 \text{ ksi}

PROBLEM 8.50

For the post and loading shown, determine the principal stresses, principal planes, and maximum shearing stress at point $K$.

SOLUTION

Components of force at point $C$:

\[ F_x = 50 \cos 30^\circ = 43.301 \text{ kN} \]
\[ F_z = -50 \sin 30^\circ = -25 \text{ kN} \quad F_y = -120 \text{ kN} \]

Section forces and couples at the section containing points $H$ and $K$:

\[ P = 120 \text{ kN} \text{ (compression)} \]
\[ V_x = 43.301 \text{ kN}, \quad V_z = -25 \text{ kN} \]
\[ M_x = -(25)(0.375) = -9.375 \text{ kN} \cdot \text{m} \]
\[ M_y = 0 \]
\[ M_z = -(43.301)(0.375) = -16.238 \text{ kN} \cdot \text{m} \]

\[ A = (100)(150) = 15 \times 10^3 \text{ mm}^2 \]
\[ = 15 \times 10^{-3} \text{ m}^2 \]
\[ I_z = \frac{1}{12}(100)(150)^3 = 28.125 \times 10^6 \text{ mm}^4 \]
\[ = 28.125 \times 10^{-6} \text{ m}^4 \]
PROBLEM 8.50 (Continued)

Stresses at point $K$:

$$\sigma_K = \frac{P}{A} + \frac{M_x}{I_z} = \frac{120 \times 10^3}{15 \times 10^{-3}} + \frac{(-16.238 \times 10^3)(75 \times 10^{-3})}{28.125 \times 10^{-6}} = -51.3 \text{ MPa}$$

$$\tau_K = \frac{3 V_z}{2 A} = \frac{3 \times 25 \times 10^3}{2 \times 15 \times 10^{-3}} = 2.5 \text{ MPa}$$

Use Mohr’s circle.

$$\sigma_{ave} = \frac{1}{2} \sigma_K = -25.65 \text{ MPa}$$

$$R = \sqrt{\left(\frac{51.3}{2}\right)^2 + (2.5)^2} = 25.77 \text{ MPa}$$

$$\sigma_a = \sigma_{ave} + R \quad \sigma_a = 0.12 \text{ MPa}$$

$$\sigma_b = \sigma_{ave} - R \quad \sigma_b = -51.4 \text{ MPa}$$

$$\theta_p = \tan^{-1} \left(\frac{2\tau_K}{\sigma_K}\right) = 0.09747$$

$$\theta_a = 2.8^\circ \quad \theta_b = 92.8^\circ$$

$$\tau_{max} = R \quad \tau_{max} = 25.8 \text{ MPa}$$

Two forces are applied to the small post $BD$ as shown. Knowing that the vertical portion of the post has a cross section of $1.5 \times 2.4$ in., determine the principal stresses, principal planes, and maximum shearing stress at point $H$.

SOLUTION

Components of 500-lb force:

$$F_x = \frac{(500)(1.75)}{6.25} = 140 \text{ lb}$$

$$F_y = -\frac{(500)(6)}{6.25} = -480 \text{ lb}$$

Moment arm of 500-lb force:

$$\vec{r} = 3.25\vec{i} + (6 - 1)\vec{j}$$

Moment of 500-lb force:

$$\vec{M} = \begin{bmatrix} 3.25 & 5 & 0 \\ 140 & -480 & 0 \end{bmatrix} = -2260\vec{k} \text{ lb \cdot in}$$

At the section containing point $H$,

$P = -480 \text{ lb} \quad V_A = 140 \text{ lb}$

$$V_z = -6000 \text{ lb}, \quad M_z = -2260 \text{ lb \cdot in}, \quad M_x = -(4)(6000) = -24,000 \text{ lb \cdot in}$$

$$A = (1.5)(2.4) = 3.6 \text{ in}^2 \quad I_z = \frac{1}{12}(2.4)(1.5)^3 = 0.675 \text{ in}^4$$

$$\sigma_H = \frac{P}{A} + \frac{M_x}{I_z} = \frac{-480}{3.6} + \frac{(-2260)(0.75)}{0.675} = -2644 \text{ psi}$$

$$\tau_H = \frac{3}{2} \frac{V_z}{A} = \frac{3}{2} \frac{6000}{3.6} = 2500 \text{ psi}$$
PROBLEM 8.51 (Continued)

\[ \sigma_{\text{ave}} = -\frac{2644}{2} = -1322 \text{ psi} \]

\[ R = \sqrt{\left(\frac{2644}{2}\right)^2 + (2500)^2} = 2828 \text{ psi} \]

\[ \sigma_a = \sigma_{\text{ave}} + R \]
\[ \sigma_a = 1506 \text{ psi} \]

\[ \sigma_b = \sigma_{\text{ave}} - R \]
\[ \sigma_b = -4150 \text{ psi} \]

\[ \tan 2\theta_p = \frac{2\tau_{\text{max}}}{|\sigma_{\text{II}}|} = \frac{(2)(2500)}{2644} = 1.891 \]

\[ \theta_a = 31.1^\circ, \quad \theta_b = 121.1^\circ \]

$$M_x = (1.8)(25) = 45 \text{ kN} \cdot \text{m}$$
$$M_y = -(1.2)(24) = -28.8 \text{ kN} \cdot \text{m}$$
$$V_x = -24 \text{ kN}, \quad V_y = -25 \text{ kN}$$

For W310 $\times$ 60 rolled steel section,

$$d = 302 \text{ mm}, \quad b_f = 203 \text{ mm}, \quad t_f = 13.1 \text{ mm}, \quad t_w = 7.49 \text{ mm}$$
$$I_x = 128 \times 10^6 \text{ mm}^4 = 128 \times 10^{-6} \text{ m}^4, \quad I_y = 18.4 \times 10^6 \text{ mm}^4 = 18.4 \times 10^{-6} \text{ m}^4$$

Normal stress at point $b$: $x = 0, \quad y = -\frac{1}{2}d + t_f = -137.9 \text{ mm}$

$$\sigma_z = \frac{M_y y}{I_x} - \frac{M_x x}{I_y} = \frac{(45 \times 10^3)(-137.9 \times 10^{-3})}{128 \times 10^{-6}} = 48.480 \text{ MPa}$$

Shearing stress at point $b$:

$$\tau_{yz} = -\frac{V_x A^* \bar{y}}{I_x t_w}$$

$$A^* = A_f = b_f t_f = 2659.3 \text{ mm}^2 = 2659.3 \times 10^{-6} \text{ m}^2$$
$$\bar{x} = 0, \quad \bar{y} = -\frac{1}{2}d + \frac{1}{2}t_f = -144.45 \text{ mm}$$

$$\tau_{yz} = -\frac{(-25 \times 10^3)(2659.3 \times 10^{-6})(-144.45 \times 10^{-3})}{(128 \times 10^{-6})(7.49 \times 10^{-3})} = -10.0169 \text{ MPa}$$
\[
\sigma_{\text{ave}} = \frac{-48.480}{2} = -24.240 \, \text{MPa}

\[
R = \sqrt{\left(\frac{48.48}{2}\right)^2 + (10.0169)^2} = 26.228 \, \text{MPa}

PROBLEM 8.59

A vertical force $P$ is applied at the center of the free end of cantilever beam $AB$. (a) If the beam is installed with the web vertical ($\beta = 0$) and with its longitudinal axis $AB$ horizontal, determine the magnitude of the force $P$ for which the normal stress at point $a$ is $+120$ MPa.  

(b) Solve part (a), assuming that the beam is installed with $\beta = 3^\circ$.

SOLUTION

For W250 $\times$ 44.8 rolled steel section,

$S_x = 531 \times 10^3 \text{ mm}^3 = 531 \times 10^{-6} \text{ m}^3$

$S_y = 94.2 \times 10^3 \text{ mm}^3 = 94.2 \times 10^{-6} \text{ m}^3$

At the section containing point $a$,

$M_x = Pl \cos \beta, \quad M_y = Pl \sin \beta$

Stress at $a$:

$\sigma = \frac{M_x}{S_x} + \frac{M_y}{S_y} = \frac{Pl \cos \beta}{S_x} + \frac{Pl \sin \beta}{S_y}$

Allowable load.

$P_{all} = \frac{\sigma_{all}}{l} \left[ \frac{\cos \beta}{S_x} + \frac{\sin \beta}{S_y} \right]^{-1}$

(a) $\beta = 0$:

$P_{all} = \frac{120 \times 10^6}{1.25} \left[ \frac{1}{531 \times 10^{-6}} + 0 \right]^{-1} = 51.0 \times 10^3 \text{ N}$

$P_{all} = 51.0 \text{ kN} \uparrow$

(b) $\beta = 3^\circ$:

$P_{all} = \frac{120 \times 10^6}{1.25} \left[ \frac{\cos 3^\circ}{531 \times 10^{-6}} + \frac{\sin 3^\circ}{94.2 \times 10^{-6}} \right]^{-1} = 39.4 \times 10^3 \text{ N}$

$P_{all} = 39.4 \text{ kN} \uparrow$

PROBLEM 8.60

A force $P$ is applied to a cantilever beam by means of a cable attached to a bolt located at the center of the free end of the beam. Knowing that $P$ acts in a direction perpendicular to the longitudinal axis of the beam, determine (a) the normal stress at point $a$ in terms of $P$, $b$, $h$, $l$, and $\beta$, (b) the values of $\beta$ for which the normal stress at $a$ is zero.

SOLUTION

\[
I_x = \frac{1}{12}bh^3 \quad I_y = \frac{1}{12}hb^3
\]

\[
\sigma = \frac{M_x(h/2)}{I_x} - \frac{M_y(b/2)}{I_y}
\]

\[
= \frac{6M_x}{bh^2} - \frac{6M_y}{hb^2}
\]

\[
P = P\sin\beta \mathbf{i} - P\cos\beta \mathbf{j} \quad \mathbf{r} = lk
\]

\[
M = \mathbf{r} \times P = lk \times (P\sin\beta \mathbf{i} - P\cos\beta \mathbf{j})
\]

\[
= Pl\cos\beta \mathbf{i} + Pl\sin\beta \mathbf{j}
\]

\[
M_x = Pl\cos\beta \quad M_y = Pl\sin\beta
\]

(a) \[
\sigma = \frac{6Pl\cos\beta}{bh^2} - \frac{6Pl\sin\beta}{hb^2} = \frac{6Pl}{bh} \left[ \frac{\cos\beta}{h} - \frac{\sin\beta}{b} \right]
\]

(b) \[
\sigma = 0 \quad \frac{\cos\beta}{h} - \frac{\sin\beta}{b} = 0 \quad \tan\beta = \frac{b}{h}
\]

\[
\beta = \tan^{-1} \left( \frac{b}{h} \right)
\]
PROBLEM 8.61*

A 5-kN force $P$ is applied to a wire that is wrapped around bar $AB$ as shown. Knowing that the cross section of the bar is a square of side $d = 40$ mm, determine the principal stresses and the maximum shearing stress at point $a$.

SOLUTION

Bending: Point $a$ lies on the neutral axis.

$$\sigma = 0$$

Torsion: \[ \tau = \frac{T}{c_1 ab^2} \] where $a = b = d$

and \[ c_1 = 0.208 \] for a square section.

Since \[ T = \frac{P d}{2}, \quad \tau = \frac{P}{0.416 d^2} = 2.404 \frac{P}{d^2}. \]

Transverse shear:

$$V = P \quad I = \frac{1}{12} d^4$$

$$A = \frac{1}{2} d^2 \quad \bar{y} = \frac{1}{4} d \quad Q = A \bar{y} = \frac{1}{8} d^3$$

$$i = d$$

$$\tau_v = \frac{VQ}{It} = 1.5 \frac{P}{d^2}$$

By superposition,

$$\tau = \tau_T + \tau_v = 3.904 \frac{P}{d^2}$$

$$\tau = \frac{(3.904)(5 \times 10^3)}{(40 \times 10^{-3})^2}$$

$$= 12.2 \times 10^6 \text{Pa} \quad 12.2 \text{MPa}.$$

By Mohr’s circle,

$$\sigma_{\max} = 12.2 \text{ MPa} \uparrow$$

$$\sigma_{\min} = -12.2 \text{ MPa} \downarrow$$

$$\tau_{\max} = 12.2 \text{ MPa} \downarrow$$

PROBLEM 8.62*

Knowing that the structural tube shown has a uniform wall thickness of 0.3 in., determine the principal stresses, principal planes, and maximum shearing stress at (a) point $H$, (b) point $K$.

**SOLUTION**

At the section containing points $H$ and $K$,

$$
V = 9 \text{ kips} \quad M = (9)(10) = 90 \text{ kip} \cdot \text{in} \\
T = (9)(3 - 0.15) = 25.65 \text{ kip} \cdot \text{in}
$$

**Torsion:**

$$
\tau = \frac{T}{2\pi a} = \frac{25.65}{(2)(0.3)(21.09)} = 2.027 \text{ ksi}
$$

**Transverse shear:**

$$
Q_H = 0 \\
Q_K = (3)(2)(1) - (2.7)(1.7)(0.85) = 2.0985 \text{ in}^3 \\
I = \frac{1}{12}(6)(4)^3 - \frac{1}{12}(5.4)(3.4)^3 = 14.3132 \text{ in}^4 \\
\tau_H = 0 \quad \tau_K = \frac{VQ_H}{It} = \frac{(9)(2.0985)}{(14.3132)(0.3)} = 4.398 \text{ ksi}
$$

**Bending:**

$$
\sigma_H = \frac{Mc}{I} = \frac{(90)(2)}{14.3132} = 12.576 \text{ ksi}, \quad \sigma_K = 0
$$
PROBLEM 8.62* (Continued)

(a) Point $H$:

$\sigma_{ave} = \frac{12.576}{2} = 6.288 \text{ ksi}$

$R = \sqrt{\left(\frac{12.576}{2}\right)^2 + (2.027)^2} = 6.607 \text{ ksi}$

$\sigma_{max} = \sigma_{ave} + R$
$\sigma_{min} = \sigma_{ave} - R$

$\tan 2\theta_p = \frac{2\tau}{\sigma} = -0.3224$

$\tau_{max} = R = 6.61 \text{ ksi}$

(b) Point $K$:

$\sigma = 0 \quad \tau = 2.027 + 4.398 = 6.425 \text{ ksi}$

$\sigma_{max} = 12.90 \text{ ksi}$
$\sigma_{min} = -0.32 \text{ ksi}$
$\theta_p = -8.9^\circ, 81.1^\circ$

$\sigma_{max} = 6.43 \text{ ksi}$
$\sigma_{min} = -6.43 \text{ ksi}$
$\theta = \pm 45^\circ$

$\tau_{max} = 6.43 \text{ ksi}$
PROBLEM 8.63*

The structural tube shown has a uniform wall thickness of 0.3 in. Knowing that the 15-kip load is applied 0.15 in. above the base of the tube, determine the shearing stress at (a) point a, (b) point b.

SOLUTION

Calculate forces and couples at section containing points a and b.

\[ V_x = 15 \text{ kips} \]
\[ M_z = (2 - 0.15)(15) = 27.75 \text{ kip} \cdot \text{in} \]
\[ M_y = (10)(15) = 150 \text{ kip} \cdot \text{in} \]

Shearing stresses due to torque \( T = M_z \):

\[ sA = [3 - (2)(0.15)][4 - (2)(0.15)] = 9.99 \text{ in}^2 \]
\[ q = \frac{M_z}{2sA} = \frac{27.75}{(2)(9.99)} = 1.3889 \text{ kip/in} \]

At point a, \( t = 0.3 \text{ in.} \) \( \tau_a = \frac{q}{t} = \frac{1.3889}{0.3} = 4.630 \text{ ksi} \)
At point b, \( t = 0.3 \text{ in.} \) \( \tau_b = \frac{q}{t} = \frac{1.3889}{0.3} = 4.630 \text{ ksi} \)
PROBLEM 8.63* (Continued)

Shearing stresses due to $V_x$:

At point $a$,

1 & 0.45 & -0.75 & -0.3375 \\
2 & 1.02 & -1.35 & -1.377 \\
3 & 0.45 & -0.75 & -0.3375 \\
\hline
\Sigma & & & -2.052 \\
\end{array}
\]

\[Q = [\Sigma A\bar{x}] = 2.052 \text{ in}^3\]

\[t = (2)(0.3) = 0.6 \text{ in.}\]

\[I_y = \frac{1}{12}(4)(3)^3 - \frac{1}{12}(3.4)(2.4)^3 = 5.0832\]

\[\tau = \frac{V_i Q}{I_y t} = \frac{(15)(2.052)}{(5.0832)(0.6)} = 10.092 \text{ ksi}\]

At point $b$,

\[\tau_b = 0\]

Combined shearing stresses,

(a) At point $a$,

\[\tau_a = 4.630 \leftrightarrow +10.092 \rightarrow = 5.46 \text{ ksi} \rightarrow \tau_a = 5.46 \text{ ksi} \uparrow\]

(b) At point $b$,

\[\tau_b = 4.630 \uparrow + 0 = 4.63 \text{ ksi} \uparrow \quad \tau_b = 4.63 \text{ ksi} \uparrow\]

**Forces**

\[
I_y = \frac{1}{12}(4)(3)^3 - \frac{1}{12}(3.4)(2.4)^3 = 5.0832 \text{ in}^4

\[
sd = [3 - (2)(0.15)][4 - (2)(0.15)] = 9.99 \text{ in}^2

\[ R_A = R_C = \frac{1}{2} P \]

\[ = 3.75 \times 10^3 \text{N} \]

\[ M_B = (3.75 \times 10^3)(150 \times 10^{-3}) \]

\[ = 562.5 \text{ N} \cdot \text{m} \]

PROBLEM 8.67

Using the notation of Sec. 8.3 and neglecting the effect of shearing stresses caused by transverse loads, show that the maximum normal stress in a circular shaft can be expressed as follows:

\[
\sigma_{\text{max}} = \frac{c}{J} \left[ \left( M_y^2 + M_z^2 \right)^{1/2} + \left( M_y^2 + M_z^2 + T^2 \right)^{1/2} \right]_{\text{max}}
\]

SOLUTION

Maximum bending stress:

\[
\sigma_m = \frac{|M|c}{I} = \frac{\sqrt{M_y^2 + M_z^2 c}}{I}
\]

Maximum torsional stress:

\[
\tau_m = \frac{Tc}{J}
\]

\[
\sigma_m = \frac{\sqrt{M_y^2 + M_z^2 c}}{2I} = \frac{c}{J} \sqrt{M_y^2 + M_z^2}
\]

Using Mohr’s circle,

\[
R = \sqrt{\left( \frac{\sigma_m}{2} \right)^2 + \tau_m^2} = \sqrt{\frac{c^2}{J^2} \left( M_y^2 + M_z^2 \right) + \frac{T^2 c^2}{J^2}} = \frac{c}{J} \sqrt{M_y^2 + M_z^2 + T^2}

\[
\sigma_{\text{max}} = \frac{\sigma_m}{2} + R = \frac{c}{J} \sqrt{M_y^2 + M_z^2} + \frac{c}{J} \sqrt{M_y^2 + M_z^2 + T^2} = \frac{c}{J} \left[ \left( M_y^2 + M_z^2 \right)^{1/2} + \left( M_y^2 + M_z^2 + T^2 \right)^{1/2} \right]

Knowing that $\tau_{\text{all}} = 55$ MPa and assuming that 8 kW is taken off at gear $F$ and 12 kW is taken off at gear $G$, determine the smallest permissible diameter of shaft $AB$.

SOLUTION

$$f = \frac{450}{60} = 7.5 \text{ Hz}$$

Torque applied at $D$:

$$T_D = \frac{P}{2\pi f} = \frac{20 \times 10^3}{(2\pi)(7.5)} = 424.41 \text{ N} \cdot \text{m}$$

**SOLUTION**

\[ c_0 = \frac{d_i}{2} = 21 \text{ mm}, \quad c_t = \frac{d_i}{2} = 17.5 \text{ mm} \quad A = \pi (c_0^2 - c_t^2) = 423.33 \text{ mm}^2 \]

\[ J = \frac{\pi}{2} (c_0^4 - c_t^4) = 158.166 \times 10^3 \text{ mm}^4 \quad I = \frac{1}{2} J = 79.083 \times 10^3 \text{ mm}^4 \]

For semicircle with semicircular cutout,

\[ Q = \frac{2}{3} (c_0^3 - c_t^3) = 2.6011 \times 10^3 \text{ mm}^3 \]

At the section containing points $a$ and $b$,

\[ M_z = -(45 \times 10^{-3})(1500) = -67.5 \text{ N} \cdot \text{m} \]

\[ M_x = -(75 \times 10^{-3})(1200) = -90 \text{ N} \cdot \text{m} \]

PROBLEM 8.71

A close-coiled spring is made of a circular wire of radius \( r \) that is formed into a helix of radius \( R \). Determine the maximum shearing stress produced by the two equal and opposite forces \( P \) and \( P' \).

(Hint: First determine the shear \( V \) and the torque \( T \) in a transverse cross section.)

SOLUTION

\[ + \sum F_y = 0: \quad P - V = 0 \quad V = P \]
\[ + \sum M_c = 0: \quad T - PR = 0 \quad T = PR \]

Shearing stress due to \( T \):

\[ \tau_T = \frac{Tc}{J} = \frac{2T}{\pi c^3} = \frac{2PR}{\pi r^3} \]

Shearing stress due to \( V \):

For semicircle,

\[ Q = \frac{2}{3} r^3, \quad t = d = 2r \]

For solid circular section,

\[ I = \frac{1}{2} J = \frac{\pi}{4} r^3 \]

\[ \tau_V = \frac{VQ}{lt} = \frac{V \left( \frac{2}{3} r^3 \right)}{\frac{\pi}{4} r^4(2r)} = \frac{4V}{3\pi r^2} = \frac{4P}{3\pi r^2} \]

By superposition,

\[ \tau_{\text{max}} = \tau_T + \tau_V \]

\[ \tau_{\text{max}} = \frac{P(2R + 4r/3)}{\pi r^3} \]

Three forces are applied to a 4-in.-diameter plate that is attached to the solid 1.8-in. diameter shaft AB. At point H, determine (a) the principal stresses and principal planes, (b) the maximum shearing stress.

SOLUTION

At the section containing point H,

\[ P = 12 \text{ kips (compression)} \]
\[ V = 2.5 \text{ kips} \]
\[ T = (2)(2.5) = 5 \text{ kip \cdot in} \]
\[ M = (8)(2.5) = 20 \text{ kip \cdot in} \]
\[ d = 1.8 \text{ in.} \quad c = \frac{1}{2}d = 0.9 \text{ in.} \]
\[ A = \pi c^2 = 2.545 \text{ in}^2 \]
\[ I = \frac{\pi}{4} c^4 = 0.5153 \text{ in}^4 \]
\[ J = 2I = 1.0306 \text{ in}^4 \]

For a semicircle,
\[ Q = \frac{2}{3} c^3 = 0.486 \text{ in}^3 \]

Point H lies on neutral axis of bending.

\[ \sigma_H = \frac{P}{A} = \frac{12}{2.545} = -4.715 \text{ ksi} \]
\[ \tau_H = \frac{Tc}{J} + \frac{VQ}{Jt} = \frac{(5)(0.9)}{1.0306} + \frac{(2.5)(0.486)}{(0.5153)(1.8)} \]

Knowing that the bracket \( AB \) has a uniform thickness of \( \frac{5}{8} \) in, determine \((a)\) the principal planes and principal stresses at point \( K \), \((b)\) the maximum shearing stress at point \( K \).

SOLUTION

Resolve the 3 kip force \( F \) at point \( A \) into \( x \) and \( y \) components.

Shearing stresses.

Point $a$ is an outside corner.

At point $b$,

$$Q_{zb} = (1.5)(0.25)(2.875) = 1.0781 \text{ in}^3$$

$$\tau_{b,xy} = \frac{V_x Q_{zb}}{I_t} = \frac{3(1.0781)}{(19.3385)(0.25)} = 0.669 \text{ ksi}$$

At point $c$,

$$Q_{zc} = Q_{zb} + (2.75)(0.25) \left( \frac{2.75}{2} \right) = 2.0234 \text{ in}^3$$

$$\tau_{c,xy} = \frac{V_x Q_{zc}}{I_t} = \frac{3(2.0234)}{(19.3385)(0.25)} = 1.256 \text{ ksi}$$

At point $b$,

SOLUTION

Use symmetry boundary conditions at $C$.

Using free body $ACB$ and symmetry,

$$R_A = R_B = \frac{1}{4} w_0 L$$

For $0 < x < \frac{L}{2}$, $w = \frac{2w_0 x}{L}$

$$\frac{dV}{dx} = -w = -\frac{2w_0 x}{L}$$
$$\frac{dM}{dx} = V = -\frac{w_0 x^2}{L} + R_A = \frac{w_0}{L} \left( \frac{1}{4} L^2 - x^2 \right)$$
$$M = \frac{w_0}{L} \left( \frac{1}{4} L^2 x - \frac{1}{3} x^3 \right) + C_M$$

PROBLEM 9.13

For the beam and loading shown, determine the deflection at point C. Use $E = 29 \times 10^6$ psi.

\[ [x = 0, \ y = 0] \quad [x = L, \ y = 0] \quad [x = a, \ y = y] \quad \begin{bmatrix} x = a, \ \frac{dy}{dx} = \frac{dy}{dx} \end{bmatrix} \]

SOLUTION

Let $b = L - a$.

Reactions:

\[ R_A = \frac{Pb}{L} \uparrow, \quad R_B = \frac{Pa}{L} \uparrow \]

Bending moments:

\[ 0 < x < a: \quad M = \frac{Pb}{L}x \]

\[ a < x < L: \quad M = \frac{P}{L}[bx - L(x - a)] \]

\[ EI \frac{d^2y}{dx^2} = \frac{P}{L}(bx) \]

\[ EI \frac{dy}{dx} = \frac{P}{L}\left(\frac{1}{2}bx^2\right) + C_1 \quad \text{Eq. (1)} \]

\[ EIy = \frac{P}{L}\left(\frac{1}{6}bx^3\right) + C_1x + C_2 \quad \text{Eq. (2)} \]

\[ 0 < x < a \quad \text{Eq. (2)} \quad 0 = 0 + 0 + C_2 \quad C_2 = 0 \]

\[ [x = a, \ y = y] \quad \text{Eqs. (1) and (3)} \quad \frac{P}{L}\left(\frac{1}{2}ba^2\right) + C_1 = \frac{P}{L}\left[\frac{1}{2}ba^2 + 0\right] + C_3 \quad \therefore \quad C_3 = C_1 \]

\[ [x = a, \ y = y] \quad \text{Eqs. (2) and (4)} \quad \frac{P}{L}\left(\frac{1}{6}ba^3\right) + C_1a + C_2 = \frac{P}{L}\left[\frac{1}{6}ba^3 + 0\right] + C_3a + C_4 \quad C_4 = C_2 = 0 \]
PROBLEM 9.13 (Continued)

\[ [x = L, \ y = 0 \quad \text{Eq. (4)}: \quad \frac{P}{L} \left[ \frac{1}{6} b L^3 - \frac{1}{6} L(L - a)^3 \right] + C_y L = 0 \]

\[ C_1 = C_3 = \frac{P}{L} \left[ \frac{1}{6} (L - a)^3 - \frac{1}{6} b L^2 \right] = \frac{P}{L} \left( \frac{1}{6} b^3 - \frac{1}{6} b L^2 \right) \]

Make \( x = a \) in Eq. (2).

\[ y_C = \frac{P}{E I L} \left[ \frac{1}{6} b a^3 + \frac{1}{6} b^3 a - \frac{1}{6} b L^2 a \right] = \frac{P(ba^3 + b^3 a - L^2 ab)}{6E I L} \]

Data:
\[ P = 35 \text{ kips}, \quad E = 29 \times 10^6 \text{psi} \]
\[ L = 15 \text{ ft}, \quad a = 5 \text{ ft}, \quad b = 10 \text{ ft} \]
\[ I = 291 \text{ in}^4, \quad EI = 8.439 \times 10^6 \text{ kip} \cdot \text{in}^2 \]
\[ = 58.604 \times 10^3 \text{ kip} \cdot \text{ft}^2 \]

\[ y_C = \frac{35}{(6)(58.604 \times 10^3)(15)} [(10)(5)^3 + (10)^3(5) - (15)^2(5)(10)] \]
\[ = -33.179 \times 10^{-3} \text{ ft} = -0.398 \text{ in.} \]

\[ y_C = 0.398 \text{ in.} \]

SOLUTION

Using ACB as a free body and noting that \( L = 3a \),

\[ \sum M_A = 0: \quad R_B L - (wa) \left( \frac{a}{2} \right) = 0 \]

\[ R_B = (wa) \frac{a}{2L} = \frac{1}{6} wa \]

\[ 0 \leq x \leq a \]

\[ \sum M_f = 0: \quad M - R_A x + (wx) \left( \frac{x}{2} \right) = 0 \]

\[ M = R_B x - \frac{1}{2} wx^2 \]

\[ Ely = \frac{1}{6} R_A x^3 - \frac{1}{24} wx^4 + C_1 x + C_2 \]

\[ Ely = \frac{1}{6} R_A x^3 - \frac{1}{24} wx^4 + C_1 x \]

\[ EI \frac{dy}{dx} = \frac{1}{2} R_A x^2 - \frac{1}{6} wx^3 + C_1 \]

\[ \leq x \leq L \]

\[ \sum M_K = 0: \quad -M + R_B (L - x) = 0 \]

\[ M = R_B (L - x) \]

\[ EI \frac{d^2y}{dx^2} = R_B (L - x) \]

\[ EI \frac{dy}{dx} = -\frac{1}{2} R_B (L - x)^2 + C_3 \]

\[ Ely = \frac{1}{6} R_B (L - x)^3 + C_3 x + C_4 \]

\[ x = L, \ y = 0 \] \quad \[ 0 = 0 + C_3 L + C_4 \quad C_4 = -C_3 L \]

PROBLEM 9.59

For the beam and loading of Prob. 9.45, determine the magnitude and location of the largest downward deflection.

SOLUTION

See solution to Prob. 9.45 for the derivation of the equations used in the following:

\[
EI = EI = 1366 \text{ kN} \cdot \text{m}^2
\]

\[
EI \frac{dy}{dx} = 4.9x^2 - 2(x - 0.4)^3 + 2(x - 1.2)^3 - 10(x - 1.2)^2 - 3.4080 \text{ kN} \cdot \text{m}^2
\]

\[
Ely = 1.63333x^3 - \frac{1}{2}(x - 0.4)^4 + \frac{1}{2}(x - 1.2)^4 - \frac{10}{3}(x - 1.2)^3 - 3.4080x \text{ kN} \cdot \text{m}^3
\]

To find the location of maximum \( |y| \), set \( \frac{dy}{dx} = 0 \). Assume \( 0.4 < x < 1.2 \).

\[
4.9x^2 - 2(x - 0.4)^3 - 3.4080 = f(x) = 0
\]

Solve by iteration:

\[
\begin{align*}
x &= 0.8 & 0.858 & 0.857 & 0.8570 \\
df/dx &= 6.88 & 7.123 & 7.145
\end{align*}
\]

\[x_m = 0.8570 \text{ m} \]

\[
Ely_m = (1.63333)(0.8570)^3 - \frac{1}{2}(0.8570 - 0.4)^4 - (3.4080)(0.8570)
\]

\[
= -1.9144 \text{ kN} \cdot \text{m}
\]

\[
y_m = \frac{1.9144}{1366} = -1.401 \times 10^{-3} \text{ m}
\]

\[y_m = 1.401 \text{ mm} \]
PROBLEM 9.60

For the beam and loading of Prob. 9.46, determine the magnitude and location of the largest downward deflection.

SOLUTION

See solution to Prob. 9.46 for the derivation of following:

\[ EI = 152,650 \text{ kip} \cdot \text{ft}^2 \]
\[ EI \frac{dy}{dx} = 9.422 x^2 - 0.5 (x - 5)^3 - 10 (x - 10)^2 - 644.7 \quad \text{kip} \cdot \text{ft}^2 \]
\[ EIy = 3.141x^3 - 0.125(x - 5)^4 - 3.333(x - 10)^3 - 644.7x \quad \text{kip} \cdot \text{ft}^3 \]

To find the location of maximum \( y \), set \( \frac{dy}{dx} = 0 \).

Assume \( 5 \leq x < 10 \).

\[ EI \frac{dy}{dx} = 9.422x^2 - 0.5(x - 5)^3 - 644.7 = f(x) = 0 \quad (1) \]
\[ \frac{df}{dx} = 18.844x - 1.5(x - 5)^2 \]

Solve Eq. (1) by iteration:
\[ x_{i+1} = x_i - \frac{f}{df/dx} \]

\( x = 9 \) \quad 8.406 \quad 8.397 \quad x_m = 8.40 \text{ ft} \n
\( f = 86.48 \) \quad 1.310 \quad 0.0415 \n
\( df/dx = 145.6 \) \quad 141.0 

\[ El_{y_m} = (3.141)(8.397)^3 - (0.125)(8.397 - 5)^4 - (644.7)(8.397) = -3570.5 \text{ kip} \cdot \text{ft}^3 \]

\[ 152,650 \ y_m = -3570.5 \quad y_m = -0.02339 \text{ ft} \]
\[ y_m = 0.281 \text{ in.} \]
PROBLEM 9.61

For the beam and loading of Prob. 9.47, determine the magnitude and location of the largest downward deflection.

SOLUTION

See solution to Prob. 9.47 for the derivation of the equations used in the following:

\[ EI = 1024 \text{ kN} \cdot \text{m}^2 \]

\[ EI \frac{dy}{dx} = 12x^2 - 8x^3 + 2x^4 - 2(x - 1)^4 - 4(x - 1)^2 - \frac{83}{15} \text{ kN} \cdot \text{m}^2 \]

\[ Ely = 4x^3 - 2x^4 + \frac{2}{5}x^5 - \frac{2}{5}(x - 1)^5 - \frac{4}{3}(x - 1)^3 - \frac{83}{15}x \text{ kN} \cdot \text{m}^3 \]

To find location of maximum \( |y| \), set \( \frac{dy}{dx} = 0 \). Assume \( 0 < x < 1 \) m.

\[ EI \frac{dy}{dx} = 12x^2 - 8x^3 + 2x^4 - \frac{83}{15} = 0 \]

Solving:

\[ x = 0.94166 \text{ m} \]

\[ x_m = 0.942 \text{ m} \]

\[ Ely_m = 4(0.94166)^3 - 2(0.94166)^4 + \frac{2}{5}(0.94166)^5 - \frac{83}{15}(0.94166) \]

\[ = -3.1469 \text{ kN} \cdot \text{m}^3 \]

\[ y_m = \frac{-3.1469}{1024} = -3.0731 \times 10^{-3} \text{ m} \]

\[ y_m = 3.07 \text{ mm} \]
PROBLEM 9.62

For the beam and loading of Prob. 9.48, determine the magnitude and location of the largest downward deflection.

SOLUTION

See solution to Prob. 9.48 for the derivation of the equations used in the following:

\[ EI = 539.18 \text{ kip} \cdot \text{ft}^2 \]

\[ EI \frac{dy}{dx} = 0.903125x^2 - l(x - 1.75)^2 - 0.05833(x - 3.5)^2 - 7.54779 \text{ kip} \cdot \text{ft}^2 \]

\[ ELy = 0.301042x^3 - \frac{1}{3}(x - 1.75)^3 - 0.014583(x - 3.5)^4 - 7.54779x \text{ kip} \cdot \text{ft}^3 \]

To find the location of maximum \( |y| \), set \( \frac{dy}{dx} = 0 \). Assume \( 1.75 < x_m < 3.5 \).

\[
0.903125x_m^2 - l(x_m - 1.75)^2 - 7.54779 = 0
\]

\[
0.096875x_m^2 - 8.5x_m + 10.61029 = 0
\]

\[
x_m = \frac{3.5 - \sqrt{(3.5)^2 - (4)(0.096875)(10.61029)}}{(2)(0.096875)}
\]

\[ x_m = 3.34 \text{ ft} \]

\[
E Ly_m = (0.301042)(3.340)^3 - \frac{1}{3}(3.340 - 1.73)^3 - (7.54779)(3.340)
\]

\[ = -15.3328 \text{ kip} \cdot \text{ft}^3 \]

\[
y_m = -\frac{15.3328}{539.18} = -12.44 \times 10^{-3} \text{ ft}
\]

\[ y_m = 0.341 \text{ in.} \]

PROBLEM 9.63

The rigid bars $BF$ and $DH$ are welded to the rolled-steel beam $AE$ as shown. Determine for the loading shown (a) the deflection at point $B$, (b) the deflection at midpoint $C$ of the beam. Use $E = 200 \text{ GPa}$. 

SOLUTION

Use joint $G$ as a free body,

By symmetry, $F_{GH} = F_{FG}$

$+\sum F_y = 0$: $2F_{GHx} - 100 = 0 \quad F_{GHx} = 50 \text{ kN}$

$F_{GHy} = 2F_{GHy} = 100 \text{ kN}.$

Forces in kN; lengths in m.

$V = 50 - 50(x - 0.5)^0 - 50(x - 1.1)^0 \quad \text{kN}$

$M = 50x - 50(x - 0.5)^1 - 50(x - 1.1)^0$

$\quad +40(x - 0.5)^0 - 40(x - 1.1)^0 \quad \text{kN} \cdot \text{m}$

$EI \frac{dy}{dx} = 25x^2 - 25(x - 0.5)^2 - 25(x - 1.1)^2 - 40(x - 0.5)^1 + 40(x - 1.1)^1 + C_1 \quad \text{kN} \cdot \text{m}^2$

$EIy = \frac{25}{3}x^3 - \frac{25}{3}(x - 0.5)^3 - \frac{25}{3}(x - 1.1)^3 - 20(x - 0.5)^2 + 20(x - 1.1)^2 + C_1x + C_2 \quad \text{kN} \cdot \text{m}^3$

$[x = 0, \quad y = 0] \quad C_2 = 0$

$[x = 1.6, \quad y = 0]$

$\left(\frac{25}{3}\right)(1.6)^3 - \left(\frac{25}{3}\right)(1.1)^3 - \left(\frac{25}{3}\right)(0.5)^3 - (20)(1.1)^2 + (20)(0.5)^2 + C_1(1.6) + 0 = 0$

$C_1 = -1.75 \text{ kN} \cdot \text{m}^3$

For $EIy_B$,

$x = 0.5 \text{ m}$

$EIy_B = \left(\frac{25}{3}\right)(0.5)^3 - 0 - 0 - 0 - (1.75)(0.5) = 0.1667 \text{ kN} \cdot \text{m}^3$

For $EIy_C$,

$x = 0.8 \text{ m}$

$EIy_C = \left(\frac{25}{3}\right)(0.8)^3 - \left(\frac{25}{3}\right)(0.3)^3 - 0 - (20)(0.3)^2 - 0 - (1.75)(0.8) + 0$

$= -0.8417 \text{ kN} \cdot \text{m}^3$
PROBLEM 9.63 (Continued)

For W 100 × 19.3 rolled-steel shape, \( I = 4.70 \times 10^6 \text{ mm}^4 = 4.70 \times 10^{-6} \text{ m}^4 \)

\[
EI = (200 \times 10^3)(4.70 \times 10^{-6}) = 940 \times 10^3 \text{ N} \cdot \text{ m}^2 = 940 \text{ kN} \cdot \text{ m}^2
\]

(a) \( y_B = \frac{0.1667}{940} = 0.177 \times 10^{-3} \text{ m} \)

\( y_B = 0.177 \text{ mm} \uparrow \)

(b) \( y_C = \frac{0.8417}{940} = 0.895 \times 10^{-3} \text{ m} \)

\( y_C = 0.895 \text{ mm} \uparrow \)
PROBLEM 9.64

The rigid bar DEF is welded at point D to the rolled-steel beam AB. For the loading shown, determine (a) the slope at point A, (b) the deflection at midpoint C of the beam. Use $E = 200$ GPa.

SOLUTION

Units: Forces in kN; lengths in meters.

$M_B = 0: \quad -4.8R_A + (30)(2.4)(3.6) + (50)(2.4) = 0 \quad \Rightarrow \quad R_A = 79$ kN ↑

$I = 212 \times 10^6$ mm$^4 = 212 \times 10^{-6}$ m$^4$

$EI = (200 \times 10^9)(212 \times 10^{-6}) = 42.4 \times 10^6$ N · m$^2 = 42400$ kN · m$^2$

$w(x) = 30 - 30(x - 2.4)^0$

$\frac{dV}{dx} = -w = -30 + 30(x - 2.4)^0 \quad \text{kN/m}$

$\frac{dM}{dx} = V = 79 - 30x + 30(x - 2.4)^1 - 50(x - 3.6)^0 \quad \text{kN}$

$EI \frac{d^2y}{dx^2} = M = 79x - 15x^2 + 15(x - 2.4)^2 - 50(x - 3.6)^1 - 60(x - 3.6)^0 \quad \text{kN · m}$

$EI \frac{dy}{dx} = \frac{79}{2} x^2 - 5x^3 + 5(x - 2.4)^3 - 25(x - 3.6)^2 - 60(x - 3.6)^1 + C_1 \quad \text{kN · m}^2$

$ELy = \frac{79}{6} x^3 - \frac{5}{4} x^4 + \frac{5}{4}(x - 2.4)^4 - \frac{25}{3}(x - 3.6)^3 - 30(x - 3.6)^2 + C_1x + C_2 \quad \text{kN · m}^3$

$[x = 0, y = 0] \quad 0 - 0 + 0 - 0 + 0 + 0 + C_2 = 0 \quad \Rightarrow \quad C_2 = 0$

$[x = 4.8, y = 0] \quad \left(\frac{79}{6}\right)(4.8)^3 - \left(\frac{5}{4}\right)(4.8)^4 + \left(\frac{5}{4}\right)(2.4)^4$

$- \left(\frac{25}{3}\right)(1.2)^3 - 30(1.2)^2 + 4.8C_1 = 0 \quad \Rightarrow \quad C_1 = -161.76$ kN · m$^2$
PROBLEM 9.64 (Continued)

(a) Slope at point A. \( \frac{dy}{dx} \) at \( x = 0 \)

\[
EI \left( \frac{dy}{dx} \right)_A = 0 - 0 - 0 - 0 - 161.76
\]

\[
= -161.76 \text{ kN} \cdot \text{m}^2
\]

\[
\left( \frac{dy}{dx} \right)_A = -\frac{161.76}{42400} = -3.82 \times 10^{-3}
\]

\( \theta_A = 3.82 \times 10^{-3} \text{ rad.} \)

(b) Deflection at midpoint C. \( y \) at \( x = 2.4 \)

\[
EIy_C = \left( \frac{79}{6} \right)(2.4)^3 - \left( \frac{5}{4} \right)(2.4)^4 + 0 - 0 - (161.76)(2.4) + 0

\[
= -247.68 \text{ kN} \cdot \text{m}^3

\[
y_C = -\frac{247.68}{42400} = -5.84 \times 10^{-3} \text{ m}

For the cantilever beam and loading shown, determine the slope and deflection at the free end.

SOLUTION

Loading I: Counterclockwise couple \( PL \) at \( B \).

Case 3 of Appendix \( D \) applied to portion \( BC \).

\[
\theta_B = -\frac{(PL)(L/2)}{EI} = \frac{1}{2} \frac{PL^2}{EI} \\
y'_B = \frac{(PL)(L/2)^2}{2EI} = \frac{1}{8} \frac{PL^3}{EI}
\]

\( AB \) remains straight.

\[
\theta_A = \theta_B = \frac{1}{2} \frac{PL^2}{EI} \\
y'_A = y'_B - \left( \frac{L}{2} \right) \theta_B = -\frac{1}{8} \frac{PL^3}{EI} - \frac{1}{4} \frac{PL^3}{EI} = -\frac{3}{8} \frac{PL^3}{EI}
\]

Loading II: Case 1 of Appendix \( D \).

\[
\theta'_A = \frac{PL^2}{2EI}, \quad y''_A = \frac{PL^3}{3EI}
\]

By superposition,

\[
\theta_A = \theta'_A + \theta''_A = \frac{1}{2} \frac{PL^2}{EI} + \frac{1}{2} \frac{PL^2}{EI} = \frac{1}{2} \frac{PL^2}{EI} \quad \theta_A = \frac{PL^2}{EI} \quad \uparrow

PROBLEM 9.66

For the cantilever beam and loading shown, determine the slope and deflection at the free end.

SOLUTION

Loading I:  \( P \) downward at \( B \).
Case 1 of Appendix D applied to portion \( AB \).

\[
\theta'_b = -\frac{P(L/2)^2}{2EI} = -\frac{1}{8} \frac{PL^2}{EI}
\]
\[
y'_b = -\frac{P(L/2)^3}{3EI} = -\frac{1}{24} \frac{PL^3}{EI}
\]

BC remains straight.

\[
\theta'_c = \theta'_b = -\frac{1}{8} \frac{PL^2}{EI}
\]
\[
y'_c = y'_b - \left(\frac{L}{2}\right) \theta'_b = -\frac{1}{24} \frac{PL^3}{EI} - \frac{1}{16} \frac{PL^3}{EI}
\]
\[
= -\frac{5}{48} \frac{PL^3}{EI}
\]

Loading II:  \( P \) downward at \( C \).
Case 1 of Appendix D.

\[
\theta'_c = -\frac{PL^2}{2EI} \quad y'_c = -\frac{PL^3}{3EI}
\]

By superposition,

\[
\theta_c = \theta'_c + \theta'_c = -\frac{1}{8} \frac{PL^2}{EI} - \frac{1}{2} \frac{PL^2}{EI} = -\frac{5}{8} \frac{PL^2}{EI}
\]
\[
y_c = y'_c + y'_c = -\frac{5}{48} \frac{PL^3}{EI} - \frac{1}{3} \frac{PL^3}{EI} = -\frac{21}{48} \frac{PL^3}{EI} = -\frac{7}{16} \frac{PL^3}{EI}
\]
PROBLEM 9.67

For the cantilever beam and loading shown, determine the slope and deflection at the end.

SOLUTION

**Loading I:** Uniformly distributed downward loading with
\[ w = \frac{P}{L} \]
Case 2 of Appendix D.

\[ \theta_C' = -\frac{(P/L) L^3}{6EI} = -\frac{1}{6} \frac{PL^2}{EI} \]

\[ y_C' = -\frac{(P/L) L^4}{8EI} = -\frac{1}{8} \frac{PL^3}{EI} \]

**Loading II:** Upward concentrated load at \( P \) at point \( B \).
Case 1 of Appendix D applied to portion \( AB \).

\[ \theta_B' = \frac{P(L/2)^2}{2EI} = \frac{1}{8} \frac{PL^2}{EI} \]

\[ y_B' = \frac{P(L/2)^3}{3EI} = \frac{1}{24} \frac{PL^3}{EI} \]

Portion \( BC \) remains straight.

\[ \theta_C'' = \theta_B'' = \frac{1}{8} \frac{PL^2}{EI} \]

\[ y_C'' = y_B'' + \frac{L}{2} \theta_B'' = \frac{1}{24} \frac{PL^3}{EI} + \frac{1}{16} \frac{PL^3}{EI} = \frac{5}{48} \frac{PL^3}{EI} \]

By superposition,

\[ \theta_C = \theta_C' + \theta_C'' = -\frac{1}{6} \frac{PL^2}{EI} + \frac{1}{8} \frac{PL^2}{EI} = -\frac{1}{24} \frac{PL^2}{EI} \]

\[ y_C = y_C' + y_C'' = -\frac{1}{8} \frac{PL^3}{EI} + \frac{5}{48} \frac{PL^3}{EI} = -\frac{1}{48} \frac{PL^3}{EI} \]
PROBLEM 9.68

For the cantilever beam and loading shown, determine the slope and deflection at the free end.

SOLUTION

Loading I: Downward distributed load $w$ applied to portion $AB$.

\]

Portion $BC$ remains straight.

\[
\theta_C = \theta_B' = -\frac{1}{48} \frac{wL^3}{EI} \\
y_C' = y_B' + \left(\frac{L}{2}\right) \theta_B' = -\frac{1}{128} \frac{wL^4}{EI} - \frac{1}{96} \frac{wL^4}{EI} = -\frac{7}{384} \frac{wL^4}{EI}

PROBLEM 9.69

For the beam and loading shown, determine (a) the deflection at C, (b) the slope at end A.

SOLUTION

**Loading I:** Downward load \( P \) at \( B \).
Use Case 5 of Appendix D with

\[
P = P, \quad a = \frac{L}{3}, \quad b = \frac{2L}{3}, \quad L = L, \quad x = \frac{2L}{3}
\]

For \( x < a \), given elastic curve is

\[
y = \frac{Pb}{EIL} \left[ x^3 - (L^2 - b^2)x \right]
\]

To obtain elastic curve for \( x > a \), replace \( x \) by \( L - x \) and interchange \( a \) and \( b \) to get

\[
y = \frac{Pa}{EIL} \left[ (L - x)^3 - (L^2 - a^2)(L - x) \right] \quad \text{with} \quad x = \frac{2L}{3} \quad \text{at point} \quad C.
\]

\[
y_C = \frac{P(L/3)}{EIL} \left[ \left( \frac{L}{3} \right)^3 - \left( L^2 - \left( \frac{L}{3} \right)^2 \right) \left( \frac{L}{3} \right) \right] = \frac{7}{486} \frac{PL^3}{EI}
\]

\[
\theta_A = \frac{Pb(L^2 - b^2)}{6EIL} = -\frac{P(2L/3)(L^2 - (2L/3)^2)}{6EIL} = -\frac{5}{81} \frac{PL^2}{EI}
\]

**Loading II:** Upward load at \( C \). Use Case 5 of Appendix D with

\[
P = -P, \quad a = \frac{2L}{3}, \quad b = \frac{L}{3}, \quad L = L, \quad x = a = \frac{2L}{3}
\]

\[
y_C = \frac{(-P)(2L/3)^2(L/3)^2}{3EIL} = \frac{4}{243} \frac{PL^3}{EI}
\]

\[
\theta_A = \frac{(-P)(L/3)(L^2 - (L/3)^2)}{6EIL} = \frac{4}{81} \frac{PL^2}{EI}
\]

(a) **Deflection at C.**

\[
y_C = \frac{7}{486} \frac{PL^3}{EI} + \frac{4}{243} \frac{PL^3}{EI} = \frac{1}{486} \frac{PL^3}{EI}
\]

(b) **Slope at A.**

\[
\theta_A = -\frac{5}{81} \frac{PL^2}{EI} + \frac{4}{81} \frac{PL^2}{EI} = \frac{1}{81} \frac{PL^2}{EI}
\]

**SOLUTION**

**Loading I:** Load at B. Case 5 of Appendix D.

\[
y = \frac{P_a}{6EI}[(L - x)^3 - (L^2 - a^2)(L - x)]

\]

\[
\theta_A = -\frac{Pb(L^2 - b^2)}{6EI} = -\frac{P(2L/3)(L^2 - 4L^2/9)}{6EI} = -\frac{5}{81} \frac{PL^2}{EI}

**Loading II:** Load at C. Case 5 of Appendix D.

\[
a = \frac{2L}{3}, \quad b = \frac{L}{3}, \quad x = \frac{2L}{3}

= -\frac{8}{486} \frac{PL^3}{EI}
\]

\[
\theta_A = -\frac{Pb(L^2 - b^2)}{6EI} = -\frac{P(L/3)(L^2 - L^2/9)}{6EI} = -\frac{4}{81} \frac{PL^2}{EI}
\]

(a) **Deflection at C.**

\[
y_C = -\frac{7}{486} \frac{PL^3}{EI} - \frac{8}{486} \frac{PL^3}{EI} = -\frac{15}{486} \frac{PL^3}{EI}
\]

\[
y_C = \frac{5}{162} \frac{PL^3}{EI}
\]

(b) **Slope at A.**

\[
\theta_A = -\frac{5}{81} \frac{PL^2}{EI} - \frac{4}{81} \frac{PL^2}{EI} = -\frac{1}{9} \frac{PL^2}{EI}
\]

\[
\theta_A = \frac{1}{9} \frac{PL^2}{EI}
\]

Portion $AB$ remains straight.

$$\theta_A' = \theta_B' = \frac{4.5}{EI}$$

$$y_A' = y_B' - a\theta_B' = -\frac{10.125}{EI} - (2)\left(\frac{4.5}{EI}\right) = -\frac{19.125}{EI}$$

PROBLEM 9.79

For the uniform beam shown, determine the reaction at each of the three supports.

SOLUTION

Consider $R_C$ as redundant and replace loading system by I and II.

Loading I: (Case 4 of Appendix D.) $y_C' = -\frac{R_C L^3}{48EI}$

Loading II: (Case 7 of Appendix D.)

$$= \frac{M_0 L^2}{16EI}$$

Superposition and constraint:

$$y_C = y_C' + y_C'' = 0$$

$$-\frac{R_C L^3}{48EI} + \frac{M_0 L^2}{16EI} = 0$$

Beam is indeterminate to first degree. Consider $R_C$ to be the redundant reaction, and replace the loading by loadings I, II, and III.

Loading I: Case 4 of Appendix D.

$$ (y_C)_I = \frac{R_C(2L)^3}{48EI} = \frac{1}{6} \frac{R_C l^3}{EI} $$

Loading II: Case 5 of Appendix D.

$$ (y_C)_II = \frac{Pb}{6EI(2L)}[x^3 - ((2L)^2 - b^2)x] $$

$$ = \frac{P(L/2)}{12EI} \left[ L^3 - \left\{ 4L^2 - \left( \frac{L}{2} \right)^2 \right\} L \right] = -\frac{11}{48} P L^3 $$

Loading III: Case 5 of Appendix D.

$$ (y_C)_III = 2(y_C)_II = \frac{11}{24} \frac{P L^3}{EI} $$

Superposition and constraint:

$$ y_C = (y_C)_I + (y_C)_II + (y_C)_III = 0 $$

$$ \frac{1}{6} \frac{R_C l^3}{EI} - \frac{11}{48} \frac{P L^3}{EI} - \frac{11}{24} \frac{P L^3}{EI} - \frac{11}{16} \frac{P L^3}{EI} = 0 $$

$$ R_C = \frac{33}{16} P \uparrow \triangle $$

Statics: $\sum M_E = 0$:

$$ -R_A(2L) + P \left( \frac{3L}{2} \right) - \left( \frac{33}{16} P \right) L + (2P) \left( \frac{L}{2} \right) = 0 $$

$$ R_A = \frac{7}{32} P \uparrow \triangle $$

$$ \sum F_y = 0: \frac{7}{32} P - P + \frac{33}{16} P - 2P + R_E = 0 $$

$$ R_E = \frac{23}{32} P \uparrow \triangle $$
**PROBLEM 9.81**

For the uniform beam shown, determine (a) the reaction at \( A \), (b) the reaction at \( B \).

**SOLUTION**

Beam is indeterminate to first degree. Consider \( R_A \) as redundant and replace the given loading by loadings I, II, and III.

**Loading I:** Case 1 of Appendix D.

\[
(v_A)_I = \frac{R_A L^3}{3EI}
\]

**Loading II:** Case 2 of Appendix D.

\[
(v_A)_II = -\frac{wL^4}{8EI}
\]

**Loading III:** Case 2 of Appendix D (portion \( CB \)).

\[
\theta_C)_{III} = -\frac{w(L/2)^3}{6EI} = -\frac{1}{48}\frac{wL^3}{EI}
\]

\[
(y_C)_{III} = \frac{w(L/2)^4}{8EI} = \frac{1}{128}\frac{wL^4}{EI}
\]

Portion \( AC \) remains straight.

\[
(y_A)_{III} = (y_C)_{III} + \frac{L}{2}(\theta_C)_{III} = \frac{7}{384}\frac{wL^4}{EI}
\]

Superposition and constraint: \( y_A = (y_A)_I + (y_A)_II + (y_A)_III = 0 \)

(a) \[
\frac{1}{3}\frac{R_A L^3}{EI} - \frac{1}{8}\frac{wL^4}{EI} + \frac{7}{384}\frac{wL^4}{EI} = \frac{1}{3}\frac{R_A L^3}{EI} - \frac{41}{384}\frac{wL^4}{EI} = 0
\]

\[ R_A = \frac{41}{128}wL \uparrow \]

Statics:

(b) \[
+\sum F_x = 0 : \quad \frac{41}{128}wL - \frac{1}{2}wL + R_B = 0
\]

\[ R_B = \frac{23}{128}wL \uparrow \]

\[
+\sum M_B = 0 : \quad -\left(\frac{41}{128}wL\right)L - \left(\frac{1}{2}wL\right)\left(\frac{3L}{4}\right) - M_B = 0
\]

\[ M_B = \frac{7}{128}wL^2 \]
PROBLEM 9.82

For the uniform beam shown, determine \((a)\) the reaction at \(A\), \((b)\) the reaction at \(B\).

SOLUTION

Consider \(R_A\) as redundant and replace loading system by I and II.

**Loading I:** (Case 1 of Appendix \(D\).) \[ y'_A = \frac{R_A L^3}{3EI} \]

**Loading II:** Portion \(BC\). (Case 3 of Appendix \(D\).) \[ y'_C = -\frac{M_0(L-a)^2}{2EI} \quad \theta'_C = \frac{M_0(L-a)}{EI} \]

Portion \(AC\) is straight. \[ y''_A = y'_C - (a)\theta'_C \]

\[ y''_A = -\frac{M_0(L-a)^2}{2EI} - \frac{aM_0(L-a)}{EI} \]

\((a)\) Superposition and constraint: \[ y_A = y'_A + y''_A = 0 \]

\[ \frac{R_A L^3}{3EI} - \frac{M_0(L-a)^2}{2EI} - \frac{aM_0(L-a)}{EI} = 0 \]

\[ \frac{2}{3} R_A L^3 - M_0(L-a)(L-a+2a) = 0 \]

\[ \frac{2}{3} R_A L^3 = M_0(L^2-a^2) \]

\[ R_A = \frac{3M_0}{2L^2}(L^2-a^2) \uparrow \]

\((b)\) \[ + \sum F_y = 0: \quad R_A + R_B = 0 \quad R_B = -R_A \]

\[ + \sum M_B = 0: \quad M_B + M_0 - R_A L = 0 \quad M_B + M_0 - \frac{3}{2} \frac{M_0}{L^2}(L^2-a^2) = 0 \]

\[ M_B = \frac{3M_0}{2L^2} \left( L^2-a^2 - \frac{2}{3} L^2 \right) \]

\[ M_B = \frac{M_0}{2L^2}(L^2-3a^2) \downarrow \]
PROBLEM 9.83

For the beam shown, determine the reaction at B.

SOLUTION

Beam is second degree indeterminate. Choose \( R_B \) and \( M_B \) as redundant reactions.

Loading I: Case 1 of Appendix D.

\[
(y_B)_I = \frac{R_B L^3}{3EI} \quad (\theta_B)_I = \frac{R_B L^2}{2EI}
\]

Loading II: Case 3 of Appendix D.

\[
(y_B)_{II} = -\frac{M_B L^2}{2EI} \quad (\theta_B)_{II} = -\frac{M_B L}{EI}
\]

Loading III: Case 2 of Appendix D.

\[
(y_B)_{III} = -\frac{wL^4}{8EI} \quad (\theta_B)_{III} = -\frac{wL^2}{6EI}
\]

Superposition and constraint:

\[
y_B = (y_B)_I + (y_B)_{II} + (y_B)_{III} = 0
\]

\[
\frac{L^3}{3EI} R_B - \frac{L^2}{2EI} M_B - \frac{wL^4}{8EI} = 0 \quad (1)
\]

\[
\theta_B = (\theta_B)_I + (\theta_B)_{II} + (\theta_B)_{III} = 0
\]

\[
\frac{L^2}{2EI} R_B - \frac{L}{EI} M_B - \frac{wL^3}{6EI} = 0 \quad (2)
\]

Solving Eqs. (1) and (2) simultaneously,

\[
R_B = \frac{1}{2} wL \uparrow
\]

\[
M_B = \frac{1}{12} wL^2 \downarrow
\]
PROBLEM 9.84

For the beam shown, determine the reaction at B.

SOLUTION

Beam is second degree indeterminate. Choose $R_B$ and $M_B$ as redundant reactions.

**Loading I:** Case 1 of Appendix D.

\[ (y_B)_I = -\frac{R_B L^3}{3EI}, \quad (\theta_B)_I = -\frac{R_B L^2}{2EI} \]

**Loading II:** Case 3 of Appendix D.

\[ (y_B)_II = \frac{M_B L^2}{2EI}, \quad (\theta_B)_II = \frac{M_B L}{EI} \]

**Loading III:** Case 3 applied to portion $AC$.

\[ (y_C)_III = \frac{M_0 (L/2)^2}{2EI} = \frac{M_0 L^2}{8EI} \]

\[ (\theta_C)_III = \frac{M_0 (L/2)}{EI} = \frac{M_0 L}{2EI} \]

Portion $CB$ remains straight.

\[ (y_B)_III = (y_C)_III + \frac{L}{2} (\theta_C)_III = \frac{3}{8} \frac{M_0 L^2}{EI} \]

\[ (\theta_B)_III = (\theta_C)_III = \frac{1}{2} \frac{M_0 L^2}{EI} \]

Superposition and constraint:

\[ y_B = (y_B)_I + (y_B)_II + (y_B)_III = 0 \]

\[ -\frac{L^3}{3EI} R_B + \frac{L^2}{2EI} M_B + \frac{3}{8} \frac{M_0 L^2}{EI} = 0 \]  \hspace{1cm} (1)

**PROBLEM 9.85**

A central beam $BD$ is joined at hinges to two cantilever beams $AB$ and $DE$. All beams have the cross section shown. For the loading shown, determine the largest $w$ so that the deflection at $C$ does not exceed 3 mm. Use $E = 200$ GPa.

---

**SOLUTION**

Let $a = 0.4$ m.

Cantilever beams $AB$ and $CD$.

Cases 1 and 2 of Appendix D.

$$y_B = y_D = \frac{(wa)a^3}{3EI} - \frac{wa^4}{8EI} = \frac{11}{24} \frac{wa^4}{EI}$$

Beam $BCD$, with $L = 0.8$ m, assuming that points $B$ and $D$ do not move.

Case 6 of Appendix D.

$$y_C' = -\frac{5wL^4}{384EI}$$

Additional deflection due to movement of points $B$ and $D$.

$$y_C = y_C' + y_C^*$$

$$y_C = y_C' - \frac{11}{24} \frac{wa^4}{EI}$$

Total deflection at $C$.

$$y_C = \frac{w}{EI} \left( \frac{5L^4}{384} + \frac{11a^4}{24} \right)$$

Data:

$$E = 200 \times 10^9 \text{ Pa},$$

$$I = \frac{1}{12} (24)(12)^3 = 3.456 \times 10^{-3} \text{ mm}^4 = 3.456 \times 10^{-9} \text{ m}^4$$

$$EI = (200 \times 10^9)(3.456 \times 10^{-9}) = 691.2 \text{ N} \cdot \text{m}^2$$

$$y_C = -3 \times 10^{-3} \text{ m}$$

$$-3 \times 10^{-3} = -\frac{w}{691.2} \left( \frac{5(0.8)^4}{384} + \frac{(11)(0.4)^4}{24} \right) = -24.69 \times 10^{-6} w$$

$$w = 121.5 \text{ N/m}$$

PROBLEM 9.86

The two beams shown have the same cross section and are joined by a hinge at C. For the loading shown, determine (a) the slope at point A, (b) the deflection at point B. Use \( E = 29 \times 10^6 \) psi.

SOLUTION

Using free body ABC,

\[ \sum M_A = 0: \quad 18R_C - (12)(800) = 0 \quad R_C = 533.33 \text{ lb} \]
\[ E = 29 \times 10^6 \text{ psi} \]
\[ I = \frac{1}{12}bh^3 = \frac{1}{12}(1.25)(1.25)^3 = 0.20345 \text{ in}^4 \]
\[ EI = (29 \times 10^6)(0.20345) = 5.900 \times 10^6 \text{ lb} \cdot \text{in}^2 \]

Using cantilever beam CD with load \( R_C \),

Case 1 of Appendix D.

\[ y_C = -\frac{R_CL_{CD}^3}{3EI} = -\frac{(533.33)(12)^3}{(3)(5.900 \times 10^6)} = -52.067 \times 10^{-3} \text{ in.} \]

Calculation of \( \theta'_A \) and \( y'_B \) assuming that point C does not move.

Case 5 of Appendix D.

\[ P = 800 \text{ lb,} \quad L = 18 \text{ in.,} \quad a = 12 \text{ in.,} \quad b = 6 \text{ in.} \]
\[ \theta'_A = -\frac{Pb(L^2 - b^2)}{6EI} = -\frac{(800)(6)(18^2 - 6^2)}{(6)(5.900 \times 10^6)(18)} = -2.1695 \times 10^{-3} \text{ rad} \]
\[ y'_B = -\frac{Pb^2a^2}{3EI} = -\frac{(800)(6)^2(12)^2}{(3)(5.900 \times 10^6)(18)} = -13.017 \times 10^{-3} \text{ in.} \]

Additional slope and deflection due to movement of point C.

\[ \theta''_A = \frac{y_C}{L_{AC}} = \frac{52.067 \times 10^{-3}}{18} = -2.8926 \times 10^{-3} \text{ rad} \]
\[ y''_A = \frac{a}{L}y_C = -\frac{(12)(52.067 \times 10^{-3})}{18} = -34.711 \times 10^{-3} \text{ in.} \]

(a) Slope at A. \( \theta_A = \theta'_A + \theta''_A = -2.1695 \times 10^{-3} - 2.8926 \times 10^{-3} \]
\( \theta_A = 5.06 \times 10^{-3} \text{ rad} \)

(b) Deflection at B. \( y_B = y'_B + y''_B = -13.017 \times 10^{-3} - 34.711 \times 10^{-3} \]
\( y_B = 0.0477 \text{ in.} \)
PROBLEM 9.87

Beam CE rests on beam AB as shown. Knowing that a W10 × 30 rolled-steel shape is used for each beam, determine for the loading shown the deflection at point D. Use \( E = 29 \times 10^6 \) psi.

SOLUTION

For W10 × 30, \( I = 170 \text{in}^4 \)

\[
EI = (29 \times 10^6)(170) = 4.93 \times 10^9 \text{lb} \cdot \text{in}^2 = 34,236 \text{kip} \cdot \text{ft}^2
\]

Beam AB: 15 kip downward loads at C and E.
Refer to Case 5 of Appendix D.

Loading I: \( (y_C)_1 = -\frac{Pd^2b^2}{3EI} \)
with \( a = 2 \text{ft}, \ b = 10 \text{ft}, \ L = 12 \text{ft} \)
\[
(y_C)_1 = -\frac{(15)(2)^2(10)^2}{(3)(34,236)(12)} = -4.8682 \times 10^{-3} \text{ft}
\]

Loading II: \( (y_C)_2 = -\frac{Pbx^2}{6EI} - \frac{(L^2-b^2)x}{12} \)
with \( b = 2 \text{ft}, \ x = 2 \text{ft}, \ L = 12 \text{ft} \)
\[
(y_C)_2 = \frac{(15)(2)[2^3 - (12^2 - 2^2)(2)]}{(6)(34,236)(12)} = -3.3104 \times 10^{-3} \text{ft}
\]
\[
y_C = (y_C)_1 + (y_C)_2 = -8.1786 \times 10^{-3} \text{ft}
\]

By symmetry, \( y_E = y_C \)

Beam CDE: 30 kip downward loads at D.
Refer to Case 4 of Appendix D.

\[
y_{D/C} = -\frac{PL^3}{48EI}
\]
with \( P = 30 \text{kips} \) and \( L = 8 \text{ft} \)
\[
y_{D/C} = -\frac{(30)(8)^3}{(48)(34,236)} = -9.3469 \times 10^{-3} \text{ft}
\]

Total deflection at D:
\[
y_D = y_C + y_{D/C} = 17.5255 \times 10^{-3} \text{ft} \quad y_D = 0.210 \text{in.} \downarrow
\]
PROBLEM 9.88

Beam $AC$ rests on the cantilever beam $DE$ as shown. Knowing that a W410 $\times$ 38.8 rolled-steel shape is used for each beam, determine for the loading shown $(a)$ the deflection at point $B$, $(b)$ the deflection at point $D$. Use $E = 200$ GPa.

SOLUTION

Units: Forces in kN; lengths in m.

Using free body $ABC$,

$$
\sum M_A = 0: \quad 4.4 R_C - (4.4)(30)(2.2) = 0
$$

$$R_C = 66.0 \text{ kN}$$

$$E = 200 \times 10^9 \text{ Pa}$$

$$I = 125 \times 10^6 \text{ mm}^4 = 125 \times 10^{-6} \text{ m}^4$$

$$EI = (200 \times 10^9)(125 \times 10^{-6}) = 25.0 \times 10^{-6} \text{ N} \cdot \text{m}^2$$

$$= 25,000 \text{ kN} \cdot \text{m}^2$$

For slope and deflection at $C$, use Case 1 of Appendix $D$ applied to portion $CE$ of beam $DCE$.

$$\theta_C = \frac{RCL^2}{2EI} = \frac{(66.0)(2.2)^2}{(2)(25,000)} = 6.3888 \times 10^{-3} \text{ rad}$$

$$y_C = -\frac{RCL^3}{3EI} = \frac{(66.0)(2.2)^3}{(3)(25,000)} = -9.3702 \times 10^{-3} \text{ m}$$

Deflection at $B$, assuming that point $C$ does not move.

Use Case 6 of Appendix $D$.

$$(y_B)_1 = -\frac{5WL^4}{384EI} = -\frac{(5)(30)(4.4)^4}{(384)(25,000)} = -5.8564 \times 10^{-3}$$

Additional deflection at $B$ due to movement of point $C$:

$$(y_B)_2 = \frac{1}{2} y_C = -4.6851 \times 10^{-3} \text{ m}$$

$(a)$ Total deflection at $B$:

$$y_B = (y_B)_1 + (y_B)_2 = -10.54 \times 10^{-3} \text{ m} \quad y_B = 10.54 \text{ mm} \downarrow$$

Portion $DC$ of beam $DCB$ remains straight.

$(b)$ Deflection at $D$:

$$y_D = y_C - a\theta_C = -9.3702 \times 10^{-3} - (2.2)(6.3888 \times 10^{-3}) = -23.4 \times 10^{-3} \text{ m}$$

$$y_D = 23.4 \text{ mm} \downarrow$$
**PROBLEM 9.89**

Before the 2-kip/ft load is applied, a gap, $\delta_0 = 0.8$ in., exists between the W16×40 beam and the support at C. Knowing that $E = 29 \times 10^6$ psi, determine the reaction at each support after the uniformly distributed load is applied.

**SOLUTION**

Data:

$\delta_0 = 0.8$ in. = $66.667 \times 10^{-3}$ ft

$E = 29 \times 10^6$ psi = $29 \times 10^3$ ksi

$I = 518$ in$^4$

$EI = 15.022 \times 10^6$ kip⋅in$^2$

$= 104.319 \times 10^3$ kip⋅ft$^2$

Loading I: Case 6 of Appendix D.

$$y'_c = \frac{5wL^4}{384EI} = \frac{5(24)^4}{384(104.319 \times 10^3)} = -82.823 \times 10^{-3} \text{ ft}$$

Loading II: Case 4 of Appendix D.

$$y''_c = \frac{R_c L^3}{48EI} = \frac{R_c (24)^3}{48(104.319 \times 10^3)} = 2.7608 \times 10^{-3} R_c$$

Deflection at C.

$$y_c = y'_c + y''_c = -\delta_0$$

$$-82.823 \times 10^{-3} + 2.7608 \times 10^{-3} R_c = -66.667 \times 10^{-3}$$

$$R_c = 5.8519 \text{ kips}$$

$$\Sigma M_B = 0: \quad (2)(24)(12) - R_A(24) - (5.8519)(12) = 0$$

$$R_A = 21.074 \text{ kips}$$

$$\Sigma F_y = 0: \quad 21.074 - 2(24) + 5.8519 + R_B = 0$$

$$R_B = 21.1 \text{ kips}$$
PROBLEM 9.90

The cantilever beam BC is attached to the steel cable AB as shown. Knowing that the cable is initially taut, determine the tension in the cable caused by the distributed load shown. Use \( E = 200 \text{ GPa} \).

SOLUTION

Let \( P \) be the tension developed in member AB and \( \delta_B \) be the elongation of that member.

Cable AB:

\[
A = 255 \text{ mm}^2 = 255 \times 10^{-6} \text{ m}^2
\]

\[
\delta_B = \frac{PL}{EA} = \frac{(P)(3)}{(200 \times 10^9)(255 \times 10^{-6})} = 58.82 \times 10^{-9} P
\]

Beam BC:

\[
I = 156 \times 10^6 \text{ mm}^4 = 156 \times 10^{-6} \text{ m}^4
\]

\[
EI = (200 \times 10^9)(156 \times 10^{-6}) = 31.2 \times 10^6 \text{ N} \cdot \text{m}^2
\]

Loading I: 20 kN/m downward.

Refer to Case 2 of Appendix D.

\[
(y_B)_1 = -\frac{wL^4}{8EI} = -\frac{(20 \times 10^3)(6)^4}{(8)(31.2 \times 10^6)} = -103.846 \times 10^{-3} \text{ m}
\]

Loading II: Upward force \( P \) at Point B.

Refer to Case 1 of Appendix D.

\[
(y_B)_2 = \frac{PL^3}{3EI} = \frac{P(6)^3}{(3)(31.2 \times 10^6)} = 2.3077 \times 10^{-6} P
\]

By superposition,

\[
y_B = (y_B)_1 + (y_B)_2
\]

Also, matching the deflection at B,

\[
y_B = -\delta_B
\]

\[
-103.846 \times 10^{-3} + 2.3077 \times 10^{-6} P = -58.82 \times 10^{-9} P
\]

\[
2.3666 \times 10^{-6} P = 103.846 \times 10^{-3}
\]

\[
P = 43.9 \times 10^3 \text{ N}
\]

\[
P = 43.9 \text{ kN}
\]
PROBLEM 9.91

Before the load $P$ was applied, a gap, $\delta_0 = 0.5\text{mm}$, existed between the cantilever beam $AC$ and the support at $B$. Knowing that $E = 200$ GPa, determine the magnitude of $P$ for which the deflection at $C$ is $1\text{mm}$. 

SOLUTION

Let length $AB = L = 0.5\text{ m}$

length $BC = a = 0.2\text{ m}$

Consider portion $AB$ of beam $ABC$.

The loading becomes forces $P$ and $R_B$ at $B$ plus the couple $Pa$. The deflection at $B$ is $\delta_0$. Using Cases 1 and 3 of Appendix $D$,

$$ \delta_0 = \frac{(P - R_B)L^3}{3EI} + \frac{PaL^2}{2EI} + \left(\frac{L^3}{3} + \frac{L^2a}{2}\right)P - \frac{L^3}{3}R_B = EI\delta_0 \tag{1} $$

The deflection at $C$ depends on the deformation of beam $ABC$ subjected to loads $P$ and $R_B$. For loading I, using Case 1 of Appendix $D$,

$$(\delta_C)_I = \frac{P(L + a)^3}{3EI}$$

For loading II, using Case 1 of Appendix $D$,

$$y_B = \frac{R_BL^3}{3EI}, \quad \theta_B = \frac{R_BL^2}{2EI}$$

Portion $BC$ remains straight.

$$y_C = y_B + a\theta_B = \left(\frac{L^3}{3} + \frac{L^2a}{2}\right)\frac{R_B}{EI}$$

By superposition, the downward deflection at $C$ is

$$\delta_C = \frac{P(L + a)^3}{3EI} - \left(\frac{L^3}{3} + \frac{L^2a}{2}\right)\frac{R_B}{EI}$$

$$\frac{(L + a)^3}{3}P - \left(\frac{L^3}{3} + \frac{L^2a}{2}\right)R_B = EI\delta_C \tag{2}$$

\[
I = \frac{1}{12} (60)(60)^3 = 1.08 \times 10^6 \text{ mm}^4 = 1.08 \times 10^{-6} \text{ m}^4
\]

\( EI = 216 \times 10^3 \text{ N} \cdot \text{ m}^2 \)

\( \delta_0 = 0.5 \times 10^{-3} \text{ m} \quad \delta_C = 1.0 \times 10^{-3} \text{ m} \)

Using the data, eqs (1) and (2) become

\[
0.06667 P - 0.04167 R_B = 108 \quad \text{(1)'}
\]

\[
0.11433 P - 0.06667 R_B = 216 \quad \text{(2)'}

Solving simultaneously,

\[
P = 5.63 \times 10^3 \text{ N}

\[
P = 5.63 \text{ kN} \downarrow

\[
R_B = 6.42 \times 10^3 \text{ N}

PROBLEM 9.92

For the loading shown, knowing that beams $AC$ and $BD$ have the same flexural rigidity, determine the reaction at $B$.

SOLUTION

Consider the two beams shown at the right.

Let $R_C$ be the contact force between beams $AC$ and $BCD$.

Applying Cases 1 and 2 of Appendix D to cantilever beam $AC$, 

\[ y_C = \frac{R_c a^3}{3EI} - \frac{wa^4}{8EI} \]

Applying Case 4 of Appendix D to simply supported beam $BCD$, 

\[ y_C = \frac{R_c L^3}{48EI} \]

Equating expressions for $y_C$, 

\[
\frac{R_c a^3}{3EI} - \frac{wa^4}{8EI} = \frac{R_c L^3}{48EI} \\
(16a^3 + L^3)R_c = 6wa^4 \\
R_c = \frac{6wa}{16 + \frac{L^3}{a^3}}
\]

Data: \( w = 50 \text{ lb/in}, \ a = 25 \text{ in}, \ L = 20 + 20 = 40 \text{ in.} \)

\[ R_C = \frac{(6)(50)(25)}{16 + (40/25)^3} = 373.21 \text{ lb} \]

Using beam $BCD$ as a free body, 

\[
\sum M_D = 0: \quad -R_B L + R_C \frac{L}{2} = 0 \\
R_B = \frac{1}{2} R_C = 186.6 \text{ lb} \uparrow

PROBLEM 9.93

A \( \frac{7}{8} \)-in.-diameter rod \( BC \) is attached to the lever \( AB \) and to the fixed support at \( C \). Lever \( AB \) has a uniform cross section \( \frac{3}{8} \) in. thick and 1 in. deep. For the loading shown, determine the deflection of point \( A \). Use \( E = 29 \times 10^6 \) psi and \( G = 11.2 \times 10^6 \) psi.

SOLUTION

Deformation of rod \( BC \). (Torsion)

\[
c = \frac{1}{2} \quad d = \frac{1}{2} \left( \frac{7}{8} \right) = 0.4375 \text{ in.}
\]

\[
J = \frac{\pi}{2} C^4 = 57.548 \times 10^{-3} \text{ in}^4
\]

\[
T = Pa = (80)(10) = 800 \text{ lb} \cdot \text{in}
\]

\[
L = 20 \text{ in.}
\]

\[
\phi_B = \frac{TL}{GJ} = \frac{(800)(20)}{(11.2 \times 10^6)(57.548 \times 10^{-3})}
\]

\[
= 24.824 \times 10^{-3} \text{ rad}
\]

Deflection of point \( A \) assuming lever \( AB \) to be rigid.

\[
(y_A)_1 = a\phi_B = (10)(24.824 \times 10^{-3})
\]

\[
= 0.24824 \text{ in.}
\]

Additional deflection due to bending of lever \( AB \).

Refer to Case 1 of Appendix \( D \).

\[
I = \frac{1}{12} \left( \frac{3}{8} \right)(1)^3 = 31.25 \times 10^{-3} \text{ in}^4
\]

\[
(y_A)_2 = \frac{PL^3}{3EI} = \frac{(80)(10)^3}{(3)(29 \times 10^6)(31.25 \times 10^{-3})}
\]

\[
= 0.02943 \text{ in.}
\]

Total deflection at point \( A \).

\[
y_A = (y_A)_1 + (y_A)_2
\]

\[
y_A = 0.278 \text{ in.}
\]
PROBLEM 9.94

A 16-mm-diameter rod has been bent into the shape shown. Determine the deflection of end C after the 200-N force is applied. Use $E = 200$ GPa and $G = 80$ GPa.

SOLUTION

Let $200$ N = $P$.

Consider torsion of rod $AB$.

$$\phi_B = \frac{TL}{JG} = \frac{(PL)L}{JG} = \frac{PL^2}{JG}$$

$$y'_C = -L\phi_B = -\frac{PL^3}{JG}$$

Consider bending of $AB$. (Case 1 of Appendix D.)

$$y''_C = y_B = -\frac{PL^3}{3EI}$$

Consider bending of $BC$. (Case 1 of Appendix D.)

$$y'''_C = -\frac{PL^3}{3EI}$$

Superposition:

$$y_C = y'_C + y''_C + y'''_C$$

$$= -\frac{PL^3}{JG} - \frac{PL^3}{3EI} - \frac{PL^3}{3EI} = -\frac{PL^3}{EI} \left( \frac{EI}{JG} + \frac{2}{3} \right)$$

Data:

$$G = 80(10^9) \text{ Pa} \quad J = \frac{1}{2} \pi (0.008)^4 = 6.4340(10^{-9}) \text{ m}^4$$

$$E = 200(10^9) \text{ Pa} \quad I = \frac{1}{2} J = 3.2170(10^{-9}) \text{ m}^4$$

$$EI = 643.40 \text{ N} \cdot \text{m}^2 \quad JG = 514.72 \text{ N} \cdot \text{m}^2$$

$$y_C = -\frac{(200)(0.25)}{643.40} \left( \frac{643.40}{514.72} + \frac{2}{3} \right) = -9.3093(10^{-3}) \text{ m}$$

$$y_C = 9.31 \text{ mm}$$

SOLUTION

Place reference tangent at $B$.

$$\theta_B = 0$$

$$\Sigma M_B = 0: \left( \frac{1}{2} w_0 L \right) \frac{L}{3} + M_B = 0$$

$$M_B = -\frac{1}{6} w_0 L^2$$

Draw $M/EI$ curve as cubic parabola.

$$A = -\frac{1}{4} \left( \frac{1}{6} \frac{w_0 L^2}{E I} \right) L = -\frac{1}{24} \frac{w_0 L^3}{E I}$$

$$\bar{x} = L - \frac{1}{5} L = \frac{4}{5} L$$

By first moment-area theorem,

$$\theta_{B/A} = A = -\frac{1}{24} \frac{w_0 L^3}{E I}$$

$$\theta_B = \theta_A + \theta_{B/A}$$

$$\theta_A = \theta_B - \theta_{B/A} = 0 + \frac{1}{24} \frac{w_0 L^3}{E I} = \frac{1}{24} \frac{w_0 L^3}{E I}$$

By second moment-area theorem,

\[ \bar{x} = L - \frac{1}{4}L = \frac{3}{4}L \]

By first moment-area theorem,

\[ \theta_{B/A} = A = -\frac{1}{6} \frac{wL^3}{EI} \]

\[ \theta_B = \theta_A + \theta_{B/A} \]

\[ \theta_A = \theta_B - \theta_{B/A} = 0 + \frac{1}{6} \frac{wL^3}{EI} = \frac{1}{6} \frac{wL^3}{EI} \]

By second moment-area theorem,

\[ \theta_A = \theta_C - \theta_{C/A} = 0 - (A_1 + A_2 + A_3) \]
\[ \theta_A = -(19.5313 \times 10^{-3} - 7.8125 \times 10^{-3} - 6.5105 \times 10^{-3}) = -5.21 \times 10^{-3} \]

(b) Deflection at $C$.

\[ |y_C| = t_{A/C} \]

\[ y_C = 21.2 \text{ mm} \]
PROBLEM 9.118

For the beam and loading shown, determine (a) the slope at end \( A \), (b) the deflection at the midpoint of the beam. Use \( E = 200 \) GPa.

SOLUTION

Use units of kN and m.

For S250 \( \times \) 37.8

\[
I = 51.2 \times 10^6 \text{mm}^4 = 51.2 \times 10^{-6} \text{m}^4
\]

\[
EI = (200 \times 10^9)(51.2 \times 10^{-6})
\]

\[
= 10.24 \times 10^6 \text{ N} \cdot \text{m}^2 = 10,240 \text{ kN} \cdot \text{m}^2
\]

Place reference tangent at midpoint \( C \).

Reactions: \( R_A = R_E = \frac{1}{2}(40)(3.6 - 1.2) = 48 \) kN ↑

Draw bending moment diagram of left half of beam by parts.

\[
M_1 = (48)(1.8) = 86.4 \text{ kN} \cdot \text{m}
\]

\[
A_1 = \frac{1}{2}(1.8)(86.4) = 77.76 \text{ kN} \cdot \text{m}^2
\]

\[
A_2 = (1.8)(-10) = -18 \text{ kN} \cdot \text{m}^2
\]

\[
M_3 = \frac{1}{2}(40)(1.8 - 0.6)^2 = -28.8 \text{ kN} \cdot \text{m}
\]

\[
A_3 = \frac{1}{3}(1.2)(-28.8) = -11.52 \text{ kN} \cdot \text{m}^2
\]

\[
\bar{x} = \frac{1}{4}(1.2) = 0.30 \text{ m}
\]

(a) Slope at end \( A \).

\[
\theta_A = -\frac{A_1}{EI} - \frac{A_2}{EI} - \frac{A_3}{EI} = \frac{-77.76 + 18 + 11.52}{10,240}
\]

\[
= -4.71 \times 10^{-3} \text{rad}
\]

\( \theta_A = 4.71 \times 10^{-3} \text{rad} \)

Use units of kN and m.

For W460×74,

$$I = 333 \times 10^6 \text{mm}^4 = 333 \times 10^{-6} \text{m}^4$$

$$EI = (200 \times 10^9)(333 \times 10^{-6}) = 66.6 \times 10^6 \text{N} \cdot \text{m}^2 = 66600 \text{kN} \cdot \text{m}^2$$

$$A_1 = \left(\frac{1}{2}\right)(2)(300) = 300 \text{kN} \cdot \text{m}^2$$

$$A_2 = (0.5)(300) = 150 \text{kN} \cdot \text{m}^2$$

$$M_3 = -60 \text{kN} \cdot \text{m}$$

$$A_4 = (2.5)(-60) = -150 \text{kN} \cdot \text{m}^2$$

$$= \frac{400 + 337.5 - 187.5}{66600} = 8.26 \times 10^{-3} \text{m}$$

PROBLEM 9.121

For the beam and loading of Prob. 9.117, determine the value of \( w \) for which the deflection is zero at the midpoint \( C \) of the beam. Use \( E = 200 \text{ GPa} \).

SOLUTION

Symmetric beam and loading:

\[ R_A = R_B = 5w \quad (w \text{ in kN/m}) \]

Bending moment in kN\(\cdot\)m:

\[ M = 5wx - 40 - \frac{1}{2}wx^2 \]

At \( x = 5 \text{ m} \),

\[ M = 25w - 40 - 12.5w \]

Draw \( M/EI \) diagram by parts.

\[
A_1 = \frac{1}{2} \left( \frac{25w}{EI} \right)(5) = \frac{62.5w}{EI}

\[
A_2 = -\left( \frac{40(5)}{EI} \right) = -\frac{200}{EI}
\]

\[
A_3 = -\frac{1}{3} \left( \frac{12.5w}{EI} \right)(5) = -\frac{20.833w}{EI}
\]

\[
\bar{x}_1 = \frac{2}{3}(5) = 3.3333 \text{ m}
\]

\[
\bar{x}_2 = \frac{1}{2}(5) = 2.5 \text{ m}

\[
\bar{x}_3 = \frac{3}{4}(5) = 3.75 \text{ m}

Place reference tangent at \( C \).

Deflection at \( C \) is zero.

\[
t_{y/C} = y_A - y_C = 0
\]

\[
A_1\bar{x}_1 + A_2\bar{x}_2 + A_3\bar{x}_3 = 0

\[
\left( \frac{62.5w}{EI} \right)(3.3333) - \left( \frac{200}{EI} \right)(2.5) - \left( \frac{20.833w}{EI} \right)(3.75) = 0

PROBLEM 9.122

For the beam and loading of Prob 9.120, determine the magnitude of the forces $P$ for which the deflection is zero at end $A$ of the beam. Use $E = 29 \times 10^6$ psi.

SOLUTION

Symmetric beam and loading:

$R_A = R_B = P + 2.5$ \hspace{1cm} (P in kips)

Bending moment:

Over $AB$: \hspace{1cm} $M = -Px$

Over $BC$: \hspace{1cm} $M = -Px + (P + 2.5)(x - 3)$

At $x = 8$ ft, \hspace{1cm} $M = 12.5 - P(3)$

Draw $\frac{M}{EI}$ diagram by parts.

$A_1 = \frac{1}{2} \left( \frac{12.5}{EI} \right) (5) = \frac{31.25}{EI}$

$A_2 = -\frac{1}{2} \left( \frac{3P}{EI} \right) (3) = -\frac{4.5P}{EI}$

$A_3 = -\left( \frac{3P}{EI} \right) (5) = -\frac{15P}{EI}$

Place reference tangent at $C$.

$y_A = y_B = 0 \hspace{1cm} y_A - y_B = 0 \hspace{1cm} t_{A/C} - t_{B/C} = 0$

A uniform rod \( AE \) is to be supported at two points \( B \) and \( D \). Determine the distance \( a \) for which the slope at ends \( A \) and \( E \) is zero.

SOLUTION

Let \( w = \text{weight per unit length of rod} \).

Symmetric beam and loading:

M_2 &= \frac{1}{2EI} w(\frac{L}{2})^2 = \frac{1}{8EI} wL^2 \\
A_1 &= \frac{1}{2EI} \left( \frac{L}{2} - a \right) = \frac{1}{16EI} wL(L - 2a)^2 \\
A_2 &= \frac{1}{3EI} \left( \frac{M_2}{2} \right) \frac{L}{2} = \frac{1}{48EI} wL^3

Let \( u = \frac{a}{L} \) and divide by \( \frac{wL^3}{48EI} \).

(a) **Slope at B.**

$$\theta_B = -\frac{t_{DB}}{L} = -\frac{0.024395}{0.5EI} = -\frac{0.048789}{EI}$$

$$\theta_B = 3.61 \times 10^{-3} \text{ rad}$$

$$t_{AB} = A_2\left(\frac{2}{3} \cdot (0.20)\right) = 0.0032/EI = 0.23704 \times 10^{-3} \text{ m}$$

(b) **Deflection at A.**

$$y_A = t_{AB} - L_{AB}\theta_B$$

$$y_A = 0.960 \text{ mm}$$

PROBLEM 9.142

For the beam and loading of Prob. 9.127, determine the magnitude and location of the largest downward deflection.

SOLUTION

From Prob. 9.127:

\[ \theta_A = -\frac{7w_0L^3}{360EI} \]

\[ A_1 = \frac{1}{2}\left( \frac{w_0L}{6EI}x_m^2 \right)(x_m) - \frac{w_0Lx_m^2}{12EI} \]

\[ A_2 = \frac{1}{4}\left( -\frac{w_0x_m^4}{6EI} \right)(x_m) = -\frac{w_0x_m^4}{24EIL} \]

Maximum deflection occurs at \( K \), where \( \theta_K = 0 \).

\[ \theta_K = \theta_A + \theta_{KA} = \theta_A + A_1 + A_2 \]

\[ 0 = \frac{7w_0L^3}{360EI} + \frac{w_0Lx_m^2}{12EI} - \frac{w_0x_m^4}{24EIL} \]

Rearranging:

\[ 0 = \frac{w_0L^2}{360EI}\left[ -7 + 30\left( \frac{x_m}{L} \right)^2 - 15\left( \frac{x_m}{L} \right)^4 \right] \]

Solving biquadratic:

\[ \left( \frac{x_m}{L} \right)^2 = 0.26970 \]

\[ x_m = 0.51933L \]

\[ y_m \text{ is } 0.519L \text{ from } A. \]

\[ t_{AK} = A_1 \frac{2x_m}{3} + A_2 \frac{4x_m}{5} = \left( \frac{w_0Lx_m^2}{12EI} \right) \frac{2x_m}{3} + \left( -\frac{w_0x_m^4}{24EIL} \right) \frac{4x_m}{5} \]

\[ = \frac{w_0L^4}{90EI}\left[ 5\left( \frac{x_m}{L} \right)^3 - 3\left( \frac{x_m}{L} \right)^5 \right] = \frac{w_0L^4}{90EI}\left[ 5(0.51933)^3 - 3(0.51933)^5 \right] \]

\[ = 0.0065222\frac{w_0L^4}{EI} \]

\[ y_m = |t_{AK}| \]

\[ y_m = 6.52 \times 10^{-3}\frac{w_0L^4}{EI} \]
PROBLEM 9.143

For the beam and loading of Prob. 9.129, determine the magnitude and location of the largest downward deflection.

SOLUTION

Referring to the solution to Prob. 9.129,

\[ EI = 14,160 \text{ kN} \cdot \text{m}^2 \]

\[ R_A = 40 \text{ kN}, \quad A_1 = \frac{45}{EI} \]

\[ t_{B/A} = \frac{742.5}{EI} \text{ m} \]

\[ \theta_A = -\frac{123.75}{EI} \]

Let \( K \) be the location of the maximum deflection. Assume that \( K \) lies between \( C \) and \( D \).

\[ \theta_K = \theta_A + \theta_{K/A} \]

\[ = -\frac{123.75}{EI} + A_1 + A_4 \]

\[ = -\frac{123.75}{EI} + \frac{45}{EI} + \frac{60u}{EI} = 0 \]

\[ u = \frac{123.75 - 45}{60} = 1.3125 \text{ m} \]

\[ x_K = 1.5 + u = 2.8125 \text{ m} \]

\[ t_{K/A} = A_1(u + 0.5) + A_4\left(\frac{1}{2}u\right) \]

\[ = \frac{45}{EI}(1.8125) + \frac{(60)(1.3125)\left(\frac{1}{2}\right)(1.3125)}{EI} = \frac{133.242}{EI} \]

\[ y_K = t_{K/A} - \frac{L}{L}t_{B/A} \]

\[ = \frac{133.242}{EI} - \frac{2.8125}{6}\left(\frac{742.5}{EI}\right) = -\frac{214.80}{14,160} = 15.17 \times 10^{-3} \text{ m} \]

\[ y_K = 15.17 \text{ mm} \downarrow \]

\[ x_K = 2.81 \text{ m} \]

PROBLEM 9.144

For the beam and loading of Prob. 9.131, determine the magnitude and location of the largest downward deflection.

SOLUTION

From the solution to Prob. 9.130,

\[ EI = 41083 \text{ kip} \cdot \text{ft}^2 \]
\[ R_A = 18.4 \text{ kips} \]
\[ A_1 = 331.2 \text{ kip} \cdot \text{ft}^2 \]
\[ A_3 = -53.333 \text{ kip} \cdot \text{ft}^3 \]
\[ \theta_A = -5.3096 \times 10^{-3} \]

\[ \theta_E = \theta_A + \theta_{EA} \]
\[ \theta_{EA} = \frac{1}{EI} \{A_1 + A_3\} = \frac{278.767}{41083} = 6.7855 \times 10^{-3} \]
\[ \theta_E = 1.4759 \times 10^{-3} \]

Since \( \theta_E > 0 \), the point \( K \) of zero slope lies to the left of point \( E \). Let \( x_K \) be the coordinate of point \( K \).

\[ A_6 = \frac{1}{2} R_A x_K^2 = 9.2 x_K^2 \]
\[ A_7 = -\frac{1}{6} (5(x_K - 2)^3) \]

\[ \theta_K = \theta_A + \theta_{K/A} = \theta_A + \frac{1}{EI} \{A_6 + A_7\} = 0 \]

\[ A_6 + A_7 + EI\theta_A = 0 \]

\[ f(x_K) = 9.2 x_K^2 - \frac{5}{6} (x_K - 2)^3 - 218.134 = 0 \]

PROBLEM 9.146

For the beam and loading of Prob. 9.137, determine the largest upward deflection in span $DE$.

SOLUTION

Units: Forces in lbs; lengths in inches.

From the solution to Prob. 9.137,

$EI = 450.4 \times 10^3$ lb·in

$M_1 = 1.33215 \times 10^3$ in$^{-1}$

$M_2 = -3.99645 \times 10^3$ in$^{-1}$

$\theta_D = 5.3286 \times 10^{-3}$

Location of maximum deflection:

$M_3 = \frac{M_1}{EI} \left(1 - \frac{u}{24}\right)$

$M_4 = \frac{M_2}{EI} \frac{u}{24}$

$A_5 = \frac{1}{2} \frac{M_1}{EI}, u = 0.666075 \times 10^{-3} u$

$A_6 = \frac{1}{2} \frac{M_3}{EI} \left(\frac{u}{24}\right) = 0.666075 \times 10^{-3} \left(1 - \frac{u}{24}\right) u$

$A_7 = \frac{1}{2} \frac{M_4}{EI} \frac{u}{24} = -1.998225 \times 10^{-3} \left(\frac{u}{24}\right) u$

$\theta_K = \theta_D + A_5 + A_6 + A_7 = 0$

Multiply by $10^3$.

$5.3286 + 0.666075u + 0.666075 \left(1 - \frac{u}{24}\right) u - (1.998225) \frac{u}{24} u = 0$

$5.3286 + 1.33215u - 0.1110125u^2 = 0$

PROBLEM 9.156

For the beam and loading shown, determine the spring constant $k$ for which the bending moment at $B$ is $M_B = -wL^2/10$.

SOLUTION

Using free body $AB$,

$$M_B = 0: \quad -R_A L + (wL)\left(\frac{L}{2}\right) - \frac{1}{10}wL^2 = 0$$

$$F = \frac{6}{5}wL$$

Draw $M/EI$ diagram by parts.

$$A_1 = \frac{1}{2}\left(\frac{2}{5} \frac{wL^2}{EI}\right)L = \frac{1}{5} \frac{wL^3}{EI}$$

\[ [x = 0, \ M = 0] \quad 0 = 0 + 0 + C_2 \quad \therefore \quad C_2 = 0 \]

\[ EI \frac{d^2 y}{dx^2} = M = - \frac{w_0}{3L} x^3 + \frac{w_0}{2} x^2 \]

\[ EI \frac{dy}{dx} = - \frac{w_0}{12L} x^4 + \frac{w_0}{6} x^3 + C_3 \]

(a) Elastic curve.

\[ y = - \frac{w_0}{120EI} \left( 2x^5 - 5Lx^4 + 10L^4x - 7L^5 \right) \]

[x = 0, \ \frac{dy}{dx} = 0] & \quad [x = L, \ \frac{dy}{dx} = 0]
\end{align*}
\]

SOLUTION

Reactions are statically indeterminate.

By symmetry, 
\( R_B = R_A; \ M_B = M_A \)

\[
\begin{align*}

Over entire beam,
\( M = M_A + R_A x - \frac{1}{2} w x^2 \)

\[
\begin{align*}
&\quad EI \frac{d^2 y}{dx^2} = M_A + \frac{1}{2} wLx - \frac{1}{2} w x^2 \\
&\quad EI \frac{dy}{dx} = M_A x + \frac{1}{4} wLx^2 - \frac{1}{6} w x^3 + C_1

\]

\[
\begin{align*}
[x = 0, \ \frac{dy}{dx} = 0] & \quad 0 + 0 - 0 + C_1 = 0 \quad C_1 = 0 \quad M_A = -\frac{1}{12} wL^2 \quad M = w[6x(L - x) - L^2]/12

\[
\begin{align*}
[x = \frac{L}{2}, \ \frac{dy}{dx} = 0] & \quad \frac{1}{2} M_A L + \frac{1}{16} wL^3 - \frac{1}{48} wL^2 + 0 = 0

SOLUTION

Use units of kips and ft. $P = 7$ kips

For $S6 \times 12.5$, $I = 22.0 \text{ in}^4$

$$EI = (29 \times 10^6)(22.0) = 638 \times 10^6 \text{ lb} \cdot \text{in}^2$$

Draw the bending moment diagram by parts for the left half of the beam.

$M_1 = (4.5)(5) = 22.5 \text{ kip} \cdot \text{ft}$

$$A_1 = \frac{1}{2}(4.5)(22.5) = 50.625 \text{ kip} \cdot \text{ft}^2$$

$$M_2 = -(2 + 4.5)(1.5) = -9.75 \text{ kip} \cdot \text{ft}$$

$$M_3 = -(2)(1.5) = -3 \text{ kip} \cdot \text{ft}$$

$$A_3 = \frac{1}{2}(2)(-3) = -3 \text{ kip} \cdot \text{ft}^2$$

Formulas:

$\theta_A = -\theta_{C/A}$, $y_A - y_C = t_{A/C}$, $y_C = y_A - t_{A/C}$

$$y_B = y_A - 2\theta_A + t_{B/A} = 0, \quad y_A = -2\theta_A - t_{B/A}$$

$$\theta_{C/A} = \frac{1}{EI}(A_1 + A_2) = \frac{50.625 - 31.6875}{4430.6} = 4.27425 \times 10^{-3}$$

$$t_{A/C} = \frac{1}{EI}\left[(2 + 3)A_1 + \frac{2}{3}(6.5)A_2\right] = \frac{115.8125}{4430.6} = 26.1392 \times 10^{-3} \text{ ft}$$

$$t_{B/A} = \frac{1}{EI}\left[\frac{1}{3}(2)A_3\right] = \frac{-2}{4430.6} = -0.45141 \times 10^{-3} \text{ ft}$$

PROBLEM 9.168

A hydraulic jack can be used to raise point B of the cantilever beam ABC. The beam was originally straight, horizontal, and unloaded. A 20-kN load was then applied at point C, causing this point to move down. Determine (a) how much point B should be raised to return point C to its original position, (b) the final value of the reaction at B. Use $E = 200$ GPa.

SOLUTION

For W130 × 23.8, $I_x = 8.91 \times 10^6$ mm$^4$

$EI = (200 \times 10^6 \text{kPa})(8.91 \times 10^{-6} \text{m}^4) = 1782 \text{kN} \cdot \text{m}^2$

Let $R_B$ be the jack force in kN.

$A_1 = \frac{1}{2}(1.8R_B)(1.8) = 1.62R_B$

$A_2 = \frac{1}{2}(-60)(3) = -90 \text{kN} \cdot \text{m}^2$

$EI_{t_{C/A}} = (2.4)A_1 + (2)A_2$

$0 = (2.4)(1.62R_B) + (2)(-90)$

$R_B = 46.296 \text{kN}$

$A_3 = \frac{1}{2}(-60)(1.8) = -54 \text{kN} \cdot \text{m}^2$

$A_4 = \frac{1}{2}(-24)(1.8) = -21.6 \text{kN} \cdot \text{m}^2$

$EI_{t_{B/A}} = (1.2)A_1 + (1.2)A_3 + (0.6)A_4$

$= (1.2)(75) + (1.2)(-54) + (0.6)(-21.6)$

$= 12.24 \text{kN} \cdot \text{m}^2$

(a) Deflection at B.

$y_B = t_{B/A} = \frac{EI_{t_{B/A}}}{EI} = \frac{12.24}{1782} = 6.8687 \times 10^{-3} \text{m}$
